In the can system of ice-making, distilled water which has been freed of air is ordinarily used for freezing and this produces a cake of transparent and clear ice with the exception of a thin feather of air bubbles in the centre of the cake and a portion of the top of the cake which is white where the water expands over that first frozen. The distilled water from which ice is made is obtained by condensing the exhaust steam from the engine of the refrigerating machine and by condensing live steam. In an economical plant the steam required to run the engine and for other purposes is less than the amount of ice produced, and to make up the difference some live steam is admitted directly to the condenser in order to supply the necessary amount of distilled water. In an ice-making plant where the water is distilled by evaporating it in an ordinary boiler, the weight of ice made per pound of coal is, therefore, limited by the evaporation of the boiler and the amount of ice produced is less than the total amount of steam generated by what is lost through the drips from the steam pipes and other causes. It is possible, therefore, to make more ice per pound of coal by the plate system of ice-making where the water is not distilled than it is by a can system as ordinarily operated. In an economical compression plant where the ice is made by the can system a single cylinder engine working without a vacuum will require less steam to run it than the weight of ice which is produced, and if distilled water is used for freezing it will not increase the efficiency to employ a more economical engine. In a plate system, however, a compound engine may be used with a corresponding gain in the efficiency.

In order to make it possible in a can system to make a greater amount of distilled water ice than the weight of water evaporated by the boiler it has been proposed to use multiple-effect evaporators for distilling the water. This was done in a plant at Newark, N. J., but the system had to be abandoned on account of the evaporator becoming coated with a hard scale which was deposited from the water to such an extent that the evaporator soon fell off in its capacity and efficiency. Where the steam from the engine operating the refrigerating machine is condensed in order to obtain distilled water for making the ice, the oil which this water contains must be eliminated. This is accomplished by reboiling the water which comes from the condenser in an open tank by means of a jet of live steam; then cooling and run-

ning it through an oil separator and finally through charcoal filters. Reboiling the distilled water removes the air which it may contain. It is possible to so thoroughly remove the oil that there will be no traces of it in the ice, whereas, if this is done imperfectly, the centre of the cake, when freshly broken open, will have a slight smell resembling that of tar. The presence of a trace of oil can be detected by the odor when it cannot be detected by taste. In the plate system the ice is formed on the flat cooling surface to the depth of about six inches in two days, nine inches in four days and 12 inches in seven days. The plates are usually allowed to build up to about 12 inches thick before harvesting. They are then melted free from the cooling plate by passing hot ammonia gas under pressure into the cooling coil which by condensation supplies the necessary heat. After this the blocks of ice are cut to the size required by sawing or by a parting tool heated by steam. In some plate systems cold brine instead of ammonia is circulated through the cooling coils. In the plate system the water in contact with the freezing plates is agitated by means of compressed air which is admitted from a perforated pipe placed near the bottom of the tank. As the ice freezes from one side only it forces the impurities and the air contained in the water to its surface, and the circulation produced by the air bubbles floating upward through the water assists in removing the impurities and air bubbles from the surface. A clear transparent ice is thus produced.

In the so-called vacuum ice-making machines water is used as a working fluid, and it is cooled to the freezing point by its own evaporation. In these machines the water is injected into a refrigerating chamber in which a vacuum is maintained and a portion of the water is frozen by the cooling effect produced by the evaporation. In some machines the vacuum is maintained entirely by mechanical means and in others by the combination of an air pump and a reservoir of strong sulphuric acid for absorbing the water vapor. Where acid is used it is heated after it has become weak through the absorption of water vapor and after concentration is returned to the machine and used over again as an absorbent. Where a vacuum is maintained entirely by mechanical means a very large cylinder displacement is required in the air-pump. One machine constructed on this principle had a cylinder 20 feet in diameter and a stroke of 10 feet, and made 20 double strokes or revolutions per minute. The ice produced is white, opaque and hard. It is produced in large cakes and cut by a saw to the size required for commercial use.

REFRIGERATOR, a machine or apparatus employed to reduce temperature by chemical or mechanical means. In the restricted sense in which it is most familiarly understood, the term refers to any vessel or chamber in which animal and vegetable substances, solid or liquid, are kept, and are prevented from decaying or fermenting, by the presence of ice, or freezing mixtures, or by the circulation of currents of air or liquid furnished by a refrigerating machine. Domestic refrigerators of this character are made in a great variety of forms, ranging

Domestic Refrigerator.

from the common metal-lined wooden ice-box, provided with a tube to drain off the water from the melting ice in the ice chamber, to the large and elaborate ice-rooms used for extensive storage purposes.

Refrigerator cars employed to transport per-

ishable merchandise without deterioration over long distances may also be considered as belonging to this class. They were first operated in 1867, between Chicago and New York City, and succeeded in keeping the meat transported fresh and sweet through an interval of 10 days, during the hottest summer months. Each end of a car is provided with a chamber in which blocks of ice are packed on gratings in such a manner as to permit the circulation of a current of air, furnished by a blower driven by a belt on one of the axles, over the ice and through the storage space in the car. See **REFRIGERATION AND REFRIGERATING MACHINERY**.

REFUGE, Cities of, six Levitical cities divinely appointed as places of refuge to one who had committed manslaughter, and was pursued by the "Revenger" or "Avenger" of Blood. Three (Kedesh Naphtali, Shechem and Hebron) were west of the Jordan, and three (Bezer in Reuben, Ramoth Gilead in Gad, and Golan in the half-tribe of Manasseh) were east of that river. If the case was proved to be one of murder, the perpetrator might be taken from the City of Refuge and put to death; if it was only manslaughter, the refugee had to remain in the city to which he had fled till released by the death of the high priest (Num. xxx, 6-34; Josh. xx, 1-9).

It was provided that the cities of refuge should be easy of access, and every year, on the 15th of Adar, the magistrates inspected the roads to see that they were in good condition, and that there were no impediments. At every division of the road was a direction post for the guidance of him who was fleeing for security. Those in flight were to be well supplied with water and provisions, and it was necessary that all should understand a trade so as not to become public charges. At the death of the high priest the refugee might quit the city in which he had sought security, but, according to Num. xxxv, 12, he had to stand trial to determine whether the murder was truly casual and involuntary. If pronounced innocent he was permitted to remain in safety; if otherwise he was put to death according to the law.

REFUGEES, *rěf'ū-jēs'*, a name commonly applied to political or religious exiles, but originally and particularly to the French Protestants who fled from their native country on account of the persecutions to which they were exposed after the repeal in 1685 of the Edict of Nantes under which the reformed doctrines had enjoyed toleration from the year 1598. About 800,000 Protestants fled from their native countries, England, Denmark, Holland, Switzerland, Germany, in the latter especially Saxony, Brandenburg and Hesse, received these fugitives with hospitality. In the Civil War in the United States the term was applied to those negroes, the South who before and after Lincoln's Emancipation proclamation sought freedom in the Northern States. See **HUGUENOTS**.

REFUNDERS. See **READJUSTERS**.

REGATTA, originally a gondola race held annually with great pomp in Venice on canals intersecting the city. The term is now popularly employed in the United States and other countries to signify a showy sailing or rowing race, in which a number of yachts or boats contend for prizes.

REGLATION, *rě-jě-lá'shón*, a phenomenon observed by Faraday in 1850, namely, that two pieces of moist ice placed in contact will freeze together, even in a warm atmosphere. It is proved that beside the pressure from the weight of the upper piece of ice there is atmospheric pressure holding the two pieces together; this pressure melts the ice at the parts which bear on one another, and thus enough heat is absorbed to produce regelation. A snowball is formed by the regelation of the particles composing it; so also are the snow bridges spanning chasms on high mountains. The phenomena or regelation are easily seen in the making of snow balls, which is well known to be impossible, by the hands at least, when the snow has been exposed to great cold, and is therefore dry. Professor Thomson's discovery, that the freezing-point is lowered by pressure, explains the motions of glaciers and the apparent plasticity of ice under pressure.

REGENERATION, the act or the state of being born again in a spiritual sense. The word is a literal version of the term *paligenesia*, peculiar to the New Testament, in which it occurs twice only, namely, Mat. xix, 28, where it signifies the renovation of all things at the second coming of Messiah; and Titus iii, 5, "washing of regeneration," where it signifies a new life, a new spirit in the individual redeemed soul. In many other passages of the New Testament, and specially in John iii, 1-10, the new birth is spoken of without the use of the word regeneration, but in such terms as plainly to indicate that the soul which is received into the kingdom of Christ is born into a new life. Regarding the relation of the sacrament of baptism to the new birth there are chiefly two divergent views entertained by divines. One view, which till the Reformation was well nigh universal, and which is still held by the Catholic Church as an article of faith, regards baptism as the agency whereby the Holy Spirit bestows the new life. According to the other view the washing of water in baptism is but a sensible representation of the spiritual new birth, and regeneration is effected independently of baptism by the direct action of the Holy Spirit. The first view is called that of "baptismal regeneration." Article XXVII of the Articles of Religion of the Church of England teaches that baptism is "a sign of regeneration whereby, as by an instrument, they that receive baptism are grafted into the Church"; but in 1849, by a judgment of the Privy Council, it was decided that in the Established Church of England Baptismal Regeneration is not a doctrine taught in her articles and formularies as legally construed. See MAN, CHRISTIAN ANTHROPOLOGY.

REGENERATION, in zoology, signifies the reproduction, or natural restoration, of parts of the body, whether external or internal, lost by injury. This power of renewal belongs in some degree to all living creatures, and is one of the distinguishing features of organic, as distinct from inorganic, nature. A broken crystal may rebuild itself when it is allowed to remain for a suitable time in a saturated solution of the mineral of which it consists; but this renewal is accomplished wholly by external accretion of new material, whereas an animal supplies a lost part wholly by the ordinary process of food-assimilation and growth.

This power is most manifest, as might be predicted, in the animals of the simplest organization, and in those most exposed to serious mutilation, and decreases in a varying scale as organisms become more and more complex, until in the higher vertebrates (except lizards) it is limited to the healing of wounds. (The success of what surgeons call *grafting*, that is, the organic attachment of new flesh to old, as when detached skin is placed over a flayed surface, might be classified here, but it is an artificial utilization of the regenerative principle).

Among such lowly animals as protozoans, coelenterates, echinoderms and worms, the power of regeneration is very great and of much importance, although it appears with much inequality and with some strange irregularities; among crustaceans it is strong in some groups and not in others; and among the vertebrates is confined mainly to the amphibians and the lizards.

As long ago as the middle of the 18th century it was learned that if a hydra be sliced into thin cross-sections from each ring would sprout a fringe of tentacles, and when cut lengthwise into strips each strip would form for itself a complete hydra. The same thing happens when protozoans, and even some worms, are dissected. "If," says Morgan, "a fresh-water worm (*Lumbriculus*) is cut into pieces, each piece makes a new head at its anterior end, and a new tail at the posterior end; in this way as many new worms are produced as there are pieces." Not all worms are so energetic. Thus in the common earthworm the cutting must be done carefully. "If from one to five of the anterior segments be cut off," according to Packard, "the same number comes back; if more are cut off the process of regeneration begins only after a longer interval, and only four or five segments come back as a rule; if the cut be behind the middle . . . fewer worms succeed in regenerating at all." In the case of another annelid (*Allolobophora*) allied to the earthworm, when cut in two in the middle the posterior piece "regenerates at its anterior end and not a head but a tail." This is one of the many curious examples of inconsistency or irregularity in this function. In the hydroids the presence or absence of light has much to do with the form regeneration will take, and elsewhere other external conditions are influential.

Among the echinoderms regeneration is most conspicuous in the starfishes. Before this ability was generally known the oystermen of Long Island Sound, whose planted oyster-beds were infested with destructive starfishes, used to catch great numbers of them by dragging "tangles"; piling them on the deck of the boat they would, as an easy means of dispatching them quickly, saw through the heaps by pulling a coarse cord and then throw the severed halves overboard. The result was that each half of the starfish (unless its centre was utterly ruined) put forth new arms, and thus the number of pests was doubled instead of decreased. Now the starfishes caught are taken ashore and turned into fertilizer.

Crabs and other crustaceans will develop new limbs to replace lost ones. "If," says Calman ('Life of Crustacea,' 1911), "a lobster be caught by one of its claws or by a leg, it very

readily parts with the limb in its struggles to escape"; and he explains that the connection at the joint of the second and third segments is slight, and that there is only a small hole through which blood vessels and nerves pass to the distal segments, and this is quickly plugged by a blood-clot. "Beneath the scar which forms on the stump of a separated limb a sort of bud grows, and gradually assumes the form of the lost segments . . . and ultimately provides in normal cases a new member, similar in every detail to that which has been lost."

Amphibians, especially salamanders and the young frogs, suffer greatly from mutilation, not only by enemies who catch them by the tail or a limb, which may be lost in the effort to escape (in some cases by voluntary sloughing off of tail or gills), but by the biting of their own fellows, especially when many larvæ are associated. Salamanders are particularly subject to loss or mutilation of their long tails. These, and lost hands, are restored in the course of three or four months; but in place of the bones that formerly existed in the part a similar cartilaginous framework only is supplied. Fully grown frogs are slower than the young and often the restoration is incomplete.

The same is true of lizards, whose tails are frequently torn or cast off and regenerated. The new structure is, however, as Gadow says, "a sham tail, since neither new centra nor arches [of the vertebræ] but only a non-segmented rod or tube of fibro-cartilage is produced." Gadow ('Amphibia,' 1901) continues: "The regenerated tail is, however, provided with new muscles, and with skin, but the scales often differ considerably from those of the normal organ. Boulenger has found that the new aberrant scaling is in some cases a reversion to an ancestral form. This, for instance, is the case in *Pseudopus*, and in the tejoïd genus *Gymnophthalmus*; to a certain extent also in geckos and skinks. On the other hand *Lacertidæ*, *Gerrhosauridæ* and also *Anguidæ*, reproduce a caudal scaling true to their type. Injured or broken-off tails are often reproduced double or even trifid; sometimes an additional little tail grows out from an injured spot, anywhere on the side of an injured or mended tail."

Turtles will mend injured plates of their shell, or in some cases are able to reproduce a plate wholly lost.

The physiological process or method by which regeneration is effected through the cells at the surface of the injury or amputation is still a matter of theory. The latest statement of the power of regeneration manifested by the cells concerned is that by Henry Fairfield Osborne ('Origin of Life and Evolution,' 1917), who believes that such "regeneration is attributable to the potentiality of the hereditary chromatin which still resides in the cells of the amputated surfaces." It has been argued by some of the stricter followers of Darwin that this power of regeneration is an acquirement through natural selection, but Morgan shows conclusively that this view is untenable. He speaks of the healing of wounds, which occurs in all animals, and asserts that its higher manifestation in the restoration of lost limbs is adaptive in character. "The immense usefulness of this power," Morgan reminds us, "is obvious when it is remembered how exposed

most animals are to injuries. By repairing the injury the animal can better carry on its normal functions. Moreover the presence of the wound would give injurious bacteria a ready means of entering the body. In fact, an intact skin is one of the best preventives to the entrance of bacteria." Consult Morgan, T. H., 'Regeneration' (New York 1901).

REGENERATION IN PLANTS. See PLANTS, REGENERATION IN.

REGENSBURG, rā'gēns-boorg, See RATISBON.

REGENT, rē'jēnt, in a general sense, is a ruler, the ruler of a state; in a more limited sense, one who exercises the highest power vicariously during the absence or incapacity of the lawful sovereign.

In the United States the term regent has two very special applications, viz.: (1) The Smithsonian Institution in Washington, D. C., is under the direction of a board of regents comprising the President of the United States, Chief Justice of the Supreme Court, three members each of the Senate and House of Representatives, and six citizens appointed by joint resolution of the Congress; (2) the University of the State of New York, a supervising, not a teaching, institution, is under the direction of a board of regents, elected by the legislature, by whom all charters of academies, colleges, universities, libraries and museums in the State are issued.

REGENT-BIRD, a bird of eastern Australia (*Sericulus chrysocephalus*), allied to the bower-birds, which derives its name from the golden color of the head. The bower of the Regent bird (which derives its popular name from the fact that it was discovered during the regency of the Prince of Wales, afterward George IV) is smaller and less dome-shaped than that of the Satin-bird. It is sometimes, but erroneously called the Regent-oriole. The males possess a brilliant plumage of glossy satin-like texture and of black and yellow colors, but the females are dingy in appearance. The regent-birds are of very shy habits, and inhabit the forest depths, making bowers less complicated and striking than those of some other bower-birds (q.v.), but for the same purpose. The food consists of fruits and seeds principally. One of the honey-eaters is called mock regent-bird on account of its black and yellow plumage.

REGENT DIAMOND. See DIAMOND.

REGENT'S PARK, London, England, one of the principal metropolitan pleasure-grounds, covering 470 acres, in the western boroughs of Marylebone and Saint Pancras. The Zoological Gardens are in the northern section of the park, and the Royal Botanic Gardens occupy a circular area in the southern section. See LONDON.

REGER, rā'gēr, Max, German composer: b. Brand, Bavaria, 19 March 1873; d. Jena, 12 March 1916. He removed with his family to Weiden in 1874, and received his early musical training under his father and an organist named Lindner. In 1890-95 he studied under Riemann at Sondershausen and at the Conservatorium at Wiesbaden. He was a teacher at the Conservatorium in 1895-96, performed mili-

tary service in 1896-97, and in 1901 settled in Munich. He went to Leipzig in 1907, becoming director at the university and teacher of composition at the Conservatory, and in 1908 he became professor at the university. In 1911 he was appointed court conductor of the Meiningen Orchestra by the Duke of Meiningen. He occupied a foremost place among modern German composers of chamber and church music and by many critics is considered the logical successor of the great German masters, Bach, Beethoven and Brahms. His work was highly individual and his facility in the art of counterpoint remarkable; although the complexities of his expression in harmony, rhythm and form are at times difficult to follow, even for experienced listeners. His power of invention was extraordinary and the volume of his compositions enormous, his Opus 100 being completed when he was 34. His works for the organ are ranked next to Bach's. Besides chamber music, choral works with orchestra, piano pieces and several hundred songs he made numerous transcriptions of songs, orchestral and organ works for the piano. Among his organ works are 'Fantasie and Fugue in C minor' (Op. 29); 'Sonata, F sharp minor' (Op. 33); 'Fantasie and Fugue on Bach' (Op. 46); 'Variations and Fugue on an Original Theme' (Op. 73); 'Introduction, Passacaglia and Fugue' (Op. 127); his works for the pianoforte include 'Improvisation' (Op. 18); 'Aquarellen' (Op. 25); 'Sonata for piano and violin' (Op. 72); 'Sonata for piano and violoncello in F' (Op. 78), and among his orchestral works are 'Sinfonietta' (Op. 90; his first opus for orchestra); 'Ouvverture zu einem Lustspiel' (Op. 120); 'Klavierkonzert' (Op. 114). He explained something of his method in 'Beiträge zur Modulationstheorie' (1903).

REGGIO DI CALABRIA, rēd'jō dē kā-lā-brē-ā, Italy: (1) capital of a province of same name, a seaport town opposite Messina at the extreme southern point of the peninsula. Reggio was founded by Greek colonists in the 8th century becoming later a Roman possession. Ancient Græco-Roman baths were recently revealed in excavating. It fell alternately into the hands of Saracens, Spaniards and Turks, and in 1783 and 1908 its ruin was almost completed by earthquakes. Its chief industries are the manufacture of essential oils, olive oil, silk and printing. Pop. 43,162. (2) The province is rugged and mountainous, covering an area of 1,219 square miles; pop. 469,071.

REGGIO NELL' EMILIA, nēl lā-mēl'lē-ā, Italy, (1) capital of the province of the same name, 38 miles northwest of Bologna, on the canal of Tassone. It is well-built and enterprising. Its chief points of interest are its ancient walls and ramparts, cathedral and library. Ariosto and Spallanzani (qq.v.) were born in Reggio. Pop. (1915) 75,349. (2) The province lies between Parma on the west and Modena on the east. Its southwest portion is covered by the Apennines. The opposite portion is flat and alluvial, bordering the Po. Area, 885 square miles; pop. 326,487.

REGICIDE, a term applied to persons who bring about the death of a king, by assassination or otherwise and specially applied in history to the judges of Charles I, and the members of the French Convention who voted for

the death of Louis XVI. Of the judges, 67 in number, who actually sat in trial on Charles I, only 59 signed the death warrant. After the Restoration the regicides were brought to trial on a charge of high treason. Twenty-nine were condemned to death, but only 10 were executed, 19, together with six others who were not tried, being imprisoned, most of them for life. More than 20 who were already dead were tried and condemned, notwithstanding, and Cromwell, Ireton and Bradshaw, three of them, were exhumed and hanged at Tyburn and then reburied at the foot of the scaffold.

In July 1660, there arrived at Cambridge, Mass., Edward Whalley and his son-in-law, William Goffe, two of the judges who had condemned Charles I. For some months they appeared in public and joined in the devotional meetings in Cambridge and Boston, where they were kindly received. Upon the news of the passage by Parliament of the Indemnity Act, marking Whalley and Goffe for vengeance as regicides, they fled to New Haven and were received and concealed by Davenport in the "Judges' Cave." They were concealed from pursuit at New Haven and Milford for nearly two years. After this they fled to a cave in New Hampshire, but were there discovered by some Indians and returned to Hadley, Mass., where they were concealed until their death, Whalley dying in 1674, Goffe in 1679. When King Philip attacked Hadley in 1675, Goffe appeared and led the defense. Dixwell, another regicide, also escaped to New England.

In the broad sense of assassinations of rulers under various titles we have since 1800 the following: Tsar Paul, Russia, 24 March 1801; President Lincoln, (died) 15 April 1865; Prince Michael, Serbia, 10 June 1868; Sultan Abdul-Aziz, Turkey, 4 June 1876; Tsar Alexander II, Russia, 13 March 1881; President Garfield, (died) 19 Sept. 1881; President Sadi Carnot, France, 24 June 1894; President Juan Idiarte, Uruguay, 25 Aug. 1897; President Heurcaux, Santo Domingo, 26 July 1899; King Humbert, Italy, 29 July 1900; President McKinley (died) 14 Sept. 1901; King Alexander, Serbia, 10 June 1903; King Carlos I, Portugal, 1 Feb. 1908; President Madero, Mexico, 23 Feb. 1913; King George, Greece, 18 March 1913; President Sam, Haiti, 28 July 1915.

REGILLUS, rē-jil'ūs, Lake, a lake of ancient Latium, lying to the southeast of Rome, noted as the scene of a great victory won by the Romans under Albinus Postumius, over the Latins, under Octavius Mamilius, on behalf of the banished Tarquin the Proud, 496 B.C. No certain identity has been established with any modern lake.

REGIMENT. In modern armies the regiment is a colonel's command and is the largest permanent association of soldiers. Regiments may be combined into brigades, brigades into divisions and divisions into armies; but these combinations are but temporary, while in the regiment the same officers serve continually and in command of the same body of men. The strength of a regiment may vary greatly even in the same army, as each may comprise any number of battalions. In the cavalry, field artillery and infantry arms the regiment is the administrative unit. The headquarters of the regiment are at the station of the permanent regi-

mental commander; in his absence the command of the regiment devolves upon the senior officer on duty with it wherever he may be stationed. The regiment is composed of two or more battalions which, in turn, are composed of two or more companies. The battalion, in a regiment, is not an administrative unit and has no separate records; it is purely a tactical unit conveniently organized for instruction or maneuver and particularly for combat, either as an integral part of the regiment to which it belongs or separated from it. It is appropriately commanded by a field officer, normally a major, regularly assigned in orders. In the absence of its regular commander the command devolves upon the senior officer of the battalion on duty with it, unless a field officer has been assigned. Whenever incomplete battalions of the same or different regiments are serving together, the commanding officer designates provisional battalions and similarly, in the case of the incomplete regiments, he designates provisional regiments. Under the new organization plan of 22 Sept. 1917, an infantry regiment in the United States army contains one headquarters and headquarters company (303), three battalions of four line companies each (3,078), one supply company (140), one machine-gun company (178), one medical detachment (56), making a total of 3,755 officers and men. For the composition of the companies, battalions, etc. See: ARMY ORGANIZATION.

REGINA, Canada, city and capital of the province of Saskatchewan and for many years previous to 1905 the capital of the North West Territories, the commercial, educational, social, political and industrial centre of that prairie country lying between Winnipeg and the Rocky Mountains and the largest city between Winnipeg (356 miles east) and Calgary (840 miles west). The main line of the Canadian Pacific Railway cuts the city from east to west. The Colonsay line of the same railway enters from the north and has its terminus there. The Bul-yea line of the Canadian Pacific Railway also connects Regina with the northern portion of the province east of Last Mountain Lake, and with the Kirkella branch serving the eastern portion of the province north of the Qu'Appelle Valley. The Arcola line of the Canadian Pacific Railway has its western terminus in Regina and serves the southeastern portion of the province. The Weyburn cut-off of the Canadian Pacific Railway connects Regina to the south and by connecting up with the new Lethbridge line opens up the whole of the southwestern portion of the province. It also brings Regina into direct connection with the Soo Line and thereby with Saint Paul, Minneapolis and other American cities. The Canadian National Railways have a line running east from Regina which connects with their main Transcontinental at Winnipeg. They also own the old Qu'Appelle, Long Lake and Saskatchewan Railway from Regina to Prince Albert and continuing on to the Hudson's Bay. Their line to Moose Jaw from Regina is a recent addition serving a rich stretch of country. The Grand Trunk Pacific has a line from Regina to Melville connecting with their main Transcontinental, one to Moose Jaw and another south to the international boundary line connecting with the

Great Northern. The chief industry of the Canadian west is agriculture and stock-raising, and Regina is the centre of both for Saskatchewan. The land is a rich clay loam, producing excellent crops of small grains and roots. Seed grain from the district is sold throughout the continent at excellent prices. Nearly all the great implement houses have headquarters for Western Canada in Regina and a few years ago the city held the record for implement sales for all the world. Regina may be said, therefore, to be the heart of the implement trade of the West. All the leading wholesale houses have branches in Regina and an immense volume of trade is done. The city has laid out a tract of property a mile long and half a mile deep for a wholesale and manufacturing district. This is served by all lines of railways operating in the district and is already over half full of permanent and substantial business structures. Among recent additions to this district are branches of the T. Eaton Company and the Robert Simpson Company, both of Toronto and the two largest enterprises of their kind in Canada. The Imperial Oil Company (Standard Oil) have a refining plant at Regina devoted to refining crude oil shipped in tank cars from Wyoming. The Canadian Continental Oil Company recently removed its headquarters to Regina.

A large Canadian pork-packing firm recently established a plant in Regina. Most of the great Canadian and many of the American financial houses have branches located in Regina. There are 15 branches of chartered banks and numerous trust companies. The bank clearings for 1910 were \$50,739,159, and for 1918 they were \$184,624,632. The city is governed by an elected mayor and 10 aldermen. Municipal ownership is at its best in Regina, the municipality owning and operating its own water plant, light plant and street railway. The city is well supplied with parks and beauty spots and it is prettily situated on the banks of Wascana Lake. Within easy motor distance are several noted summer resorts on the Qu'Appelle and Last Mountain lakes. Its educational facilities comprise a fine collegiate institute and two colleges (Methodist and Anglican) while Presbyterian and Roman Catholic colleges are projected. All religious denominations are well represented with large congregations and commodious churches. There are also numerous public buildings of magnificent proportion and architectural beauty.

The city was founded in 1883 and was originally called Pile of Bones, due to the great piles of buffalo bones in the vicinity. It grew slowly until 1905 when it rose by successive strides of healthy growth from 2,249 in 1891 to about 40,000 souls to-day. Headquarters for Canada of the Royal North West Mounted Police are located in Regina, as is also the military headquarters for the province. During the war of 1914-18 the city responded nobly, having sent four battalions into the field as fighting units and raised many men for reinforcements.

REGIOMONTANUS, rē'jī-ō-mōn-tā'nūs, German astronomer, whose real name was Johann Müller, but who assumed that of Regiomontanus, in allusion to the place of his birth, Königsberg (Kings Mountain), Fran-

conia: b. 6 June 1436; d. Rome, 6 July 1476. Having received a classical education at Leipzig, he placed himself under Purbachius (Georg von Purbach), the professor of mathematics at Vienna, and under him became one of the first astronomers of that age. With Purbachius he accompanied Cardinal Bessarion to Rome in 1461, where Beza gave him further instruction in Greek literature, and he now completed a new abridgment in Latin of the 'Almagest' of Ptolemy (1496), correcting many errors in the former translation, made by George of Trebizond. In 1471 he built an observatory at Nuremberg and established a press, but after three years returned to Rome on the invitation of Sixtus IV, who employed him in the reformation of the calendar and rewarded his services by raising him to the bishopric of Ratisbon (1475). He died, according to some, of the plague, according to others by poison administered by the son of George of Trebizond out of revenge for his having exposed the errors of his father. Regiomontanus was the first in Germany to apply himself to the cultivation of the neglected science of algebra. He made great improvements in trigonometry, into which he introduced the use of tangents. His refutation of a supposed discovery of the quadrature of the circle and numerous writings on various subjects of natural philosophy display extensive learning and great acuteness. His astronomical observations from 1475 to 1506 ('Ephemerides') are very accurate. Among his other works 'Kalendarium' (about 1474), 'De Reformatione Kalendarii' (1489); 'De Cometæ Magnitudine Longitudineque' (1531); 'De Triangulis Omnimodis' (1533); 'Tabulæ Directionum Projectionumque in Nativitatibus multum utiles' (1585). Consult Gunther, 'Johannes Müller' (in the 'Allgemeine deutsche Biographie,' Vol. XXII, 1855); also Ziegler, 'Regiomontanus als, geistiger Vorläufer des Columbus' (1874).

REGIONAL METAMORPHISM. See **METAMORPHISM.**

REGISTER, the title of a public officer who has charge of records, his duties varying in different States; a list of persons entitled to vote; a perforated plate governing the opening into a duct which admits warm air into a room for heat, or fresh air for ventilation, or which allows foul air to escape; in music, the compass of a voice or instrument. Also a device for automatically indicating the number of revolutions made or amount of work done by machinery; or recording steam, air or water pressure, or other data, by means of apparatus deriving motion from the object or objects whose force, distance, velocity, direction, elevation or numerical amount it is desired to ascertain. There are various appliances of this kind, each particularly adapted for the peculiar operation which is to be investigated; many depending on the action of clockwork mechanism, which indicates results on dials, but others, as in registering meteorological instruments, having means for recording varying conditions, as with the anemometer, barograph, etc. The cash register is a machine for recording money payments. It is of very general use in retail establishments throughout the world.

REGISTRATION OF BIRTHS, MARRIAGES AND DEATHS. France has the

most perfect system of registering births, marriages and deaths. There it is the duty wholly of the civil authority, and the methods are so thorough and comprehensive that it is practically impossible for a birth, a marriage or death to occur without going on record. In Great Britain no thorough system existed till 1836, when a general registration act was passed, applicable, however, only to England and Wales, which has been considerably amended since. In the United States, while there is no national law on the subject, the registration of births, marriages and deaths is universally required by State laws, but it is only in well-organized municipalities that it is fully enforced, and even there much depends on the willingness of doctor, minister or other civilian upon whom the law imposes the duty of making report to the authorities, to perform that duty. In rural and remote districts births, marriages and deaths often go unrecorded, thus causing doubt and uncertainty which may cast a cloud on property titles and the legitimacy of children. Claims to great age are often made more than doubtful by the lack of any authentic evidence as to date of birth. Indeed, owing to the lax methods of registration which prevailed up to the latter part of the 19th century it is almost impossible to establish the pretensions of alleged centenarians. The importance of registration has of late, however, impressed itself deeply on the public, and everywhere throughout the United States an improvement is being witnessed in this regard.

REGISTRATION OF PROPERTY TITLES. The United States leads the world in its system—which is practically the same everywhere throughout the Union—of recording property transfers. The possession of a deed of property is not proof of title. The title rests legally in the person in whose name it is recorded in the books of the register or recorder, or by whatsoever name the official having charge of such records is known. The first business, therefore, of a person acquiring property is to have the deed registered. Otherwise the former owner could sell the same property to another, and if the latter had received no notice of a previous transfer, and gave value for the estate, and had his deed recorded first, he could hold the property against the person who had received a previous deed, but had failed to put it on record. The officials in charge of the records are sometimes county and sometimes town and city officers, and the deed is recorded the moment it is received, even although not entered on the books for some time after. Therefore it is carefully stamped with the hour, minute and even second of its presentation. The old cumbersome English method of vesting title on a trunkful of deeds is, therefore, unknown in America, where registration has been the rule from the time of the earliest settlers, who allotted lands to each freeman, and made a record of the division.

Chattel mortgages are also recorded; otherwise the mortgagee is without protection against transfer to a third and innocent party who might purchase the goods, or advance money on them.

England has been slow to follow the example of the United States in this matter, but the convenience of the American system and

the cumbersomeness of the English, which was growing more top-heavy year by year, has led to the adoption of a method of voluntary registration which makes it possible to transfer and hold property without having to hand over or keep a mass of old title-deeds. In Scotland an excellent system for the registration of transfers of heritable property has existed since 1617.

REGISTRATION OF VOTERS. Unrestricted and general registration of voters is required by law in 40 of the American States, as a check to fraudulent voting; in two there are no registration requirements; in the others a restricted registration is required, as in cities and towns of specified population, in certain cities, towns and villages that have become incorporated, in cities but not in country precincts, etc. In some States a voter having once registered is not required to register again while he retains the same qualifications and residence. In the State of New York yearly registration is required in the large cities, while in the country districts it is not necessary. Previous to registration "repeating"—that is, voting more than once in one election—and other frauds were very common and probably affected the results of important political contests. The voter is required, as a rule, to give his name, age, residence, place of birth and, if of foreign birth, produce his naturalization papers, should the registering officials demand them. For a short time New York State had a law requiring the registry board to make a record of the physical defects of voters for identification, but this proved offensive and unpopular and was soon repealed. It is a penal offense to make a false statement in registering. See various articles dealing with voting and suffrage.

In Great Britain and on the Continent of Europe voters are required to register, a most exact scrutiny being enforced as to the possession of legal qualifications for the suffrage.

In England the registration of electors was first established by the Reform Act of 1832, in terms of which, in England, the overseers of each parish were required to draw up a register of all persons qualified to vote. This still forms the basis of procedure, but the law has been frequently altered, the latest act on the subject being the Registration Act of 1885.

REGISTRY BOARDS, Election of. See ELECTIONS; ELECTORAL QUALIFICATIONS; CONGRESS.

REGISTRY OF VESSELS, legal term applied to the record of United States merchant ships engaged in foreign trade, kept in the customs office of their home port. Ships engaged in coastwise or home trade are "enrolled," the terms "register" and "enrolment" being used to distinguish the two classes of vessels. The ship receives a registry certificate giving her home port, date of construction, name of owner, measurements and tonnage, her official number and signal letters. "Registry of tonnage" is the amount of weight a ship will carry as expressed in the official register.

REGIUM DONUM, ré'ji-üm dô'nüm ("royal gift"), an annual grant of public money formerly received by the Presbyterian and other Non-Conformist ministers in England, Scotland and Ireland. The Irish Regium Donum was withdrawn by the Act of 1869, which came

into force in 1871, disendowing the Irish Episcopal Church. Compensation was made of life interests, and the ministers were allowed to commute on the same terms as the clergy of the Church. In 1874 it was reported that the commutation money paid had amounted to \$2,898,810. The Regium Donum in England was enjoyed by the three denominations, Presbyterians, Independents and Baptists, from 1723 till 1851. The amount required was annually voted by Parliament till 17 July 1857. The Scotch Episcopalians also enjoyed for a time a small share.

REGIUS (rě'ji-ūs) **PROFESSORS,** the designation of professors at Oxford and Cambridge whose chairs were founded by Henry VIII. In the Scotch universities the name is given to professors who receive their appointments from the Crown.

REGLA, räg'lā, Cuba, town, province of La Habana, on Havana Harbor, opposite the city of Havana. It is connected with Havana by ferry, with Matanzas and other towns to the east by rail, and also has a street railway running to Guanabacoo. It contains foundries, shipyards and large sugar warehouses, and has a considerable trade, especially in the exporting of sugar. It contains a large bull ring, formerly the scene of the Havana bull fights. Pop. about 14,000.

REGNARD, rě-nār, Jean François, French comic dramatist: b. Paris, 1 Feb. 1655; d. Grillon, 4 Sept. 1709. He was the son of a rich merchant, and while on a voyage to Italy was captured by pirates and sold as a slave in Algiers. Being redeemed by his family he traveled extensively in Holland, Germany, Poland and Lapland. He wrote many comedies for the French stage, his first, 'Le Divorce,' was performed at the Theatre Italien in 1688. What is considered his masterpiece is 'Le Joueur' (1696), which holds a place second only to some of Molière's. Other pieces, produced at the Théâtre-Française, were 'La Sérénade' (1694); 'Le Bourgeois de Falaise' (1696); 'Le Distrain' (1697); 'Le Carnaval de Venice'—music by Campra—(1699); 'Democrite' (1700); 'Le Retour imprévu' (1700); 'Les Folies amoureuses' (1704); 'Les Ménéchmes' (1705). The best editions of his works are b. Didot (1820); Michiels (1854); Fourmieu (1875); Moland (1893).

REGNAULT, rě-nō, Alexandre George Henri, French painter: b. Paris, 30 Oct. 1844; d. Buzenval, 19 Jan. 1871. He was trained in art under Lamoignon and Cabanel; in 1866 carried off the Prize of Rome by his 'The Bringing Weapons to Achilles' and for the next two years lived in Italy, where he furnished illustrations to the 'Travels' of Francis Weh. He next visited Spain, where his passion for light and color was satisfied in studying the works of Goya and Velasquez, of whose 'Lanzas' he made a copy. In fact, his finest work of importance, a colossal equestrian portrait of General Prim (now in the Louvre), was executed at Madrid. He had a natural, temperamental preference for the features of a mental life, and he loved to paint incidents and scenes of horror. Of such a character is 'Salome,' a personification of bloodthirsty passion; and 'Decapitation in Granada'; two c.

vases of marvelous daring in color, but repulsive from their cold brutality. When the war of 1870 broke out he returned to France, enlisted and was killed at the battle of Buzenval, near Paris. The circumstances of his death have invested his name with a certain halo of glory in the eyes of his countrymen and have tended to impart an exaggerated importance to his artistic achievements. A monument to him by Chapu is seen in the École des Beaux Arts, Paris, and his 'Automedon with the Horses of Achilles,' in the Boston Museum of Fine Arts. Consult Cazalis, 'Henri Regnault, sa Vie et son Œuvre' (1872).

REGNAULT, Henri Victor, French chemist and physicist: b. Aix-la-Chapelle, Germany, 21 July 1810; d. Auteuil, France, 19 Jan. 1878. After study at the École Polytechnique of Paris, he became a mining engineer and later a professor at Lyons. His 'L'Action du Chlore sur l'Ether Chlorhydrique' (1840) won for him a professorship at the École and admission to the Academy of Sciences. In 1841 he was made professor of physics in the Collège de France, in 1847 chief mining engineer, and in 1854 director of the Sèvres porcelain manufactory. Among his writings, besides many scientific papers in 'Annales de Chimie' and other learned journals, are 'Cours Élémentaire de Chimie' (4 vols., 1849-50; 14th ed., 1871), and 'Premiers Éléments de Chimie' (1850; 6th ed. 1874). His great work on steam engines constitutes Vol. XXI of the 'Mémoires de l'Académie des Sciences.'

REGNAULT, Jean Baptiste, BARON, French painter: b. Paris, 19 Oct. 1754; d. there, 12 Nov. 1829. He studied under Bardin, won the grand medal with his 'Alexander and Diogenes' in 1774, and after capturing the Prix de Rome in 1776, entered the Academy in 1783 and became eventually a professor in the École des Beaux Arts (1795). The influence of David was predominant in his day, and Regnault's paintings are all in the conventionally classic manner of that master. Many of his works are in the Louvre, among them his 'Baptism of Christ,' and his most notable picture, the 'Education of Achilles.' Among his notable works are 'Perseus and Andromeda' (1782), and 'Cupid and Psyche' (1829). He also produced the historically interesting works, 'The Acceptance of the Constitution by Louis XVI'; 'Napoleon Proclaimed Consul for Life'; 'Battle of Marengo,' and 'The Death of Dessoix.'

RÉGNIER, ră-ně-ă, Henri François Joseph de, French poet: b. Honfleur, 28 Dec. 1864. He was numbered in his earlier days among the Parnassians and later was allied with Mallarmé and the symbolists. His admirers are found among the younger literary men rather than among the academic. Critics have found his verse excellent for a delicacy of taste and a kind of antique inspiration, but have blamed him for sacrificing too much of the sentiment or the idea to the last refinement of expression. He has published in verse 'Sites' (1887); 'Poèmes anciens, romanesques' (1890); 'Tel qu'en songe' (1892); 'Les Jeux rustiques et divins' (1897); 'Les Médailles d'Argile' (1900), etc., and the novels 'La Canne de Jaspé' (1895); 'Le Trèfle blanc' (1899); 'La double Maitresse' (1900).

REGNIER, Mathurin, French satirist: b. Chartres, 21 Dec. 1573; d. Rouen, 22 Oct. 1613. He was a nephew of the poet Desportes; served as secretary in Rome to the ambassadors Joyeuse and Béthune. Having taken orders as a youth he was granted a canonry at Rouen upon his return from Rome, but his dissipated habits shortened his life. He was famous for his satires in imitation of Horace, Juvenal and Martial, especially those in which he attacked Malherbe, the reigning literary authority of his day. He showed knowledge of life and character and a power in the expression of manners that in the opinion of Sainte-Beuve ranked him after Montaigne, Ronsard and Rabelais. No good edition of his works appeared in his lifetime; that published in 1608 and in 1613 was entitled 'Satires et autres Poésies de Maturin Régnier.' Numerous editions of his works have appeared, including those by Brossette (1729, 1736); Viollet-Leduc (1822, 1853); Barthélemy (1862); Lacour (1867), and Courbet (1869, 1875).

REGOLITH. See MANTLE ROCK.

REGULAR CANONS OF THE IMMACULATE CONCEPTION. See ORDERS, RELIGIOUS, *Immaculate Conception, Regular Canons of the.*

REGULAR CLERKS OF THE FAITH OF JESUS. See ORDERS, RELIGIOUS, *Baccanarists.*

REGULARITY, Political. See VOTE, VOTERS, VOTING.

REGULARS, in the Roman Catholic Church, persons of either sex who are members of any of the religious orders, congregations or institutes approved by the Holy See. Those of their number who are in holy orders constitute the Regular Clergy, that is, clergy under a religious rule (*regula*), who are bound by the usual three monastic vows, poverty, chastity and obedience: so contradistinguished from the secular clergy—those clergymen who do not belong to such orders or congregations.

REGULATION OF PUBLIC UTILITIES. See PUBLIC UTILITIES.

REGULATORS, a name adopted in South Carolina, about 10 years before the Revolution, by citizens who organized themselves to put down lawlessness and enforce respect for life and property. Their methods were very like those of the vigilance committees of California and Nevada, about a century later. The Regulators were pacified by the establishment of courts of law in the disturbed districts.

Some years later in North Carolina an organization calling themselves "Regulators" was formed to resist the extortion and oppression practised by officers of the colonial government. They drove out the local authorities, and Governor Tryon led a military force against them, defeating them after a sanguinary battle, near the Allernance Creek, 16 May 1771. Tryon hanged six of the Regulators for treason. The survivors generally took the patriot side in the War for Independence, and the "Regulator" movement in North Carolina is regarded by some as one of the beginnings of that struggle.

Consult 'Messages and Papers of the Presidents' (Vol. XX, 1914).

REGULUS, *rég'ū-lūs*, **Marcus Atilius**, Roman general of the 3d century B. C. He was made consul in 267 B. C., and a second time about 256 B. C. With his colleague, Manlius Vulso, he commanded in the first war against Carthage. With a fleet of 330 ships carrying 40,000 men the consuls defeated a superior Carthaginian fleet in the battle of Ecnomus and effected a landing in Africa. Here Regulus followed up his victories so successfully that in a short time he presented himself before the capital of the enemy. Carthage sued for peace and Regulus who wished to end the war before his successor was appointed demanded unconditional submission. The Carthaginians refusing the terms ended the negotiations and at this juncture were joined by a small body of Spartan volunteers under Xanthippus, to whom was given the command of the Carthaginian forces. In a battle under the walls of Carthage 30,000 Romans fell and Regulus was made prisoner 255. He remained in Carthage till 250, when the Carthaginians, having been defeated at Panormus, were desirous of peace. An embassy was, therefore, sent to Rome, accompanied by Regulus, who was obliged to bind himself by an oath to return to Carthage, if Rome should refuse the terms proposed. Regulus, however, advised the continuance of the war and recommended the Romans not to exchange prisoners. Thereupon he declined to listen to the entreaties of his family or of the Senate and persisted in his intention to return to Carthage. It is related that he was put to death with great cruelty and that Hamilcar and Boscar, two noble Carthaginian prisoners, were given up to the family of Regulus, who took revenge on them in a similar manner. Neither the story of the embassy nor of the revenge is related by Polybius, and Ihne, the German historian, inclines to the modern view that the story was invented to excuse the cruelty of the family of Regulus to their prisoners. Niebuhr declares the story a forgery and believes that Regulus died a natural death. Horace 'Odes' III, 5, repeats eloquently the story as current at the time.

REGULUS, the star Alpha Leonis, the brightest in the constellation of the Lion.

REGUR, a dark superficial soil of India, loam or clayey, occurring chiefly on the tableland of the Deccan and in Nagpur, less frequently in Mysore and reappearing in southern India in continuous sheets from 6 to 20 feet thick. Although generally a surface soil, it dips beneath recent alluvium. It is extremely fertile, having produced heavy crops, especially of cotton and corn, for many centuries without requiring manure. Its exact age is undetermined. The name is native.

REHAN, *rē'an*, **Ada** (originally **CREHAN**), American actress: b. Limerick, Ireland, 22 April 1860; d. New York, 8 Jan. 1916. She came to this country as a child and made her first appearance on the stage at 14 in Newark, N. J. She had not at that time, however, taken up acting as a profession, but continued her education in Brooklyn where her parents lived. She appeared for two seasons at Mrs. John Drew's theatre in Philadelphia, and later in stock companies in Baltimore, Albany and

Louisville. In 1879 she became a member of Augustine Daly's stock company first as leading lady and afterward as star, where she continued until Daly's death in 1899. Here she took part in many revivals of old comedy, together with a fewer number of modern plays, principally adaptations from the German made by Daly. Her greatest successes were Katharine in 'Taming of the Shrew' and Lady Teazle in 'School for Scandal,' though she played with acceptance Viola, Portia, Rosalind and Beatrice, Peggy Shrift in 'The Country Girl' and Agatha Posket in Pinero's 'The Magistrate.' After 1899 she appeared on the stage only at considerable intervals.

REHN, *rén*, **Frank Knox Martin**, American artist: b. Philadelphia, Pa., 12 April 1848; d. Magnolia, Mass., 7 July 1914. He studied at the Philadelphia Academy of Fine Arts and established a reputation as a painter of marines, landscapes and portraits. He attained his greatest successes as a painter of marines. He refrained from studying abroad believing that foreign study tended toward imitation of old masters rather than permitting the development of an individual American school of art. He was awarded honorable mention at the Paris Exposition in 1900 and gold medals at the New York Competitive Prize Fund Exhibition in 1885 and at the Philadelphia Society of Artists in 1907. He was elected a member of the National Academy in 1908. His most important figure piece is 'The Turkish Harem,' and among his marines are 'Missing Vessel' (Detroit Art Museum); 'Close of a Summer Day' (Buffalo Fine Arts Academy); 'The Derelict' (1892); 'A Moonlight Sea—Cape Ann' (1912); 'A Sunny Afternoon in the Gulf Stream' (1914).

REHOBOAM, *rē'hō-bō'am*, first king of Judah and, for a time after succeeding his father, king of all Israel, son of King Solomon and the Ammonitish Princess Naamah: b. 1014 B. C.; d. 956 B. C. He succeeded to the throne 973 B. C., and proceeded to Shechem for his coronation. There he was petitioned by the people for a remission of the heavy burdens imposed under Solomon's masterful reign; but, disregarding the advice of his elders, he not only refused the petitions, but announced his intention of being more severe than his father had been. The result was a revolt under the leadership of Jeroboam, who had returned from exile in Egypt. Rehoboam gathered an army of 180,000 men at Jerusalem with the purpose of reconquering Israel. He appears to have been outnumbered by the opposing forces, and his expedition was, moreover, forbidden by the prophet Shemaiah, who declared the division of the kingdom to be the will of God. Rehoboam acquiesced, strengthening his borders and becoming the first king of Judah, the division of the kingdom into two parts continuing to the end of both lines of monarchy. The pure worship of God was maintained in Judah, attracting many settlers from Israel, but Rehoboam did not put down the worship of Ashtoreth, which, according to the chroniclers, was visited with punishment through an Egyptian invasion under Shishak, or Sheshonk. Jerusalem was taken and Rehoboam secured an ignoble peace by delivering to the victor the treasures of King Solomon's temple and palace.

His reign was thereafter uneventful and he was succeeded by his son Abijah, or Abijam.

REICH, rik'h, Jacques, American artist: b. in Hungary, 10 Aug. 1852. He studied art in Budapest; came to the United States in 1873; continued his art education in New York and Philadelphia, and afterward studied in Paris. He returned to Philadelphia and became skilled in pen-and-ink drawings and in the etching of portraits on copper. In 1885 he removed to New York. He drew the greater number of the pen-portraits for Scribner's 'Cyclopædia of Painters and Paintings,' and also for Appleton's 'Cyclopædia of American Biography.' His other important work includes a series of portraits of American and English authors and other prominent persons, and half life-size plates of Washington (after the Gilbert Stuart unfinished painting), Jefferson (after the painting by Rembrandt) and President Roosevelt.

REICHA, rik'hä, Anton Joseph, Austrian composer: b. Prague, Austria, 27 Feb. 1770; d. Paris, France, 28 May 1836. He made a study of the violin, pianoforte and flute and in 1788 he entered the chapel of Maximilian of Austria as second flute. His ambition, however, was to become a composer and after overcoming many difficulties he succeeded in having his symphonies and other compositions played by his uncle's orchestra at the court of the Elector of Cologne. Reicha lived in Hamburg 1794-99 and there wrote his first opera, 'Obaldi, ou les Français en Egypte,' but failed to obtain its production in Hamburg or Paris, though several of his symphonies were well received. In 1802-08 he lived in Vienna, where he enjoyed the patronage of Maria Theresa and was intimate with Beethoven, Haydn and other great musicians. He removed to Paris in 1808, became professor at the Conservatoire in 1818, was naturalized in 1829 and elected to the Institute in 1835. He was chiefly notable for his chamber music and his theoretical work, though his symphonies and overtures met with considerable success. His operas were lacking in dramatic effect, though their music is excellent. He was also author of numerous theoretical works, among which may be mentioned 'Études ou Théories pour le Pianoforte, dirigées d'une Manière nouvelle' (1800); 'Traité de Melodie' (1814, 1832); 'Cours de composition musicale' (1818); 'Traité de haute Composition musicale' (1824, 1826), edited by Czerny in French and German as 'Vollständiges Lehrbuch' (4 vols., 1834); 'L'art du Compositeur dramatique' (1833); 'Petit traité d'harmonie pratique' (no date), etc.

REICHARDT, rik'härt, Johann Friedrich, German composer and author: b. Königsberg, 25 Nov. 1752; d. Giebichenstein, 27 June 1814. He studied in the universities of Königsberg and Leipzig; was appointed Kapellmeister by Frederick the Great in 1775, and during his tenure of office introduced Concerts Spirituels for the performance of novelties with analytical programs (1783). He conducted Italian opera under Friedrich Wilhelm II, but his French sympathies brought about his dismissal in 1794. He was court director at Cassel for a short time during the incumbency of the king of Westphalia. He holds an important place in the history of music from the fact that his Singspiele are factors in the development of

German opera, and his Lieder are among the earliest of their kind. He wrote operas, oratorios and cantatas, besides compositions for orchestra and pianoforte and set to music Bürger's translation of Macbeth, Goethe's Faust, Egmont and Tasso, besides many lyrics. He edited musical periodicals and, among other works, published 'Ueber die deutsche Komische Oper' (1774); 'Ueber die Pflichten des Ripienviolinisten' (1776); 'Schreiben über die Berlinische Musik' (1775); 'Vertraute Briefe aus Paris' (1804-05); 'Vertraute Briefe geschrieben auf einer Reise nach Wien' (2 vols., 1810).

REICHENBACH, rik'hën-bäch, Karl, BARON VON, German naturalist: b. Stuttgart, 12 Feb. 1788; d. Leipzig, 19 Jan. 1869. He studied at Tübingen, where he obtained the degree of doctor of philosophy, and was denounced to the Napoleonic police and imprisoned for having organized an association with the fanciful object of founding a German kingdom in the South Seas. He visited the principal iron works in France and Germany and established others of his own at Villingen and the first large German charcoal-burning establishment at Hausach in Baden. In 1821 he founded with Count Hugo zu Salm a number of industrial establishments in Moravia, from which he realized a considerable fortune. The king of Würtemberg raised him to the dignity of baron in 1839. In 1834 he published in Vienna 'Mittheilungen aus Mähren,' the first geological monograph in Austria. He is also credited with some chemical discoveries, in particular of paraffin and creosote. In the course of his studies of animal magnetism he believed he had discovered a new force, which he called *od* and upon which he published several works, as 'Odisch-magnetische Briefe' (1852); 'Der sensitive Mensch und sein Verhalten zum Ode' (1854). *Od*, he said, was a peculiar power possessed by certain persons of special sensitiveness, which enabled them to detect veins of ore, distinguish negative and positive magnetic poles, start a pendulum without touching it and the like. He derived the word from the Latin *vado*, 'I go quickly.' Part of the scientific world attacked his theory, but the larger portion laughed it out of court; and after his death it was quite forgotten. Among his other literary productions may be mentioned 'Geologische Mittheilungen aus Mähren' (1834); 'Das Kreosot' (1833); 'Die Dynamide des Neognetismus' (1840); 'Odische Erweiterungen' (1856); 'Köhlerglaube' and 'Afterwissenschaft,' in reply to Karl Vogt (1856); 'Aphorismen über Sensibilität und Od' (1866); 'Die odische Lohe' (1867).

REICHENBACH, Saxony, 11 miles southwest of and in the circle of Zwickau, 11 miles northeast of Plauen, is a manufacturing town, trading considerably in woolen and cotton goods, and has a notable town hall. This is the home of the distinguished antiquary, Böttiger (q.v.). Pop. (1905) 29,060.

REICHENBERG, rik'hën-bërg, Austria, town in Bohemia, on the Neisse, about 60 miles in direct line north-northeast of Prague (q.v.). It is a well-built town with several modern public buildings and a number of historic edifices dating back to the 13th and 14th centuries. Its principal church contains an altar-piece by

Dürer. It is one of the leading manufacturing towns of Austria. The chief manufactures are woolen, cotton and linen goods, carpets, leather, shoes, hats, gold and silver ware, musical instruments and firearms. The schools rank high, especially its industrial school. Pop. (1914) 37,100.

REICHMANN, rīk'n'mān, **Theodor**, German opera singer: b. Rostock, Mecklenburg, 18 March 1849; d. Vienna, Austria, 22 May 1903. He studied at Berlin, Prague and Milan, and became widely known on the German operatic stage as a dramatic baritone. In 1882 he began his engagement at the Vienna Opera House and in that year created the part of Amfortas in 'Parsifal' at Baireuth. He continued at the Vienna Opera House with great success until 1889, when he came to New York and made his first appearance at the Metropolitan Opera House in 'The Flying Dutchman.' He later appeared in 'Der Trompeter von Salk-Kengen.' His reception there was most flattering, and his success was marked throughout his engagements there in 1889-90, 1890-91. After his New York activities he filled star engagements in London, Saint Petersburg, Moscow and many German cities, and then returned to his former post at Vienna, where he remained till his death. He possessed a remarkable voice; and his dramatic impersonation of his various rôles made him one of the most famous operatic singers of his day. He was notable in his presentation of the rôles William Tell, Telramund, Wolfram, Wotan (in 'Siegfried'), Hans Sachs, Tilos (in 'Der Vassal von Szigeth'), Nelusko (in 'L'Africaine'), etc.

REICHSBANK, *Deutsche*, the official centre of the German banking and monetary system, was inaugurated on 1 Jan. 1876, in accordance with the German Banking Law of 14 March 1875. While established with private means and forming a corporate body, it is under the management and supervision of the empire. Its original capital was 120,000,000 marks, later (7 June 1899) increased to 180,000,000 marks. The purpose of its establishment was the "regulation of the money circulation of the whole Empire, the facilitation of payments, and the utilization of available capital." The management of the institution is vested in the Imperial Chancellor, and by him delegated to the president of the bank and a board of directors, these latter appointed for life. In addition, supervision over the bank is maintained by a board of curators—the Imperial Chancellor and four members. The shareholders have a voice, principally in an advisory capacity through a general meeting, and ad interim through a central committee consisting of 15 members and 15 alternates who meet at least once a month. From this central committee three members are selected to supervise the management of the bank and participate, with advisory powers only, in the meetings of the board of directors. In matters of an unusual nature with the empire or with the German federated states the consent of a majority of the central committee is required. Upward of 500 branches of the Reichsbank are distributed throughout the empire, the shareholders of each community having such a branch, forming district committees similar in function to those of central committee, from which district com-

mittees three deputies are selected to manage the local offices. The Reichsbank is authorized to issue bank notes, in no case more than thrice its cash reserve—coin, bullion, imperial treasury notes and notes of other note-issuing banks—the excess over the cash reserve to be rendered secure by discounted bills secured by at least two persons of known solvency, said excess being subject to a tax of 5 per cent. These bank notes the Reichsbank is obligated to redeem in German gold coin at its central or branch offices on presentation "in so far as the available cash and money requirements permit." Such issues (Act of June 1909) are legal tender. In view of this obligation the activities of the institution are confined necessarily to banking transactions involving assets of immediate marketability; transactions in precious metals; discounting of secured bills of three months or less; purchase and sale of imperial government or federated state bonds, and other like short-term securities specified by law; in addition it receives interest- and non-interest-bearing moneys on deposit and "giro" account; such, if interest-bearing, not to exceed the combined capital and surplus funds of the bank. Finally, it is authorized to receive in custody and manage articles of value. It is the Reichsbank that introduced the system (10 April 1876) of "giro" transactions whereby, in lieu of cash payment between "giro" customers of the bank, the corresponding debit and credit is entered in the accounts of the respective parties, facilitating the settlement of claim and counterclaim at the same bank or between the bank and its branches or between any of the latter by simple bookkeeping transfer. This, of course, presupposes such prior arrangement with the depositors, who are then known as "giro" customers. At the present time a majority of the imperial and federated state government treasuries maintain "giro" accounts with the Reichsbank—a facility employed also by most of the great German corporations, particularly since 1 Jan. 1909, by the introduction of a postal and cheque transfer system to which the Reichsbank is a party. The practical operation of the system is that of an immense clearing-house acting through a single institution. Since its inception the "giro" system has met with every demand of German finance and transactions through it have grown more than twenty-fold.

The condition of the Reichsbank is indicated from the following figures taken from the report for 23 April 1917 (in round numbers): Cash reserve, 3,108,220,000 marks, comprising coin and bullion, to the amount of 2,549,000,000 marks, and treasury and loan bank notes to the amount of 550,420,000 marks; other bank notes 8,800,000 marks; bills discounted, 8,484,800,000 marks; advances, 9,280,000 marks; investments, 105,160,000 marks; other securities, 1,088,000,000 marks; notes in circulation, 8,144,920,000 marks; deposits, 4,014,320,000 marks; other liabilities, 366,240,000 marks; and reserve fund, 83,460,000 marks. The note issue in circulation on this particular date was 8,144,920,000 marks, or 5,036,700,000 marks in excess of the cash reserve. This excess was secured primarily by discounted bills amounting to 8,484,800,000 marks, in addition to the other bank assets amounting to 1,218,984,000 marks, a total of 9,703,784,000 marks, which, minus liabilities c

4,380,570,000, leaves net a balance of 5,323,214,000 marks. The note circulation based upon bills discounted constitutes what is denominated the "elastic" part of the whole note issue, in that it is closely adapted to the varying state of the market, based, as it is, upon the actual evidences of everyday business. What profit undue inflation would give to the bank and its stockholders is counterbalanced by the 5 per cent tax on same that the government receives — a charge that maintains the excess note issue to the actual needs of business.

During its first 35 years of existence (1876-1911) the Reichsbank's net profits amounted in round figures to 691,000,000 marks; during the same period the Imperial Treasury received 325,500,000 marks and the stockholders 336,400,000 marks of these net profits, this being for the latter an annual average of 6.92 per cent. Consult Reisser, J., 'Die deutsche Grossbanken und ihre Konzentration' (1909); 'Germany's Economic Forces' (1913); 'Report on Co-operation in American Export Trade' (Washington 1916).

REICHSRATH, rikhs'rät, the representative council of the empire of Austria. It consists of an Upper House (Herrenhaus), formed of the princes of the imperial family, certain hereditary nobles, archbishops and bishops of princely title, and life-members nominated by the emperor for distinguished service in art, science, the Church and State; and a Lower House (Abgeordnetenhaus), elected on the basis of universal, equal and direct suffrage, under the Electoral Law of 26 Jan. 1907. All Austrian male citizens over 24 years of age who have resided for at least a year in the place of election are entitled to vote for deputies. In 1917 the Upper House contained 237 members and the Lower House 516, the latter elected for six years. See AUSTRIA.

REICHSTADT, rikh'stät, Duke of (NAPOLEON FRANÇOIS CHARLES JOSEPH BONAPARTE), titular emperor of France: b. Paris, 20 March 1811; d. Schönbrunn, Austria, 22 July 1832. He was son of Emperor Napoleon I (q.v.), and from his birth was styled "king of Rome." In 1814 Napoleon abdicated in favor of his son, but the Senate took no notice of the youth and called Louis XVIII to the throne, whereupon Maria Louisa and the boy removed to the palace of Schönbrunn, near Vienna. After Waterloo Napoleon proclaimed his son Napoleon II (22 June 1815). He was brought up at the court of his grandfather, the Emperor Francis, who created him Duke of Reichstadt (1818). His education was careful, and he was early trained to the military profession. At the July Revolution in 1830 his name was mentioned as a candidate for the French throne, and Talleyrand is said to have made an unsuccessful effort in his behalf. After passing through subordinate grades he was made a lieutenant-colonel in June 1831, and took command of a battalion in the Gyulai regiment of Hungarian infantry, then garrisoned at Vienna. He was extremely attentive to his military duties, but he had grown very tall and slender and symptoms of consumption had early shown themselves. His physician advised a removal to Schönbrunn, but this proved unavailing. His last words, addressed to his mother, were "Ich gehe unter, meine Mutter, meine Mutter." The Duke was

made the hero of 'L'Aiglon' ('The Eaglet'), a drama by Edmond Rostand (q.v.). Upon the accession of Napoleon III (q.v.) he was reckoned among French sovereigns as Napoleon II. Consult Welschinger, 'Le Roi de Rome' (1879); Lacroix, 'Le Roi de Rome' (1899); Wertheimer, 'Der Herzog von Rom' (1902).

REICHSTAG, rikhs'täg, the representative legislative body of the German nation as a whole. The Bundesrath is of the separate German states. The president of the Reichstag is elected by the deputies. In 1917 the Reichstag was composed of 397 members, elected by universal suffrage and ballot for the term of five years. See GERMANY.

REICK, rik, William Charles, American journalist and publisher: b. Philadelphia, Pa., 29 Sept. 1864. He was educated at Harvard, and engaged in newspaper work at Philadelphia in 1883. In 1888-89 he edited the London and Paris editions of the New York Herald and in 1889-1903 he was city editor of that publication. He was president of the New York Herald Company in 1903-06, and of the Public Ledger Company of Philadelphia in 1907-12. He was one of the principal owners of the New York Times in 1907-12, and chief owner of the New York Sun in 1911-17.

REID, rēd, Alexander Peter, Canadian physician: b. London, Ontario, 22 Oct. 1836. He was educated at the universities of McGill, Edinburgh and New York. He practised for a time in Ontario, but in 1860 went to the Northwest Territory; returning in 1864 he engaged in practice in Nova Scotia, chiefly at Halifax. He was instrumental in founding the Halifax Medical College and held several chairs there, also serving as president for several years. He was for 16 years visiting physician at the City Hospital, superintendent of the Hospital for Insane for 15 years and later served at the Victoria General Hospital. He was deeply interested in securing legislation governing the study and practice of medicine in Nova Scotia; was secretary of the Provincial Board of Health in 1893-1904, and afterward was chief health officer for Nova Scotia. He was subsequently retired on a pension.

REID, Daniel Gray, American financier: b. Richmond, Ind., 1 Aug. 1858. He was educated in the public schools, entered the Second National Bank of Richmond as a clerk in 1874 and worked his way up to its vice-presidency in 1895. He became interested in the tin-plate industry at Elwood, Ind., in 1892; and in 1895 he was one of the organizers of the American tin-plate industry, of which he was elected president. He removed to Chicago in 1897 and to New York in 1899. He assisted in the organization of the National Steel Company, the American Steel Hoop Company and the American Sheet Steel Company; and on the organization of the United States Steel Corporation in 1901 he became a director and member of the executive committee. He was also interested in railroad organizations and many banks and trust companies.

REID, Sir George, Scottish artist: b. Aberdeen, Scotland, 31 Oct. 1841; d. 9 Feb. 1913. He studied art in Edinburgh, Utrecht, Paris and The Hague, being the pupil in turn of Molinger, Israels and Yvon. In 1891 he was

elected president, in succession to Douglas, of the Royal Scottish Academy and knighted. He was widely known for his fine portraits and was also distinguished as a flower and landscape painter and as a book illustrator of high merit.

REID, George Agnew, Canadian painter: b. near Wingham, Ontario, 1860. At Paris he was a pupil of Constant, Lefebvre and Dagnan-Bouveret and became a constant exhibitor at the Salon. The World's Fair Columbian medal was awarded to his 'The Foreclosure of the Mortgage' (1893). He excels in figure painting and has been successful in panel decoration and the series in the entrance hall of the Municipal Buildings, Toronto, contain very good examples of his style. In 1898 he was president of the Ontario Society of Artists.

REID, Harry Fielding, American geologist: b. Baltimore, Md., 18 May 1859. He was educated at the Pennsylvania Military Academy and at the Johns Hopkins University, later studying in England and Germany in 1884-86. He was connected with the faculty of the Case School of Applied Science, Cleveland, in 1886-94; with the University of Chicago in 1895-96; and in 1896 went to Johns Hopkins, where he has been professor of dynamical geology and geography since 1911. He has been special expert in charge of the earthquake section of the United States Geological Survey since 1902 and in 1917 he was one of the National Research Council sent to Europe by the government to study scientific developments in connection with the European War. Author of 'Parts VI-VIII, Highways of Maryland' (1899); and joint author of 'Second Report on Highways of Maryland' (1902); 'Report of California State Earthquake Investigation Committee, Vol. II' (1910).

REID (Thomas), Mayne, British author of tales of adventure: b. Ballyroney, County Down, Ireland, 4 April 1818; d. near Ross, Herefordshire, England, 22 Oct. 1883. The son of a Presbyterian minister, he was educated for the ministry, but love of adventure took him to this country, where he engaged in various callings and traveled widely as hunter and trader. In 1843 he was a journalist in Philadelphia, but joined the United States army as a volunteer in 1846 and fought in the Mexican War, his experiences in which furnished him with materials utilized in several novels. He afterward went to London and became well known as a writer of thrilling stories, many of them based on his American experiences, such as 'The Rifle Rangers'; 'Scalp Hunters'; 'The War Trail'; 'The Headless Horseman,' etc. He returned to America in 1867 and founded the *Onward Magazine*, which was unsuccessful, and in 1870 went back to England. Many of his tales were translated into French and German. They were all very readable and healthy in tone, though extravagant in incident. Consult 'Memoir' by his wife (1890).

REID, Ogden Mills, American editor and publisher, son of Whitelaw Reid (q.v.) and grandson of Darius Ogden Mills (q.v.): b. New York, 16 May 1882. He was educated at the University of Bonn, Germany, and at Yale, and was admitted to the bar of New York State in 1908. He then began work as a reporter on the New York *Tribune*, occupying dif-

ferent positions in his progress toward managing editorship in 1912 and editorship in 1913. He succeeded his father not only as editor but as principal owner of the *Tribune* and is president of the Tribune Association. His policy in conducting the newspaper has been marked by much vigor and straightforwardness and the gathering of an able staff.

REID, Robert, American painter: b. Stockbridge, Mass., 29 July 1862. His work shows the influence of Impressionism, but as the pupil of Boulanger and Lefebvre in Paris, where he began his art studies, he maintains an academic correctness and insistence upon detail which render his work singularly effective. His great decorative piece in the Paris Exposition of 1900 ('America Unveiling Her Natural Strength') was much admired and like all his productions in this department has extended his reputation. The Library of Congress; Massachusetts State House, Boston; Appellate Court House, New York; Paulist Fathers' Church, New York; and many private buildings contain mural decorations by him.

REID, Sir Robert Gillespie, a Newfoundland railway contractor: b. Coupar-Angus, Scotland, about 1842; d. Montreal, Canada, 3 June 1908. In 1865 he went to Australia, where he took part in gold-mining and public works; in 1871 came to America and constructed many railways in the United States and Canada. The heaviest section of the Canadian Pacific was built by him; and he was prominent also in bridge-work, constructing the international railway bridge over the Rio Grande, the international bridge across the Niagara and (1886) the Lachine bridge over the Saint Lawrence. In 1893 he made a contract with the colony of Newfoundland whereby he was to build a railway from Saint John's to Port-au-Basque to be completed in three years at \$15,600 per mile. For the further consideration of a land-grant of 5,000 acres per mile of construction, he was to maintain and operate the railway for 10 years. He contracted with the colonial government in 1898 to operate all the railways of the island for 50 years, maintaining them in a safe and efficient manner, on condition that the railways should become his property at the end of that period. He was to obtain also 4,500,000 acres of land concessions additional and the government land telegraph lines. On his part he contracted also to build and operate seven steamers transporting passengers and goods at various points in the island; to buy and operate the Saint John's dry-dock; to build and operate an electric street railway in Saint John's; to pave a specified portion of Saint John's; and to pay \$1,000,000 within one year from the date of the signing of the contract. In fact, he became the real owner of the island and was popularly known as "Tsar" Reid. Sir Robert Bond, the Liberal leader, protested against the contract; a material revision of the contract was made favorable to the colony and the property transferred to the Reid-Newfoundland Company. He was knighted in 1907.

REID, Samuel Chester, American naval officer: b. Norwich, Conn., 25 Aug. 1783; d. New York, 28 Jan. 1861. He entered the United States navy as a midshipman when very young, rose rapidly in rank and in the War of

1812 commanded the privateer *General Armstrong*. He repulsed the British attack in the harbor of Fayal, Azore Islands, 26 Sept. 1814, the enemy having three heavily armed vessels with 2,000 men to his single vessel with 90 men and seven guns. During 10 hours' fighting, the British lost 300 killed and wounded and the Americans two killed and seven wounded. The British government subsequently apologized for the attack on an American vessel in a neutral port, and the engagement is considered important in having prevented British ships from attacking New Orleans and so enabling Jackson to reach that city in time to save it. Reid was subsequently harbormaster and warden of the port of New York. He invented a signal telegraph, reorganized the pilot-boat system, established a lightship off Sandy Hook and designed the present flag of the United States, first used in 1818, suggesting the retention of the original 13 stripes and the addition of a star for each new State.

REID, Thomas, Scottish metaphysician: b. Strachan, Kincardineshire, 26 April 1710; d. Glasgow, 7 Oct. 1796. He was graduated at Marischal College, Aberdeen, in 1726, and in 1736 presented to the neighboring living of New Machar. It was his custom to preach the sermons of Tillotson and Evans rather than his own compositions, for he was already chiefly absorbed in the study of metaphysics. In 1748 he published a paper in the London 'Philosophical Transactions,' in which he opposed the introduction of mathematical formulas into metaphysical and moral speculations, and particularly criticized the statement of Hutcheson that the benevolence or moral merit of an agent is "proportional to a fraction having the moment of good for the numerator, and the ability of the agent for the denominator." He was in 1752 elected professor of philosophy in King's College, his department comprehending logic, ethics, mathematics and physics. His 'Inquiry into the Human Mind on the Principles of Common Sense' (1764) aimed at the refutation of Hume skeptical theory. Affirming the impossibility of proving the existence of an external world from reason, or experience, or instruction, or habit, or any other principle hitherto known to philosophers, Reid introduced the doctrine of an original instinct or "common sense" (q.v.) as the ground of the belief. In 1764 he was transferred to the University of Glasgow as successor to Adam Smith in the chair of moral philosophy. His course included metaphysics, moral philosophy, natural law and political right. He was a member of a philosophical society before which he read several essays, including an 'Examination of Dr. Priestley's Opinion Concerning Matter and Mind,' 'Observations on the Utopia of Sir Thomas More' and 'Physiological Reflections on Muscular Motion.' In 1781 he withdrew from public duties to devote himself exclusively to philosophical studies. In 1785 he published 'Essays on the Intellectual Powers of Man,' consisting of his academical lectures, and in 1788 his 'Essays on the Active Powers of Man,' his last important work. An edition of his works with notes and dissertations was prepared by Sir William Hamilton (incomplete, 1846). Consult the 'Life' by Dugald Stewart (1804); McCosh, 'Scottish Philosophy from

Hutcheson to Hamilton' (1890); Sneath, 'The Philosophy of Reid' (1892).

REID, Sir Thomas Wemyss, English journalist: b. Newcastle-on-Tyne, 29 March 1842; d. London, 26 Feb. 1905. He contributed frequently to English reviews and magazines, edited the Leeds *Mercury* (1870-87) and *The Speaker* from 1890 to 1899, when he resigned. He was knighted in 1904. He was the author of 'Cabinet Portraits: Sketches of Leading Statesmen of Both Parties' (1872); 'Charlotte Brontë: A Monograph' (1877); 'The Land of the Bey' (1882); 'Mauleverer's Millions' (1885); and 'Lives' of W. E. Forster (1888), Lord Houghton (1890), Lord Playfair (1899), Gladstone (1899) and William Black (1902). His 'Memoirs,' edited by his brother, were published in 1905.

REID, Whitelaw, American diplomat: b. Xenia, Ohio, 27 Oct. 1837; d. London, England, 15 Dec. 1912. He was graduated from Miami University in 1856; and began his journalistic career as editor of the Xenia *News*, in 1858-59. In 1860 he became a reporter for the Cincinnati *Gazette*, in 1861-62 was war correspondent, and later Washington correspondent for the same paper, the brilliancy and accuracy of his war reports attracting considerable attention among newspaper men. He was aide-de-camp on the staff of General Morris and General Rosecrans in West Virginia. In 1863-66 he was librarian of the House of Representatives and after the war spent some time on a cotton plantation in Concordia Parish, La. In 1868 he joined the editorial staff of the New York *Tribune*; in 1869 became managing editor and in 1872 editor-in-chief. Under his management the *Tribune* came to rank among the leading papers of the city in the trustworthiness of its news reports. He twice declined an appointment as Minister to Germany, was Minister to France in 1889-92 and negotiated important reciprocity treaties, and in 1892 was the unsuccessful Republican candidate for Vice-President. He was the Special Ambassador from the United States to Queen Victoria's jubilee in 1897; was a member of the American-Spanish Peace Commission in Paris in 1898; and was Special Ambassador at the coronation of Edward VII in 1902. In April 1905 he was appointed Ambassador to the Court of Saint James, to succeed Joseph H. Choate, and held that post till his death. He had been a regent of the University of New York since 1878. His notable publications include 'After the War, a Southern Tour' (1867); 'Ohio in the War' (1868), an important contribution to the local history of the State; 'Schools of Journalism' (1870); 'The Scholar in Politics' (1873); 'Newspaper Tendencies' (1874); 'Town Hall Suggestions' (1881); 'Two Speeches at the Queen's Jubilee' (1897); 'Some Consequences of the Late Treaty of Paris' (1899); 'Our New Duties' (1899); 'A Continental Union' (1900); 'Our New Interests' (1900); and 'Problems of Expansion' (1900). He wrote the introduction for the centennial edition of Thackeray's 'Van-ity Fair' in 1908 and was one of the speakers at the English celebration of the centenary of Dickens' birth. In English history, his address on Edmund Burke has been pronounced his most important study.

REID, Sir William, Scottish meteorologist and colonial governor: b. Kinglassie, Fifeshire, 1791; d. London, 21 Oct. 1858. He was educated at the Royal Academy at Woolwich, and in 1809 entered the army as lieutenant of engineers, serving in the Peninsular campaign under Wellington, in America in the War of 1812 and in Belgium in 1815. He was appointed governor of Bermuda in 1839, and by his excellent administration of affairs greatly improved the deplorable agricultural condition of the island. He opened a market for their products in New York and by these and other efficient methods gained the title of "the good governor." In 1846 he became governor of the Windward Islands and in 1848 he returned to England and was appointed commanding engineer at Woolwich. In 1851 he was knighted and appointed governor of Malta, where he remained until 1858. He was raised to the rank of major-general in 1856. He became interested in meteorology in 1831 while superintending the repair of injuries inflicted by a severe hurricane at Barbados, and engaged in a correspondence with William C. Redfield (q.v.) of Yale College. The correspondence has since been presented to Yale. His publications include 'An Attempt to Develop the Law of Storms by Means of Facts Arranged According to Place and Time' (1838) and 'The Progress of the Development of the Law of Storms' (1849).

REID, William Thomas, American educator: b. near Jacksonville, Ill., 8 Nov. 1843. He served in the Union army during the Civil War, was graduated from Harvard in 1868 and was headmaster of the high school, Newport, R. I., 1868-71. He subsequently taught in the Boston Latin School, was superintendent of the Brookline, Mass., schools 1873-75, was principal of the San Francisco Boys' High School 1875-81 and president of the University of California 1881-85. He founded the Belmont School for Boys at Belmont, Cal., the most important college preparatory school on the Pacific Coast and was for many years its headmaster. Consult Adams, 'Some Famous American Schools' (1903).

REIDSVILLE, N. C., city in Rockingham County, 75 miles northeast of Raleigh, on the Southern Railway. It is situated in a tobacco-raising district and has tobacco factories and warehouses as well as a cotton-mill. Pop. 4,828.

REIGHARD, rī'gārd, Jacob Ellsworth, American zoologist: b. Laporte, Ind., 2 July 1861. He was graduated in 1882 from the University of Michigan; studied also at Freiburg-im-Breisgau, was assistant professor of zoology at the University of Michigan in 1887-88 and 1890-92, and directed the scientific work of the Michigan fish commission in 1890-95. In 1898-1901 he was in charge of the biological survey of the Great Lakes for the United States Fish Commission. From 1895 he held the chair of zoology in the University of Michigan. He wrote 'The Anatomy of the Cat' (with H. S. Jennings, 1901) and many papers on freshwater biology and sub-aquatic photography.

REIGN OF TERROR, a period of the French Revolution, conspicuous for its horrors and cruelties. It is generally considered to extend from 21 Jan. 1793, the date of the execu-

tion of Louis XVI, to 28 July 1794, when Robespierre and other sanguinary leaders were guillotined. Every day, during the Reign of Terror, victims were hurried, after a mock trial, to the scaffold, and the prisons were kept replenished by fresh captives from all parts of France. When all the nobility who could be reached had been cut off, the middle and lower classes were drawn upon for victims, and the terrorists even laid traps for each other, in their mad ambition and fear of what the future might bring. At last a successful *coup d'état* was secretly organized, which resulted in the extermination of the more rabid revolutionists and the lifting of the awful nightmare which had brooded for months over France. The Reign of Terror had its reaction in the despotism of Napoleon and eventually in the restoration of the Bourbons.

REIKIAVIK, rī'kē-ā-vīk, or REYKJAVIK, rī'kyā'vīk (Dan. *Reikjavík*), Iceland, capital of the island, stands on the southwestern coast and is an important northern port from which considerable trade is carried on. It is the seat of a local legislature and, under the constitutional law of 1903, of a minister appointed by the Danish king. It is also the seat of a bishop. The climate is not very severe as generally supposed. The people are unusually intelligent; the chief institutions include a public library, college, gymnasium, observatory, churches and medical, divinity and nautical schools. A noteworthy attraction is a statue of Thorvaldsen. A great fair is held annually

REIMARUS, rī-mā'roos, Hermann Samuel, German scholar: b. Hamburg, 22 Dec. 1694; d. there, 1 March 1768. Early in life he devoted himself to the study of languages, and he became distinguished for his knowledge of Latin, Greek and Hebrew. From about 1714 he studied at Jena and afterward lectured at Wittenberg. He became in 1723 rector at Wismar and in 1728 was appointed to the professorship of Hebrew in the Gymnasium of Hamburg, which he subsequently united with the professorship of mathematics. He edited the works and wrote the life of his father-in-law, 'De Vita et Scriptis J. Alb. Fabrici Commentarius' (1737). The edition of Dio Cassius, begun by Fabricius and ended by him, shows him as a philologist in a favorable light. Among his further publications are 'Die vornehmsten Wahrheiten der natürlichen Religion' (1754); 'Betrachtungen über die Kunsttriebe der Thiere' (1762), and 'Vernunftlehre' (1756). In the 'Wolfenbüttelsche Fragmenten eines Ungenannten' (published by Lessing in 1777-78) he made an application of the rules laid down in the last-mentioned work against the positive doctrines of Christianity. Until published by Lessing it was known only in manuscript to a few of his most intimate friends. It precipitated the well-known controversy between Lessing and Pastor Goeze of Hamburg. Toward the end of his life Reimar applied his hours of leisure to the study of natural history, of which he acquired an extensive knowledge and led to his 'Observations, Physical and Moral, on the Instinct of Animals' (2 vols., 1760. See LESSING).

REIMS, rēmz. See RHEIMS.

REINACH, rā-nāk, Joseph, French publicist and politician: b. Paris, 30 Sept. 1856. He studied law at the University and was admitted to the bar in 1877, in 1881 became secretary to Gambetta and continued such until the fall of that minister. Having earlier devoted considerable time to journalism, he returned to that field in 1886, becoming proprietor with Denayrouse of *La République Française*. In 1889 he was elected deputy by the arrondissement of Digne and was re-elected in 1893, but owing to his attitude of criticism of the Dreyfus trial and his demand for a revision, he failed of re-election in 1898. He published a number of pamphlets on this celebrated case. He is also the author of 'La Servie et la Monténégro' (1876); 'Voyage en Orient' (1879); 'Le Ministère Gambetta, Histoire et Doctrine' (1884); 'Etudes de Littérature et d'Histoire' (1888-89); 'La Politique Opportuniste' (1890); 'Petites Catilinaires' (1888-89), being his articles against Boulangism published in *Republique Française*. He edited 'Discours et Plaidoyers politiques de Gambetta' (1881-85) and 'Dépêches Circulaires Décrets, Proclamations et Discours de Gambetta' (1870-71).

REINACH, Salomon, French archaeologist, brother of Joseph Reinach (q.v.): b. Saint-Germain-en-Laye, 21 April 1858. He was educated at the Lycée Fontanes and the École Normale Supérieure and was appointed to the École Française d'Athènes. He made a series of excavations and investigations at Myrina near Smyrna in 1880-82, was secretary of the Archaeological Commission of Tunis in 1882-85 and in 1886 was an attaché at the Museum of National Antiquities at Saint-Germain-en-Laye. In 1890-92 he was assistant professor of archaeology at the École du Louvre, was associate curator of the National Museums in 1893, in 1896 was elected to the Académie des Inscriptions et Belles-Lettres and in 1906 became president of that institution. He has published 'Chronique d'Orient' (1885-91); 'Description raisonnée du Musée de Saint-Germain' (1890); 'Répertoire de la Statuaire grecque et romaine' (1897-98); 'Guide illustré du Musée national de Saint-Germain' (1899), etc. A bibliography of his works, embracing more than 50 volumes and about 2,000 articles, has been printed, last edition 1907. His most popular works are a general history of art and a general history of religion.

REINBOLD, rin'bôlt, Adelheid. See BERTHOLD, FRANZ.

REINDEER, a very distinct genus *Rangifer*, of *Cervidae*, unique in the possession of antlers by both sexes, though those of the female are somewhat smaller. The Euro-Asiatic reindeer (*Rangifer tarandus*) is the only domesticated species of the family. It extends over the boreal regions of the Eastern hemisphere between about lat. 50° and 81°, and runs into several well-marked varieties. The reindeer formerly had a much wider geographical range and is probably the *bos cervi figura* described by Cæsar as inhabiting the Hercynian forests. Its remains are found associated with hippopotami in Pleistocene formations still farther south in Europe. The antlers are not alike on both sides, the great palmated brow tine being, as a rule, developed on one side only. In the winter the fur is long, grayish

brown on the body; neck, hind-quarters and belly white. In summer the gray hair darkens into a sooty brown and the white parts become gray, owing to the shedding of the long hairs. To the Laplander the reindeer serves as a substitute for the horse, the cow, the sheep and the goat. It is extensively employed as a beast of draft and carriage, being broken to draw sledges or to carry men or packages on its back; the large race of Siberia and Kamchatka being used especially for the latter purpose. A full-grown animal can draw a weight of 300 pounds and travel at the rate of 100 miles a day, its broad deeply cleft hoofs fitting it admirably for traveling over the broken snow. In winter the herds feed in the woods on the lichens which hang from the trees or grow upon the ground, to secure which the shovel-like brow tine and the hoofs are employed to scrape away the snow; in summer they move to the valleys to feed on the herbage and shoots, and in autumn they seek the sea coast in order to escape the mosquitoes and gad-flies, where they feed largely upon marine algae cast upon the shore. So important are these animals to the Laplanders that they, with their entire households, accompany them on these annual migrations. In 1891 16 head of domestic reindeer were introduced into Alaska by Dr. Sheldon Jackson for the benefit of the natives who frequently suffered for food and for purposes of transportation. The experiment proved so satisfactory that importations were continued for 10 years, at the end of which time 1,200 had been brought from Siberia. In 1898 Dr. Jackson, as agent of the United States government, procured a colony of Laplanders to train the natives in the care of the reindeer. On 30 June 1915 there was officially reported a total of 70,243 reindeers in the Territory, distributed among 76 herds. Of the total 46,683 were owned by natives; 3,408 by the United States government; 6,890 by the various missions, and 13,262 by Laplanders and other whites. The valuation of the reindeers owned by natives was \$1,167,075; of those owned by all others, \$589,000; the total income of natives from their holdings, 1895-1915, was \$369,407, of all others, \$107,361; making the total valuation and income \$2,232,843, and the total government appropriation for the industry in 1893-1915 was \$307,000; total gain, \$1,925,843.

By European mammalogists the American wild reindeer or caribou, as they are called, are considered to be co-specific with *R. tarandus*, but American students recognize two native species with some six or seven sub-species. The woodland caribou (*R. caribou*) inhabits the wooded parts of British America and the United States border from Maine to Minnesota. It is larger than most varieties of the European reindeer, and both the brow and bez tines of the antlers are much palmated; those of the female are much smaller and little palmated. It frequents marshy regions and feeds upon leaves, grass and shoots, but in some localities at least, migrates northward in the winter in search of tree lichens (*Usnea*, etc.) and reindeer moss (*Cladonia rangiferina*). The latter is a valuable lichen, which grows in great abundance in the north of Europe, particularly in Lapland, as well as on the tundras of Siberia and the barren plains of Arctic America. It constitutes almost the sole winter food of the rein-

deer. Linnæus says it grows so luxuriously in Lapland that it sometimes reaches a foot in height. The reindeers scratch it up from under the snow with their feet and antlers. On this plant their existence, as well as that of the Laplanders, to whom they are indispensable, depends. Its nutritive properties depend chiefly on the gelatinous and starchy matter of which it is largely composed. Its taste is slightly pungent and acrid. When boiled it forms a jelly possessing nutritive and tonic properties.

The Barren Ground caribou (*R. arcticus*) is a smaller species with larger antlers which occupies the more central and northern barren plains of British America. This species lives in herds of enormous size, said to rival even those of the bison of former days and migrates regularly. In the winter it moves southward to the wooded belt where it meets but does not mix with the woodland caribou, and in the spring returns to the shores of the Arctic Ocean. See CARIBOU.

Much interesting information concerning the habits of reindeer will be found in the narratives of Nordenskjöld and other Arctic travelers. Besides these consult Caton, 'Antelope and Deer of North America' (Boston 1881); Lydekker, 'Deer of All Lands' (London 1898); Richardson, 'Fauna Boreali-Americana' (London 1829); Jackson, 'Annual Reports on Reindeer in Alaska' (Bureau of Education, Washington 1892), and annual reports of the Secretary of the Interior and the governor of Alaska.

REINDEER MOSS. See REINDEER.

REINECKE, rī'nĕk-ĕ, Karl, German musician: b. Altona, Prussia, 23 June 1824; d. —, March 1910. He was educated by his father, a composer, and in 1834 made a successful concert tour as a pianist, later becoming court pianist to the king of Denmark. He was appointed a teacher in the Cologne Conservatory in 1851 and in 1860 was made professor of piano and composition in the Leipzig Conservatory. He became well known as a director and as a pianist and for his interpretations of Mozart. His compositions number nearly 200, are characterized by great refinement and have a distinctly classical and occasionally a romantic touch. They include 'Serenade'; 'Aus der Jugendzeit'; 'König Manfred' (1867); 'Auf hohen Befehl' (1886); 'Der Gouverneur von Tours' (1891), etc.

REINHART, rīn'härt, Benjamin Franklin, American artist: b. Waynesburg, Pa., 29 Aug. 1829; d. Philadelphia, 3 May 1885. At 15 he began to study art, and afterward took a three years' course at the National Academy, New York. In 1850 he went to Europe and studied in Paris and Düsseldorf. Returning to this country, he settled in New York in 1868. His most important works are engravings, and include 'Cleopatra' (1865); 'Washington Receiving the News of Arnold's Treason'; 'After the Crucifixion' (1875); 'Evangeline' and 'Pocahontas' (1877); 'The Pride of the Village'; and 'Captain Kidd and the Governor' and 'Baby Mine' (1884); 'The Nymphs of the Wood'; 'Katrina Van Tassel'; 'Young Franklin and Sir William Keith'; 'The Regatta'; 'Consolation,' etc. To these should be added portraits of the Princess of Wales, Duchess of Newcastle, Carlyle, Tennyson, Charles O'Connor,

James Buchanan, General Winfield Scott, Stephen A. Douglas and others.

REINHART, Charles Stanley, American artist, nephew of Benjamin Franklin Reinhart: b. Pittsburgh, 16 May 1844; d. Philadelphia, 30 Aug. 1896. He went to Paris in 1868 and studied at the Atelier Suisse; later entered the Royal Academy in Munich; and in 1870 returned to the United States. Besides noteworthy illustrations for magazines in this country and in Europe, he produced works in black-and-white, water-color and oil, many of which were exhibited at the National Academy. In 1881 he again went to Paris where he resided till 1891, and was a regular exhibitor at the Salon. Later he became a member of the Society of American Artists, New York, and was identified for several years with the publishing house of Harper and Brothers. Among his works in black-and-white are 'An American Abroad,' 'A Little Swiss Sojourn' and 'Reichstag Sketches'; in water-color, 'Gathering Wood' (1877); 'At the Ferry' (1878), and 'The Spanish Barber' (1884); in oil, 'The Old Life-Boat' (1880); 'Washed Ashore' (1887); and 'The Rising Tide' (1888). He also produced a series of Civil War scenes, several of which were published in *Harper's Weekly* in double-page form. Among his earlier paintings should be noted 'Clearing Up' (1875); 'Reconnoitering' (1876), and 'Refuse' (1877).

REINHART, Johann Christian, German painter: b. near Hof, 24 Jan. 1761; d. Rome, 8 June 1847. He began his professional education as a divinity student in Leipzig theological school, but soon showed a very decided inclination for art and became a pupil of Oeser. He afterward attended the Academy of Dresden. The liberality of his patron, the Margrave of Baireuth, enabled him to visit Rome, where he fixed his residence. His compositions are richly conceived and full of poetic beauties, but his coloring is wanting in softness and warmth. Of the great masters he most strongly resembles Swanevelt. Among the most excellent paintings of his later years are those in the Massimiliani Palace at Rome. He was also successful as an etcher. Consult Baisch, 'J. Ch. Reinhart und seine Kreise' (1882).

REINHOLD, rīn'hölt, Karl Leonard, German philosopher: b. Vienna, 26 Oct. 1758; d. Kiel, 10 April 1823. His parents destined him for the church, and sent him to study with the Jesuits in Vienna. When the order was abolished in 1774 he entered the college of the regular priests of Saint Paul (generally called Barnabites), where he became, at 22, professor of philosophy. He left Austria in 1787, and the same year was appointed professor at Jena, having written a celebrated vindication of the Reformation against two chapters in Schmidt's 'History of the Germans.' In 1794 he became professor at Kiel and remained there until his death. Among his other works are 'Über das Fundament des philosophischen Wissens' (1791); 'Grundlegung einer Synonymik für den allgemeinen Sprachgebrauch in den philosophischen Wissenschaften' (1812). In his philosophy he followed Kant, Fichte, Baile and Jacobi. Consult 'Life' by his son E. Reinhold (1828); Fischer, Kuno, 'Die neuere Philosophie seit Kant'; 'Nouvelle Biographie Générale.'

REINICK, rī'nīk, Robert, German artist and poet: b. Dantzic, Prussia, 22 Feb. 1805; d. Dresden, 7 Feb. 1852. He studied painting in Berlin under Begas, and at the Düsseldorf Academy, and in 1844 settled at Dresden. He displayed superior artistic powers in romantic and historical subjects, and especially in such works as show the artistic union of brush and pen. Among his more important productions in art are 'Rachel and Jacob at the Well'; 'Well Near Olevano,' and numerous etchings contributed to various publications. To Retzel's 'Dance of Death' he furnished the poetical text and his other writings include 'Song-book for Artists' (1833); 'Song-book of a Painter' (1837-44); 'Songs and Fables for the Young' (1844); Hebel's 'Allemanic Poems' (1851), which he translated into High German; 'Collected Songs' (1852); and 'Book of Poetic Fables and Stories' (1873).

REINICKÉ, rī'nīk-ě, Paul René, German painter and designer: b. Strenz-Naundorf, near Halle, 1860. Beginning his professional life at Weimar in the studio of A. Struys, he afterward became a pupil of E. von Gebhardt at Düsseldorf. In order to extend still further his art experience he went to Palestine as a pupil and assistant of Piglhein, at that time painting his panorama of the 'Crucifixion of Christ,' and executed a considerable portion of that work. While his promise as a painter was very evident he abandoned the easel on returning to Munich and became chief illustrator for the 'Fliegende Blätter.' The wonderful skill he has shown in this department of art is well known and he has depicted aristocratic life in park and promenade, ballroom and theatre, with a truthfulness and grace, with a suggestive wealth of detail and consummate finish of execution which are unrivaled. A collection of his designs, under the title 'Spiegelbilder aus dem Leben' ('Reflections from Life') has appeared in heliogravure (1890).

REINKENS, rin'kēns, Joseph Hubert, German Old Catholic bishop: b. Burtscheid, near Aix-la-Chapelle, Germany, 1 March 1821; d. Bonn, 5 Jan. 1896. He was educated at Bonn and Munich, was ordained to the Roman Catholic priesthood in 1847, became a preacher in the cathedral, extraordinary professor (1853), ordinary professor of church history (1857), and rector of the University of Breslau (1865). In 1870 he joined Döllinger in the Old Catholic movement, protested against the infallibility dogma, was suspended from his clerical offices and in 1872 was excommunicated. He became one of the leaders of the Old Catholic movement and in 1873 was consecrated bishop of the Old Catholic Church with his official residence at Bonn, and was recognized as such by the German government. He published 'Papst und Papstthum nach der Zeichnung des Neiligen Bernhard von Clairvaux'; 'Hilarius von Poitiers' (1864); 'Ueber papstliche Unfehlbarkeit' (1870), which his bishop attempted to suppress; 'Die päpstlichen Decrete vom 18 Juli 1870' (1871); 'Revolution und Kirche' (1876); 'Lessing über Toleranz' (1883), etc.

REINSCH, rīnch, Paul Samuel, American historian, educator and diplomat: b. Milwaukee, Wis., 10 June 1869. He was graduated from the University of Wisconsin in 1892, from its law

department in 1894, and after studying abroad was assistant professor of political science at the University of Wisconsin in 1899-1901, full professor in 1901-13, and in the latter year was appointed United States Minister to China. He is the author of 'The Common Law in the Early American Colonies' (1899); 'World Politics at the End of the 19th Century as Influenced by the Oriental Situation' (1900); 'Colonial Government' (1902); 'Colonial Administration' (1905); 'American Legislatures and Legislative Methods' (1907); 'Intellectual Currents in the Far East' and 'International Unions' (1911), etc.

REIS EFFENDI. See EFFENDI.

REISEBILDER, rī'zē-bīl'dér. The 'Pictures of Travel' belong to the first period of Heine's literary career and made him famous as a writer of prose. The first volume (1826) and the second (1827) are partly in prose and partly in verse, while the third (1830) and fourth (1831) contain prose only. Heine incorporated the poems which occur in the 'Pictures of Travel' (Vol. I, 'The Return Home,' 'From the Journey to the Harz' and the first section of 'The Northsea'; Vol. II, the second section of 'The Northsea') into the 'Book of Songs.' The 'Letters from Berlin' (prose) which appeared in the first edition of the 'Pictures of Travel' (Vol. II) were omitted in subsequent editions. Heine drew directly on his personal experiences for all the 'Pictures of Travel,' and at times his genius lights up his subjects with the brilliance of lightning, at times we feel more as a passing breath of wind the spirit and the atmosphere of times and places. On the other hand, the author's own personality, his political views and various accessory circumstances of his travels stand out altogether too prominently to permit of comprehensive and objective visions of the regions he visited. Heine never confines himself to his subject, but speaks—as he himself said—"of everything and a few things besides," mingling with perfect ease the brilliant and the disgusting, the touching and the malicious, the humorous and the sentimental, the grand and the trivial. Irony and love of liberty are two qualities which especially manifest themselves. Among the features and topics which mark the various parts of the 'Pictures of Travel' apart from the poems are: the charm of the mountains and the simplicity of their inhabitants ('The Journey to the Harz' in Vol. I); Norderney as a lonely island given up to tradition and as a modern summer resort ('The Northsea,' section 3 in Vol. II); Heine's boyhood days and his admiration for Napoleon I ('Ideas. The Book Le Grand,' in Vol. II); German and Italian cities, ancient Rome and modern Italy ('Journey from Munich to Genoa' in Vol. III); characters drawn in a cynical and satirical vein, polemics against the poet Platen ('The Baths of Lucca' in Vol. III); celebration of a Catholic holiday in an old Italian city, religious controversies ('The City of Lucca' in Vol. IV); London, political life in England ('English Fragments' in Vol. IV). Consult Elster, E., 'Heinrich Heines Sämtliche Werke' (Leipzig 1890, Vol. III and Vol. I, pp. 35-89, text and introductions); Strodtmann, A., 'Heinrich

Heines *Leben und Werke* (3 Aufl., Berlin 1884); Bölsche, W., 'Heinrich Heine, Versuch einer ästhetisch-kritischen Analyse seiner Werke' (Leipzig 1888); English translation: 'The Works of Heinrich Heine,' tr. by C. G. Leland (Vols. II, III); selections (in 'German Classics,' Vol. VI).

EWALD EISERHARDT.

REISKE, ris'kē, **Johann Jakob**, German philologist: b. Zörbig, Saxony, 25 Dec. 1716; d. Leipzig, 14 Aug. 1774. He was educated at the University of Leipzig and devoted much attention to the study of the Semitic languages, particularly Arabic. Although abjectly poor he journeyed to Leyden, where he gained access to the library and continued his study of Arabic. In 1758 he was appointed to a rectorship at the Nikolai Gymnasium at Leipzig, a position he occupied until his death, devoting himself to Greek literature in regard to which he became an authority. His works display a wide erudition and he succeeded in attracting public attention to the value of Arabic literature in the world of learning. He edited 'Constantius Porphyrogenetus' (1751-54); 'Ciceronis Tusculanae Quaestiones' (1759); 'Theocritus' (1765-66); 'Maximus Tyrius' and 'Oratores Graeci' (1774-75); 'Dionysius Zalicaruasensis' (6 vols., 1774-77); 'Plutarchi Opera Omnia' (12 vols., 1774-82), etc.; translated from the Arabic and Greek classics and made the Latin translation of Abulfeda's 'Annales Moslemici' (1754). Most important among his writings are 'Miscellaneæ aliquot Observationes Medicæ ex arabum Monumentis' (1746), and 'Animadversiones in Græcos Auctores' (6 vols., 1757-66). Consult 'Autobiography,' edited and completed by his wife (1783); Morus, 'Vita Reiskii' (1777); Haupt, 'Opuscula' (1875-76).

REISNER, George Andrew, American Egyptologist: b. Indianapolis, Ind., 5 Nov. 1867. He was graduated at Harvard in 1889, afterward pursuing graduate courses in Semitic languages there. He was assistant in the department of Egyptology at the Royal Museum, Berlin, in 1895-96, and instructor at Harvard in 1896-97. In 1897-99 he was a member of the international committee on catalogues at the Khedivial Institute, Cairo, and in 1905 became connected with the faculty at Harvard, where he has been professor of Egyptology since 1914. He was appointed curator of the Egyptian department of the Boston Museum of Fine Arts in 1910. He served as director of the Egyptian expeditions of Harvard and of the Boston Museum of Fine Arts from 1905, and has engaged in explorations and excavations in Nubia, Samaria, Bersheh, Girda-Pyramid, Lower Nubia and Dongola. He was granted leave of absence from Harvard in 1916-17. He has written 'The Early Dynastic Cemeteries of Nuyu-ed-der' (Part I, 1907); 'First Annual Report, Nubian Archaeological Survey' (1910); 'Models of Ships and Boats' (1913), etc.

REITBOKS, or **REEDBUCKS**, a genus (*Cervicapra*) of small South African antelopes, which have horns only on the heads of the males and are never found far from water, affecting particularly marshy valleys and the reedy borders of the larger rivers. They are rather more than four feet in length and nearly

three feet high at the shoulder; general color, dull ashy-gray, sometimes tinged with red on upper parts, silvery-gray on under parts. The type is *C. arundinum*. Other species are the rio rhebok, nagor and bohor.

RÉJANE, rā-zhān, **Madame**, stage-name of GABRIELLE (RÉJU) POREL, French actress: b. Paris, 6 June 1857. She first appeared in 1875 in 'Revue des Deux Mondes' at the Vaudeville. She became known for her impersonation in melodramatic parts, particularly in the title-rôle of 'Madame Sans Gêne' (1893), written for her by Sardou. In 1895 she toured in the United States with much success. One of her later appearances was in 'La Passerelle' at the Vaudeville. In 1905 she founded a theatre in Paris bearing her own name.

REJECTED ADDRESSES, a famous collection of parodies by the brothers James and Horace Smith, which was issued anonymously in 1812, and met with great success. They were written as a burlesque upon the many prominent and unsuccessful competitors for the reward offered by the management of the Drury Lane for an address to be delivered at the opening of the new theatre. Among the parodies the following are the work of James Smith: 'The Baby's Début' (Wordsworth); 'The Hampshire Farmer's Address' (Cobbett); 'The Rebuilding' (Southey); 'Play-House Musings' (Coleridge); 'The Theatre' (Crabbe); the first stanza of 'Cui Bono' (Lord Byron); the song entitled 'Drury Lane Hustings'; and 'The Theatrical Alarm-Bell,' an imitation of the editor of the *Morning Post*; also travesties on 'Macbeth,' 'George Barnwell' and 'The Stranger.' The rest are by Horace Smith. The 'Rejected Addresses' still hold a high place among the best works of their kind ever written, and their extent and variety exhibit the versatility of the authors. James Smith (1775-1839) and Horace Smith (1780-1849) were voluminous contributors to the periodical literature of the day, largely in humorous imitations and amusing trifles. The elder Charles Mathews said to James: "You are the only man in London who can write what I want, good nonsense."

REJUVENATION, the revival of stream erosion in a region in which the rivers have cut as low as they can. It is usually brought about by uplift.

RELAPSING FEVER, a disease so called from the fact that during apparent convalescence a relapse of all the symptoms occurs; and this may be repeated more than once. It is also called famine fever, because it has occurred during seasons of destitution since 1739. Other names for it are five-day fever, seven-day fever, mild yellow fever, heart fever and *febris recurrens*. Its present name was given to it by Jenner in 1850. It is infectious and contagious. The symptoms do not usually show themselves for three or four days after exposure to the contagion. They generally begin in a shivering sensation, with headache, and with muscular pains all over the body, but especially in the limbs; then the pulse rises and the temperature increases; there is also great thirst, pain over the stomach and retching. Sometimes there is intense hunger and the patient becomes en-

tremely prostrated. On the fifth or seventh day the symptoms abate and there is rapid amendment until about the 14th or 15th day from the beginning of the symptoms, when a relapse occurs. Three or four days afterward convalescence again begins and in the majority of cases it goes on to complete restoration of health. Relapsing fever is not often fatal, the death rate being about 2 per cent of those attacked. The treatment consists in giving gentle laxatives and cooling drinks, a light nutritious diet and in securing to the patient perfect quietness. Relapsing fever is now known to be caused by a spirillum (*Spirochaeta obermeieri*), a micro-organism which Obermeier of Berlin showed (1873) to be constantly present in the blood of those having this disease.

RELATIVITY, The Principle of. The principle of relativity consists essentially in the hypothesis that it is impossible by physical experiment to measure or detect the absolute motion of a body through space. As a consequence the expressions "absolute velocity" and "body at rest" have no significance. Only relative motion can be detected or even defined. If this were all the subject would be of interest to the philosopher rather than the physicist. But it can be shown as a consequence that space and time have no absolute significance. They depend on the motion of the observer. As stated by Minkowski, "From now on, space by itself and time by itself, are mere shadows, and only a kind of blend of the two exists in its own right."

Absolute Motion.—It has been known for a long time that the dynamical properties of a system in uniform motion are identical with those of the same system at rest. A person shut in a box moving with constant velocity could not determine by mechanical means whether he was moving or not. Certain optical experiments, however, suggested that optical methods might determine absolute motion. Thus the index of refraction of a piece of glass is the ratio of the velocity of the incident light to that of the refracted light. Arago, in 1818, suggested that this might be used to determine absolute velocity. The experiment did not succeed. Fresnel explained this by supposing the light to be partially convected, or dragged, by the moving medium. Fizeau tested this notion by sending a beam of light along the direction of motion through water flowing in a tube and found that the velocity of light in the moving water was slightly different from that in water at rest. The experiment, however, only indicated the difference in velocity of the water in two tubes and not the absolute velocity.

The most famous experiment for detecting absolute motion was devised by A. A. Michelson in 1881, repeated with greater refinement by E. W. Morley in 1887, and again repeated with greater care by E. W. Morley and D. B. Miller in 1905. It is generally called the "Michelson-Morley Experiment."

The fundamental idea is as follows: A beam of light from a source S is divided by partial reflection at a plate of glass A into two portions traveling along the paths AM_1 and AM_2 . These portions are reflected back by mirrors at M_1 , M_2 , and, on striking the plate again, a part of the beam from M_1 is trans-

mitted and a part of that from M_2 is reflected, the two being brought to interference at C .

Suppose the whole apparatus moving with velocity v in the direction AM_2 . Let c be the velocity of light. As the light goes from A to M_2 , its velocity relative to the apparatus is $c-v$, while on the return journey it is $c+v$. The time to pass from A to M_2 and back again is then

$$\frac{l_2}{c-v} + \frac{l_2}{c+v} = \frac{2l_2}{c^2 - v^2}.$$

Since the apparatus moves the distance v while light moves the distance c , the beam passing from A to M and back describes a path ABA' in space. By similar triangles

$$AB = \frac{ch}{(c^2 - v^2)^{\frac{1}{2}}} = BA'.$$

The time required to describe the path ABA' is then

$$\frac{AB}{c} + \frac{BA'}{c} = \frac{2l_1}{(c^2 - v^2)^{\frac{1}{2}}}.$$

The retardation in time of the former beam relative to the latter when they are brought together again is

$$2 \left\{ \frac{l_2}{c^2 - v^2} - \frac{l_1}{(c^2 - v^2)^{\frac{1}{2}}} \right\}. \quad (1)$$

If now the whole apparatus is rotated 90 degrees so that AM_1 is in the direction of motion, l_1 and l_2 change places and the retardation becomes

$$2 \left\{ \frac{l_1}{(c^2 - v^2)^{\frac{1}{2}}} - \frac{l_2}{c^2 - v^2} \right\}.$$

The change in retardation is

$$2(l_1 + l_2) \left\{ \frac{c}{c^2 - v^2} - \frac{1}{(c^2 - v^2)^{\frac{1}{2}}} \right\}.$$

This should result in a displacement of the

interference fringes when the apparatus is rotated. No such displacement was found, though the effect due to a velocity one-tenth that of the earth in its orbit could have been detected in the experiment of Morley and Miller.

Fitzgerald and Lorentz independently suggested that motion might cause a change of length in the direction of motion. If all lengths in the direction of motion are decreased in the ratio

$$\left(1 - \frac{v^2}{c^2}\right)^{\frac{1}{2}},$$

(1) becomes

$$2\left\{\frac{l_1}{(c^2 - v^2)^{\frac{1}{2}}} - \frac{l_1}{(c^2 - v^2)^{\frac{1}{2}}}\right\}$$

and after rotation through 90 degrees the retardation has the same value. Hence the null effect in the Michelson-Morley experiment is explained.

If we accept this explanation the difficulty is only moved one step farther. While we could compare lengths of objects moving with known velocities it would be impossible to determine the absolute distance of points in space. For the only way we can measure distances is by means of material scales. If such scales are subject to the Fitzgerald contraction, scales moving with different velocities give different values for the distance between the same points of space. Since no means has been found for determining which scales are moving and which are not, there appears to be no way of determining, and so defining the distance between two points.

Similar difficulties are encountered when we try to determine simultaneous instants of time at different points. The ordinary way of transferring time from a point A to a point B is by moving a clock from the one point to the other. If the clock is subject to the Fitzgerald contraction, however, its parts will change length when in motion. This may change the period of vibration, and so the time determined at B will depend on the speed which the clock is moved and the path along which it is moved from A to B . Any other mechanism (velocity of chemical action, for example), may be similarly affected. If we attempt to transfer time by means of light or electromagnetic signals, since the absolute distance between points is unknown, we cannot determine the interval required for the signal to pass from A to B and, even if the distance were known, the time of passage would seem to depend on the absolute velocities of A and B .

Einstein's Relativity of Time and Space.

—In 1905 A. Einstein took up the question as to what might properly be understood by time and space. He assumed a system of points at rest with respect to each other and with respect to a system of co-ordinate axes. This means merely that an observer attached to the system and measuring distances with a scale finds no evidence of motion. He further assumes a system of clocks attached to the points on which time can be measured. It is necessary first to synchronize the clocks, i.e., determine simultaneous instants of time at the different points. To do this a ray of light starts from a point A , goes to a point B , and is there reflected back to A . Let t_a, t_a' be the times on

the A -clock when it starts and when it returns, and t_b the time on the B -clock when it is reflected. If

$$t_a - t_a = t_a' - t_b, \quad (2)$$

the clocks at A and B are said to be synchronous. This definition merely expresses that the time required for light to go from A to B equals the time required to return. This is a case of the principle of relativity. For if a means of measuring time existed such that the absolute motion of the system made these intervals different, it could be used to detect absolute motion.

In referring to the time of an event it is always understood that the time is measured on the clock at the point where the event occurs.

Let S' be a second set of points at rest with respect to each other but appearing to the inhabitants of S to move with velocity V . The same events may be observed by the inhabitants of S and S' , each measuring time with his own clocks and distance with his own meter stick. Einstein's first fundamental problem was to determine the relation between the distances and times thus obtained. To do this he made two assumptions which are generally called the first and second postulates of relativity.

I. *The Principle of Relativity.*—The laws of physical phenomena are the same whether stated in terms of one system of co-ordinates or another moving with constant velocity with respect to it.

II. *The Principle of Constant Light-Velocity.*—The velocity of light is a constant independent of its source and of the system with respect to which it is measured.

The principle of relativity as here stated is equivalent to the impossibility of defining absolute motion. For, if there were any law that differed at different velocities of the reference system, that law could be used to distinguish such differences of absolute velocity, and, conversely, such differences could only be detected by observing some phenomenon which changed with the velocity.

That the velocity of light is independent of the observer is a special case of the principle of relativity. That it is independent of the source is a physical assumption for which there is considerable independent evidence. For example, if the velocity of light changed with the velocity of the source, the total change in the time of passage of light from some of the fixed stars would be so great that the star would be seen in two different points of its orbit at the same time.

Let OX, OY, OZ be a system of rectangular axes in S , the X -axis pointing in the direction of motion. Let $O'X', O'Y', O'Z'$ be a similar set of axes in S' , the two origins coinciding when

$$t = t' = 0$$

Let t be the time and x, y, z , the co-ordinates of a point when the inhabitants of S see an event occur. Let t' be the time and x', y', z' the co-ordinates of the point where the inhabitants of S' locate the same event. We shall now determine the equations connecting x, y, z, t and x', y', z', t' .

These equations must be linear. For a free particle appears to both observers to move in a straight line with constant velocity. Hence a first degree equation should transform into a first degree equation. Since each particle of

S' moves parallel to OX with velocity V , the equations have the form

$$\begin{aligned}x' &= a_1(x-vt) + a_{1y} + a_{1z}, \\y' &= b_1(x-vt) + b_{1y} + b_{1z}, \\z' &= c_1(x-vt) + c_{1y} + c_{1z}, \\t' &= d_1x + d_{1y} + d_{1z} + d_{1t}.\end{aligned}$$

The first three equations show that the points $y=0$ lie in a fixed plane of S' . Similarly, the points $z=0$ lie in a fixed plane of S' . These may be taken as the planes $y'=0$ and $z'=0$, respectively. By symmetry these planes in S' will be perpendicular, for there is no reason why one of the angles they determine should be greater than the other. In the same way, the points $x-vt=k$, when k is constant, lie in a fixed plane of S' perpendicular to $O'X'$. Hence the equations reduce to the form

$$\left. \begin{aligned}x' &= \beta(x-vt), y' = ly, z' = mz, \\t' &= d_1x + d_{1y} + d_{1z} + d_{1t}.\end{aligned} \right\} \quad (3)$$

A particle starting from the origin at $t=0$ and moving with respect to S with the velocity c of light has co-ordinates satisfying the equation

$$x^2 + y^2 + z^2 = c^2 t^2. \quad (4)$$

By Einstein's second postulate, the same particle moves with velocity c with respect to S' . Hence (4) must have as consequence

$$x'^2 + y'^2 + z'^2 = c^2 t'^2.$$

By substituting the values from (3) and comparing with (4) we get

$$\begin{aligned}\beta^2 v &= -c^2 d_1 d_{1y}, d_1 d_{1z} = 0, \\ \beta^2 &= m^2 = \beta^2 - c^2 d_{1y}^2 = \frac{1}{c^2} [c^2 d_{1y}^2 - \beta^2 v^2].\end{aligned}$$

Solving these equations and substituting in (3), we get

$$x' = \beta(x-vt), y' = ly, z' = lz, t' = \beta \left(t - \frac{vx}{c^2} \right), \quad (5)$$

where

$$\beta = \frac{1}{1 - \frac{v^2}{c^2}}$$

Solving for x, y, z, t , we get

$$\begin{aligned}x &= \beta(x' + vt'), y = \frac{1}{l} y', z = \frac{1}{l} z', \\ t &= \beta \left(t' + \frac{vx'}{c^2} \right).\end{aligned} \quad (6)$$

If these are to have the same form as (5), except for the change in the sign of βv , we must have

$$l = 1.$$

Hence, finally,

$$x' = \beta(x-vt), y' = y, z' = z, t' = \beta \left(t - \frac{vx}{c^2} \right). \quad (7)$$

These are known as the Lorentz transformations because Lorentz first obtained similar formulas in his work on electromagnetic theory.

Consequences of Einstein's Theory.—The equations

$$y' = y, z' = z,$$

show that distances in a moving system perpendicular to the direction of motion are the same whether measured by an observer moving with the system or one at rest.

Let x_1', x_2' be the co-ordinates of two fixed points in S' in a line parallel to the direction of motion. Then

$$x_1' = \beta(x_1 - vt), x_2' = \beta(x_2 - vt).$$

The distance between these points appears to the observer in S to be

$$x_2 - x_1 = \frac{1}{\beta} (x_2' - x_1') = \sqrt{1 - \frac{v^2}{c^2}} (x_2' - x_1').$$

A body moving with velocity v thus appears to an observer at rest to be reduced in the direction of motion in the ratio

$$\sqrt{1 - \frac{v^2}{c^2}}.$$

A sphere in motion appears to an observer at rest to be an ellipsoid. This is the Fitzgerald contraction used to explain the Michelson-Morley experiment.

From (7) we get

$$t = \beta \left(t' + \frac{vx'}{c^2} \right).$$

If t_1' and t_2' are measured at the same point of S'

$$t_1 = \beta \left(t_1' + \frac{vx_1'}{c^2} \right), t_2 = \beta \left(t_2' + \frac{vx_2'}{c^2} \right),$$

whence

$$t_2' - t_1' = \frac{1}{\beta} (t_2 - t_1) = \sqrt{1 - \frac{v^2}{c^2}} (t_2 - t_1).$$

Intervals of time on a moving clock are thus less than the corresponding intervals indicated

by fixed clocks in the ratio $\sqrt{1 - \frac{v^2}{c^2}}$: 1. This

is independent of the direction of motion. If then the particle moves around a closed path and returns to its starting point, the time elapsed will be less on the moving clock than on fixed ones. In particular, if the clock moves with the velocity of light, $v=c$ and $t_2'=t_1'$. In a system moving with the velocity of light, time is thus constant.

Differentiating (7), we get

$$\frac{dx'}{dt'} = \frac{dx'}{dt} \frac{dt}{dt'} = \frac{\frac{dx}{dt} - v}{1 - \frac{v}{c^2} \frac{dx}{dt}}.$$

Similarly,

$$\frac{dy'}{dt'} = \frac{\frac{dy}{dt}}{1 - \frac{v}{c^2} \frac{dx}{dt}}, \quad \frac{dz'}{dt'} = \frac{\frac{dz}{dt}}{1 - \frac{v}{c^2} \frac{dx}{dt}}.$$

If then the velocity of a particle has components u_x, u_y, u_z with respect to S and u_x', u_y', u_z' with respect to S' ,

$$u_x' = \frac{u_x - v}{1 - \frac{vu_x}{c^2}}, u_y' = \frac{u_y}{1 - \frac{vu_x}{c^2}}, u_z' = \frac{u_z}{1 - \frac{vu_x}{c^2}}. \quad (8)$$

These formulas give the result of subtracting a velocity with components $v, 0, 0$ from one with components u_x, u_y, u_z . The result is not obtained as in ordinary mechanics by merely subtracting corresponding components.

In relativity mechanics the mass of a particle is not constant but depends on its velocity. The mass is determined by assuming that the mutual actions of a system of particles do not change the total momentum with respect to a given system. Suppose m_0 is the mass of a ball at rest and m its mass when moving with velocity v . Take two identical balls, one attached to a system S , considered at rest, the

other attached to a system S' moving with velocity v . Through a collision of the two balls, let the one in S' be deflected with velocity u along the y' -axis. Its velocity parallel to the y -axis in S will be

$$\frac{u}{\beta}$$

Also, by the principal of relativity the ball in S will have the velocity $-u$ along the y -axis. Since neither ball had any velocity along that axis before collision, the conservation of momentum requires

$$\frac{mu}{\beta} - m_0 u = 0,$$

whence

$$m = \beta m_0 = \frac{m_0}{\sqrt{1 - \frac{v^2}{c^2}}} \quad (9)$$

The force acting on a particle is defined as the rate of change of momentum

$$F = \frac{d}{dt}(mv),$$

where m is the mass and v the velocity, all quantities being measured by the same observer. The work done by this force in moving the particle a distance ds is

$$Fds = \frac{ds}{dt} d(mv) = v d(mv).$$

Using the above value of m , this reduces to

$$Fds = c^2 dm.$$

The result is the increase in the kinetic energy of the particle. Hence the increase in kinetic energy is equal to the increase in its mass multiplied by the square of the velocity of light. If now the body comes to rest, this increase in mass will be transmitted to other bodies as energy. It is then reasonable to assume that mass and energy are merely different aspects of the same entity. In ergs of energy, one gram of mass is equivalent to

$$c^2 = (3 \times 10^{10})^2 = 9 \times 10^{20},$$

approximately.

Similarly, an amount of energy E has the mass

$$\frac{E}{c^2} \quad (10)$$

This means that energy has inertia just like ordinary mass.

Mass and energy cannot be treated separately. If we make a division of the total into material mass M and energy E , the laws of conservation of mass and energy in an isolated system are expressed by the equivalent equations

$$M + \frac{1}{c^2} E = \text{const.}, \quad E + c^2 M = \text{const.}$$

Four-Dimensional Geometry of Minkowski.—An event occurs at a point x, y, z and at a time t . Minkowski considered the four variables as the co-ordinates of a point in a space of four dimensions. The motion of a particle is represented by a line in that space. In his first paper Minkowski used as co-ordinate along the time axis $ct\sqrt{-1}$. In a later paper of Minkowski and in most of the papers of more recent writers the co-ordinate along that axis is ct . The four co-ordinates are then

$$x_1 = x, \quad x_2 = y, \quad x_3 = z, \quad x_4 = ct,$$

The Lorentz transformations appear as the changes of variable from one set of co-ordinate axes in the four-dimensional space to another. The values of x, y, z, ct obtained by observers moving with different velocities are merely the co-ordinates of the same point in four dimensions referred to different axes.

The principle of relativity requires that when stated in this four-dimensional form, physical laws must be independent of the axes used. That is, the laws of physics must be expressible by equations invariant in the space of Minkowski.

Take two points x_1, y_1, z_1, ct_1 and x_2, y_2, z_2, ct_2 in the four-dimensional space. The quantity

$$s = \sqrt{c^2(t_2 - t_1)^2 - (x_2 - x_1)^2 - (y_2 - y_1)^2 - (z_2 - z_1)^2}$$

may be considered as a sort of distance between the points. By applying the Lorentz transformations it is easily shown to be independent of the reference system. In particular, if the two points represent consecutive positions of a moving particle

$$ds = \sqrt{c^2 dt^2 - dx^2 - dy^2 - dz^2} = c dt \sqrt{1 - \frac{u^2}{c^2}},$$

where u is the ordinary velocity of the particle.

The various positions of a moving particle are represented by a curve in the four-dimensional space. Any kinematical property of the motion is represented by a geometrical property of the curve. If r is the vector from a fixed origin to any point of the curve,

$$w = \frac{dr}{ds}$$

is a vector of unit length tangent to the curve at that point. If m_0 is the rest mass of the particle $m_0 w$ is called its extended momentum. It can be written

$$m_0 w = \frac{mu}{c} + mk_4,$$

where u is the vector representing ordinary velocity and k_4 is a unit vector along the time axis. Since mu is the momentum of the particle and m its energy or mass, the laws of conservation of momentum and of mass or energy of an isolated system are all expressed by the one equation

$$\Sigma m_0 w = \text{const.}$$

In all the interactions of a system of particles, the total extended momentum is thus constant.

To give any adequate conception of the form in which Minkowski represented the equations of electromagnetic theory, it would be necessary to use a considerable amount of four-dimensional vector-analysis. It is sufficient to say that there exists a four-dimensional two-vector (analogous to a directed section of a plane) M resolvable into a sum of two parts

$$M = H + E,$$

where H lies in the three-dimensional space and E passes through the time axis. The magnetic intensity is a vector in the observer's space perpendicular to H and the electric intensity a vector along the line in which E intersects that space. The various values of magnetic and electric intensity as seen by observers moving with different velocities are obtained by referring this same two-vector M to different sets of four-dimensional co-ordinate axes.

To an observer moving with a given velocity,

spatial forms can be represented in three dimensions. To an observer moving with a slightly different velocity, there appears a slightly different space. Since the practicable range of velocity is so small, we can to a high degree of approximation consider these spaces the same. If we could experience all velocities up to that of light, the ensemble of all such spaces would be the four-dimensional space of Minkowski. If the principle of relativity is correct, this four-dimensional universe has as great reality as the three-dimensional one consciousness presents to us, but as yet our experiences have been limited to only a thin section of it.

H. B. PHILLIPS,
Professor of Mathematics, Massachusetts Institute of Technology, Cambridge, Mass.

RELAY. See ELECTRICAL TERMS.

RELEASE, in law, is the name given to a common-law conveyance, in which the word "release" is the operative verb. A release operates in five modes: (1) By passing an estate, as when a joint-tenant or coparcener conveys his estate to his cojoint-tenant or coparcener; (2) by transferring a right, as when a disseizee (a person who has been unlawfully dispossessed) discharges his right to the disseizor; (3) by extinguishment, as the lord releasing his seignorial rights to his tenant; (4) by enlarging a particular estate into an estate commensurate with that of the person releasing; (5) by entry and feoffment, as a disseizee releasing to one of two disseizors, which is equivalent to entry on the property and enfeoffment after putting an end to the disseizin. Blackstone says (*Commentaries*, book II and chap. 20): "Releases are a discharge or conveyance of a man's right in lands or tenements to another that hath some former estate in possession." In simple language a release is the discharge of a right, by an instrument in writing, by which estates, rights, titles, entries, actions and other things are extinguished and discharged; and, in general, the term signifies a person's surrender of the right or action he has, or claims to have, against another or his lands.

RELIANCE. An American yacht. See YACHTS AND YACHTING.

RELICS, the mortal remains of departed saints; also, objects associated in memory with them, such as articles they used in life—clothes, vestments, the pectoral cross or the pastoral staff of a holy bishop, or the like: similar reminders of the life and death of Jesus Christ are also relics; and the religious veneration of all such relics when they are duly authenticated is expressly approved by the Catholic Church. The Council of Trent in Sec. xxv of its Acts and Decrees regarding invocation of saints condemns those who hold that "veneration and honor is not due to relics of saints"; but all the Protestant churches teach that veneration of relics, or relic worship, is a sin of the nature of idolatry. In favor of the Catholic doctrine is cited the teaching of the early Fathers, who find both in the Hebrew Scriptures and in the New Testament the highest sanction for the veneration of relics, for example, the incident of the coming to life again of a corpse on contact with the bones of the prophet Eliseus (Elisha: 2 Kings xiii, 21);

and that recounted in Acts xix, 12 (compare v, 15), of sick persons being healed with "handkerchiefs or aprons" that had touched the living body of Saint Paul: "there is a power," says Saint Cyril of Jerusalem (*Catecheses* xviii) "latent even in the bodies of the just." And the practice of the faithful in the first ages of the Church is fully consonant with this belief in the physical and spiritual efficacy of relics. The early Christians were careful to save the remains of martyrs from desecration. In the year 107 the bones of Saint Ignatius, bishop of Antioch, were gathered and wrapped in fine linen, to be guarded thereafter "as a priceless treasure left to the Holy Church." In the year 167 the faithful of Smyrna exhumed the remains of their bishop, Saint Polycarp, who had been burned alive 10 years before under Marcus Aurelius and treasured them as "more precious than costly stones and more valuable than gold." When Saint Cyprian, bishop of Carthage, was about to be decapitated (258 A.D.), the Christians cast towels and napkins before him that they might be soaked in his blood. After the persecutions were over, the practice of veneration of sacred relics persisted in the Church, as is testified by the writings of Saint Ambrose, Saint Augustine, Saint Jerome and indeed by all the Fathers of the 4th and 5th centuries. In all ages there have been abuses connected with the practice. A canon of the Fourth Council of Lateran in the year 1215 forbade relics to be sold or to be exposed outside of their cases or shrines and prohibited the veneration of new relics till their authenticity had been approved by the Pope: and these laws are confirmed in decrees of the Council of Trent. The veneration of relics has attained its maximum in the Roman Church and there, according to Addis and Arnold (*Catholic Dictionary*), these articles comprise the "bodies, or fragments of the bodies of departed Saints: articles, or portions of articles, which they have used; the holy nails, lance, spear, or fragments of the True Cross; and the girdle, veil, etc., of the Blessed Virgin." In the Roman Breviary there are special offices for the Most Holy Relics (to be said on the fourth or last Sunday in October), for the Crown of Thorns, the Lance and Nails, etc.

RELIEF, in old English law, a fine or composition paid by the heir of a tenant, holding by knight's service or other tenure, to the lord on the death of the ancestor for the privilege of succeeding to the estate, which by strict feudal law had lapsed or fallen to the lord on the death of the tenant.

In physical geography, the undulations or surface elevations of a country.

In painting, the appearance of projection and solidity in represented objects, so as to cause them to appear precisely as they are found in nature.

In sculpture and architecture, the prominence of a figure from the plane surface to which it is attached; according to the degree of prominence, it is known as alto-relievo or high relief, mezzo- or demi-relief and bas- or low-relief.

In ordinary language, release from a post or duty by a substitute, who may act either permanently or temporarily; specifically, the release of a sentry from his post, which is taken by another soldier, also the person who thus relieves or takes the place of another.

RELIEF SCULPTURE. See **SCULPTURE**

RELIGIO MEDICI was the first of Sir Thomas Browne's books and has always been the one most generally read. It was first printed in an unauthorized edition in 1642, followed in the next year by an edition under Browne's own supervision. The book was the fruit of much reading and much quiet observation and reflection, but is not Browne's most characteristic work. Enthusiasts are more likely to turn to his 'Pseudodoxia Epidemica or Enquiries into very many received Tenets and commonly presumed Truths' (1646) or to his 'Hydriotaphia, Urneburiall' (1658) as giving with fullest body the peculiar flavor of Browne's somewhat whimsical personality and as exemplifying that sombre magnificence of style in rhythm and phrasing, not unworthy to be compared with Milton's at their best, which is the special virtue of Browne's most admirable prose. The preference of the general reader for 'Religio Medici' is largely due to its theme and to Browne's highly characteristic attitude toward this theme. The religion of a physician, to translate Browne's title literally, is an arresting topic. It is always interesting when a man who has been deeply concerned with the facts of the natural world abandons himself to speculation on the supernatural possibilities of human existence. Browne's interest in this subject is almost purely speculative. He lived in an age of controversy and at a time when dogmatic opinion flourished, but he acknowledged himself unsuited to follow the controversial method and unable to condemn categorically opinions which he could not share. If one sought for it, so he thought, one would find some good in everything. His habit of mind was to steer a middle course between credulity and scepticism, with a strong leaning toward the latter. But nobody so charitable toward strange views as the sceptic turned loose in the field of speculation, and in reading Browne, one is continually being caught up by his defense of such opinions as the belief in witchcraft, by his apparent desire to put faith in the existence of "changelings" (though he will not go so far as to say that a man can be "despecciated" into a horse), or by his occasional defense of ecclesiastical practices which in his day the normal Protestant (and Browne asserted that the only thing he disliked about Protestantism was the name) would never have thought of defending. In short, Browne loved to sport in paradox and intellectual hyperbole, habits of mind often annoying to the literal-minded reader. Beneath these eccentricities, however, there lay a solid foundation of character and belief, an open-mindedness and readiness to see the best in everything, which make of him a better proponent of his views than an orthodox dogmatist, or a bitter iconoclast could have been.

GEORGE PHILIP KRAFF.

RELIGION has been variously defined according to a multitude of epistemological and ethical systems. The pantheist Hegel takes it to be "the knowledge acquired by the finite spirit of its essence as Absolute Spirit." Kant makes duty to follow his categorical imperative of the practical reason; and religion to be "the recognition of all our duties as divine commands." Huxley defines religion as "rev-

erence and love for the ethical ideal, and the desire to realise that ideal in life." According to Max Müller, religion is "the perception of the infinite." Schleiermacher says, it is "a determination of man's feeling of absolute dependence." Matthew Arnold, the apostle of sweetness and light, finds that religion is "morality touched by emotion." The latest definition is that of Reinach, 'Orpheus' (1909): "Religion is a collection of scruples that are a stumbling-block to the free exercise of our faculties."

Waiving these definitions, based upon false philosophical systems, one may begin by conceiving a man's religion as his Godwardness. Cicero, 'De Natura Deorum,' II, xxviii, derives *religio* from *re-legere*, to re-collect, to recall to mind, to reflect. Lactantius, 'Institutiones Divinae,' IV, xxviii, throws over this derivation, and traces *religio* back to *re-ligare*, to bind again. This etymology is commonly accepted. Man is bound to God as creature to Creator; by religion he renews this bond, whenever in word or deed he acknowledges a dependence upon God. Religion, then, in its essence, is generically a practical acknowledgment of man's dependence upon a Supreme Power that is beyond control. This article will treat: first, revealed religion as it is accepted by those who believe in the supernatural revelation of God to man; second, natural religion, as it is found among those who admit not that supernatural revelation.

I. Revealed Religion.—They who believe in God's revelation of Himself to the human race as the basis of religion do not deny that man's acknowledgment of dependence upon God is postulated by the very nature of the universe; to this form of natural religion they superadd the obligation of worship consequent upon revelation. "What is known of God is clear" even to the heathen. For, "ever since the creation of the world, the unseen truths about God,—His everlasting power and divinity,—are to be reasoned out and seen by His works" (Romans i, 19-20). And yet "God, who of old, at many times and in many places, spoke to our ancestors by the prophets, hath in these latter days spoken to us by a Son" (Hebrews i:1-2). This communication of truth by God to the human race through the prophets and the Son is the basic fact of revealed religion.

1. Possibility of Revelation.—Subjective idealists and Kantians deny the possibility of revelation; for, in their systems of philosophy, knowledge has no objective validity, and there can be no certainty that God speaks to man. The adherents to revealed religion believe in a Personal Deity, Creator of man. Since this Creator has bestowed upon man the faculty of communicating his ideas with fellow-men, He undoubtedly may in like manner communicate with us. The deist errs in assigning to God such transcendence as to preclude the possibility of revelation. For the infinity of God includes omnipresence; and His omnipotence demands that He may communicate with His creature wherever He is. Such communication is not opposed to the divine wisdom. For the authority of God revealing gives to man greater certainty of religious and moral truth than does the authority of reason unaided by revelation. Moreover, fallen human nature, tainted by original sin, has tendencies to evil

that are consequent upon concupiscence. God, in His wisdom, meets this fallen condition by the manifold graces of revealed religion. Nor has human reason any such Kantian autonomy as to preclude the possibility of God's revelation to man. For the soul that reasons is created by God. But God is a Person, and every person acts with a purpose. Therefore, God created the reasoning soul with a purpose. But in this divine purpose, God may intend a supernatural end, and may reveal this end to man; and man's reason has no right to reject the revelation. Hence neither the wisdom of God nor the Kantian autonomy of reason precludes the possibility of supernatural revelation to the human race.

2. Knowability of Revelation.—Granted the possibility of revelation, how can man be certain of the fact that God has spoken? Time-honored criteria are given, by which one may be at least morally certain that in revealed religion God has entrusted truths of faith and morals to the human race. These criteria are miracles, prophecies fulfilled, the heavenliness both of the truth communicated and of the effects of that communication in the souls of men. No prudent man has any right to deny that a code of faith and morals is revealed religion, if that code does not contradict right reason, instills the practice of virtue even in an heroic degree, effects lives of virtue among men in every clime and down through many centuries, has been given to the world by one who claimed to have received it from God and made good his claim by miracles and by true prophecies, and has been handed down to the world by a never-failing body of teachers instituted by the founder as a part of his revealed religion.

3. Fact of Revelation.—The Old Testament is clear witness to the fact of God's communication with the human race. Such communication is frankly admitted, and logically defended, by those who accept this collection of sacred books as God's own word. The Old Testament is an history of the human race from its inception, and of God's revelation of Himself to that race. This history is not chronology nor critical work, but fact-narrative in primitive and popular form. It begins as a primitive tradition, and gradually approaches nearer and nearer to the form of popular history. Herein are taught the beginnings of revealed religion by God's messages to Adam; the evolution thereof by the Messianic prophecies to Abraham, Isaac and Jacob; the still further development of true religion by frequent revelations to Moses; the carrying on of these revelations through the prophets of Israel and Judah. Herein also the miracles of the Exodus, and the theocratic rule of Jahweh over the flock of his pasture are clearly attested. One has to deny the divine authority of these books, if one admit not the fact of revelation in the Old Law.

The New Testament is replete with just such proofs of God's revelation to the human race in His Son.

First, Jesus made claim to a divine ambassador. According to the witness of John alone, the claim was made 32 times. This divine ambassador again and again insisted; "My teaching is not mine, but His who sent me" (John vii, 16); "As the Father hath sent me, so I send you" (John xx, 21).

Secondly, Jesus appealed to His Future resurrection in proof of the truth of His claim, that He was the ambassador of God the Father, and that He had from God the Father a message for the world. Witness the sign of Jonas: "Just as Jonas was in the belly of the sea-monster three days and three nights, so shall the Son of Man be in the earth three days and three nights" (Matthew xii, 39-41). Witness the sign of the Temple: "Destroy this temple, and in three days I will raise it up" . . . He was speaking of the temple of His body" (John ii, 18-22). Witness the repeated and detailed prophecy of the oncoming death and resurrection of Jesus: "He shall be delivered to the Gentiles; and shall be mocked, and scourged, and spat upon. And after they shall have scourged Him, they shall kill Him. And the third day He shall rise again." This prophecy is given three times by Mark (viii, 31; ix, 11-13 and 30; x, 33-34), three times by Matthew (xvi, 21; xvii, 12 and 22-23; xx, 18-19), and twice by Luke (ix, 22; xviii, 31-34). There can be no doubt about the fact. Jesus clearly appealed to His future resurrection in proof of the truth of His claim that He had from the Father a message for the world.

Thirdly, Jesus arose from the dead to fulfil His prophecy in proof of the truth of His claim to the divine ambassadorship, to the message from the Father, to the right to give that message to the world. This clear fact is denied only by those who start by throwing out of court miracles, prophecies and all the supernatural elements of religion.

Lastly, Jesus consigned to a teaching body the very same message which He had from God the Father, and conveyed to that teaching body the right to have and to hold and to hand down that message to the world. 1. Just before His ascension, He appeared to the 11 apostles in Galilee and said to them: "All power hath been given me in heaven and upon earth. Therefore go ye, make disciples of all nations, baptise them in the name of the Father and of the Son and of the Holy Ghost, teach them to observe all things whatsoever I have commanded you. And, lo, I am with you all days, even to the end of the world" (Matthew xxviii, 18-20). 2. On the very point of ascending into heaven from Mount Olivet, Jesus once again gave this solemn message to the same body of teachers: "Go ye to all the world, preach the Gospel to all creation. He that believeth and is baptised, shall be saved. He that believeth not, shall be damned" (Mark xvi, 15-16).

Such is a brief outline of the possibility, knowability and fact of revelation,—the all-important elements of revealed religion of the Old Testament and the New.

Bibliography.—Ottiger, 'Theologia Fundamental' (1897); De Broglie, 'Religion et Critique' (1906); Hettinger, 'Revealed Religion,' Eng. trans. (1895); Drum, 'Divinity of Christ' (1918); Schmidt, 'La révélation primitive' (1914).

II. Natural Religion.—Under this heading will be treated religion as it is found in the history of peoples who have not accepted the Bible, the inspired Word of God to the human race. These various forms of religious belief are all degenerations from primitive revelation. In some is found the pantheistic tendency of

identifying subject and object; most are theistic in separating the worshipper from the object worshipped. These theistic cults are at times monotheistic, though generally polytheistic. Monotheism is the worship of one Supreme Power. Polytheism is the worship of many gods. In polytheistic religions, the Supreme Power is found to have degenerated into an obscure form, which faintly preserves the unity and supremacy of the All Father of monotheism. Sometimes the relic of the Supreme Power of primitive revelation may be marked in what Max Müller calls *henotheism*, the singling out of a particular god for a seemingly monotheistic reverence. By such henotheistic praises, Sumerian hymns extol Marduk and Sin with the attributes usually assigned to various other deities. A second obscure form of the Supreme Power is the chief of the gods, the *Prytanis* or president of the assembly of immortals, as Zeus in Homeric theogony; or, again, the dimmed Power called Fate, which in Greek classic tragedy controls both gods and men. Finally the Supreme Power, in the Upanishads of India, has been vaporized into an all-pervading, pantheistic Spirit. Modern pantheism has evolved this all-pervading Spirit into a completely evaporated, ethereal and generally impersonal Being,—the Absolute, which is all that is, and apart from which is naught that is.

Rationalistic historians of religion assume that all these various forms of monotheism, henotheism, polytheism, pantheism, are an evolution of the consciousness or emotion of man that has been due to sociological or other environment. They deny that the Personal Deity has revealed Himself to man; scout the very idea that all forms of pagan cults are mere degenerations from primitive revelation; and try to explain as purely natural the worship of a Supreme Power which must be admitted to be universal, be it never so obscured and vaporized.

1. *Theories of the Origin of Religion.*—The chief theories, whereby rationalists strive to explain the empirical fact of an universal cult of a Supreme Power, are animism, totemism and magic. These theories all start from a false assumption. It is assumed that the present state of civilization and religion has resulted from evolution. Primitive man was a brutish cave dweller; and from a neolithic state he has been evolved into that of culture. The religion of cultured man is in like manner an evolution from primitive forms. Hence the lower its civilization the nearer is a race to primitive religion. One must study religion as it is in savage peoples in order to come near to the primitive religion of mankind. All this is groundless assumption and progressive assertion. Fiction is proposed as fact; emphasis takes the place of logical reasoning.

The Biblical narrative of the creation of man with at least a normal intellectual equipment, and of the descent of the human race from the created pair, is the only authoritative witness we have about primitive man, and stands the test of all argument based upon whatsoever facts the spade has upturned and literature has preserved. There is absolutely no proof that a prehistoric, neolithic man ever existed. The Neanderthal man and other abnormalities of such sort have turned out to be nothing more

than mere degenerations. Profane history takes us back about 7,000 years, and no farther. Bible history takes us back farther, even to the beginning of the race, but not in the form of chronology. Early traditions, as handed down by Genesis, are not chronological history; but only a popular narrative of the story of man and of God's revelation of Himself to man. How long intervened between the creation of man and the beginning of profane history we have no idea. Thousands of years may be allowed for the evolution of the linguistic, sociological and ethnological differences that separated the races at the time profane history begins. The process of this evolution is enwrapped in mystery. We can only argue from the facts to hand.

Chinese pictographs of the dynasty of Shang, second millenium a.c., show the Mongolian characteristics of to-day,—almond-shaped eyes, almost beardless faces and straight hair; while contemporaneous Egyptian hieroglyphic writing is evidence of the modern Western facial traits. A horizontal straight line may be drawn through the eyes that serve as ideographic signs in the West; whereas, in the Far East, such a line is broken into an angle. The inscriptions and carvings on Egyptian temples show that, during the reign of Rameses II, before the Exodus, c. a.c. 1250, the negro, the Semite, the Hittite and the Egyptian were types as ethnologically separated from each other as the Iranian, Semitic and African types are distinct to-day. It is only guess-work to conjecture how long it took to evolve these characteristics which distinguished the races ethnologically in the dim past.

Linguistics throws no more light upon the history of primitive man than does ethnology. So far back as language can be traced, no hint appears of the undoubtedly common original tongue spoken by men. In Mesopotamia, as early as a.c. 4500, the Sumerians spoke a language as much removed from that of their Babylonian conquerors as Hungarian diverges from modern Arabic. The word *hand* in Sumerian was *kam*, and the same root is found in Hungarian *kase* as well as in kindred words of the Lapps and the Finns. Compare with this Sumerian *kam* its contemporaneous Babylonian equivalent *idm*; follow this Semitic root for 7,000 years through Assyrian *idu* and *iadu*, Hebrew *jad*, Aramaic *jada*, Syriac *ida*, Arabi *jad*. The history of these two dissimilar roots both meaning *hand*, is evidence of the linguistic evolution of peoples, but leaves us in utter darkness about the language of primitive man. Here is another linguistic fact that the present write has discovered. The Gros Ventres say *if* for woman, and *enenya* for man. It is strange that the science of language has not yet called attention to the Semitic origin of these forms. Compare the following Semitic words for *man*: Hebrew, *ishsha*; Aramaic, *itta*; Syria *attetha*; Assyrian, *ishshatu*; and for *woman*: Hebrew, *enosh*; Aramaic, *enash*; Syriac, *enash*; Assyrian, *nishu*. There must have been Semitic influence in the history of the Gros Ventre. When? During the reign of Tai-tsong, A. 627-649, when Nestorian missionaries introduced Christianity into Mongolia from Persia. Or thousands of years before the Christian era? We know not. This much we know, that the science of linguistics, which cannot explain modern facts of diversity and similarity of lan-

gauge, is helpless to solve the problem of the primitive civilization of the human race.

As comparative ethnology and linguistics fail to reach back to the primitive racial characteristics and language of man, so comparative history of religions can prove only two facts about man's primitive beliefs: 1, that no people has been found to be without some cult of a Supreme Power, into a relation of dependence upon which the individual members entered; 2, that the manifold and multiform evolution of natural religion is due to a degeneration from the unity of revelation. It is a false start to assume that the savages of Africa, America and Australia are nearer to primitive religion than are cultured races. There is no reason to think that, for thousands of years, savages have been linguistically, sociologically and theistically at a standstill; and that they bring us back to primitive conditions wherefrom our more civilized races are evolved. Human nature abhors such a standstill; it either progresses or degenerates, and that most of all in its practice of religious worship. Sometimes this degeneration is in both culture and religion; at other times it is in religion alone. Instances of degeneration in both culture and religion may be found in out of the way places of the United States. The "Pinies" of the neighborhood of Mount Holly, N. J., are said to belong racially to the same stock as the colonial element of Philadelphia; and yet, because of inbreeding and isolation, they have degenerated to the mentality of children and have lost hold of some of the fundamental principles of morality. Instances of degeneration from revealed religion alongside of advance in culture are provided by Leuba, 'The Belief in God and Immortality' (1916). His figures show that, among the "greater men of science" of the United States, belief in a Personal Deity,—that is, worship of a Supreme Personal Power,—is had by only 34 per cent of the physicians, 16 per cent of the biologists, 32 per cent of the historians, 19 per cent of the sociologists and 13 per cent of the psychologists. It were just as reasonable to study the religious ideas of these cultured atheists, as to examine into the taboos of savage peoples, in the effort to reach back to the origin of religion in the human race.

2. Animism.—What has been said in the preceding section applies in general to the rationalistic theories on the origin of natural religion. The three chief theories of to-day will now be more specifically set forth. Animism is the name given by E. B. Tylor, 'Primitive Culture' (1903), to the faith of primitive man. His theory is pretty much the same as the "Ghost Theory" of Herbert Spencer, 'Principles of Sociology' (1882); it finds the origin of religion in the tendency to endow material objects with living souls, reason, will and the passions. Just as the child whips a door for naughtily jamming its finger, so primitive man took inanimate things as possessed by souls. It is not clear that the child is not taught to vent its hurt feelings thus foolishly; nor does history prove that the prehistoric savage, whom nobody ever saw, had a child's mental equipment. Still Mr. Tylor is not proving anything. He is theorizing by the process of progressive assertion. We proceed. Primitive man speculated on the differences between a living body

and a dead one, a man asleep and awake, the human forms seen in time of waking and of dreaming. He concluded that man had a "ghost soul," which left him in sleep for a time and in death forever; and that this "ghost soul" appeared to others in their dreams. The ingenious, prehistorical psychologist then speculated on his shadow. It followed him everywhere; was an inseparable companion in hours of consciousness, a very self and yet another self; and thus came to be thought of as an immortal shade. To this "apparitional soul," which could take a vacation from the body for a time or forever, physical powers were in due season assigned. At times so great were these powers that the "ghost souls" of certain dead men became gods; in this wise ancestor-worship came into being. Later evolutions resulted from this primitive notion of wandering, separate souls. The next step of the clever, neolithic savage was to evolve souls that never existed in human beings. Everything became animated. In child-life, "chairs, sticks and wooden horses are actuated by the same sort of personal will as nurses and children and kittens. In such matters the savage mind well represents the childish stage" (Tylor, *op. cit.* I, 285). Since these "ghost souls" were out of the ordinary and superhuman, the savage felt their power, invoked their aid, feared their wrath, propitiated them with offerings and finally deified them. It is all very simple to those that have the credulity to swallow Mr. Tylor's dose without making a wry face at the gratuitousness of his whole collection of assumptions. Against the animistic theory is the fact that ancestor-worship is not an important factor in the religion of many savages. Moreover, among tribes that worship dead heroes, there is at times found a nature-worship with which no trumped-up "ghost soul" may be associated. The pygmies of the Kongo, probably one of the lowest of extant races, worship a Supreme Being and not their dead heroes. And the studies of Andrew Lang, 'The Making of Religion' (1909) have led him to hold the "hypothesis of an early Supreme Being among savages, obscured later by ancestor-worship and ghost-gods, but not often absolutely lost to religious tradition" (p. 289).

3. Totemism.—The existence of totemism is undeniable; it is a relation of dependence that a people enter into with a *totem*—an animate object or the inanimate representation thereof. Traces of totemism are found all the world over. Objects of totemic cult, or *totems*, were: in ancient Egypt, the bull Apis (sacred to Ptah), the ape (embodiment of Thoth), the cow (sacred to Hathor), the cat (sacred to Bastis); in India, the sacred cow; among the Canaanites, the stone *phallus* (sacred to Baal), and the wooden *kteis-pole* of Ashera; the Iroquois turtle, the Omaha maize, and so on. Akin to totemism is the worship of a *fetish* (Portuguese *feitico*, "artificial"),—a charm trinket, idol, a child's hand, a claw, a tooth or any such object. It is arbitrary and unscientific to argue from these degenerations to the religion of primitive man. The primitive, monotheistic acknowledgment of dependence upon a Supreme Power has in all these cases been deteriorated into the senseless relationship of dependence that ignorant people have entered into with sticks and stones and animals, just as

happens in West Indian voodooism and in the stupid superstition with which cultured folk of to-day pick up a pin, hang a horseshoe or study the lie of the leaves in a teacup.

One form of totemism or nature-worship which deserves special mention is cult of the heavenly bodies. The chief school in favor of astral cult as the origin of religion is the Pan-Babylonian. According to Friederich Delitzsch, Gunkel and Winckler, of Berlin, together with Jeremias of Leipzig and a host of university scholars in England and America, the origin of Greek, Roman, Old Testament, New Testament and countless other religions of cultured peoples must be sought in Babylonian solar, lunar and astral mythology, an evolution from the worship of the heavenly orbs. At first an attempt was made to set this theory upon an astronomical fact as a foundation. Winckler assumed that the Babylonians knew the precession of the equinoxes; and upon this fiction built up an absurd hypothesis. Father Kugler, the Jesuit astronomer and Assyriologist, then came into the arena and showed that the whole explanation of Babylonian mythological religion was established upon the Pan-Babylonian school's ignorance of Babylonian astronomy and astrology. Recourse was then had to far-fetched analogies between Bible facts and astral phenomena. Jacob had four wives and 12 sons; and so he becomes the moon-god with four phases and 12 lunar months. With equal assurance, the 12 Apostles are relegated to the realm of fiction as 12 lunar months of a moon-god.

4. *Magic*.—Tylor assumes an age of animism that preceded religion. Frazer, J. G., 'The Golden Bough' (1911), postulates an age of magic that preceded animism. This pre-animism was the conjuration of hidden forces. When such conjuration was found ineffective, petition of superhuman powers took its place. Marett, 'The Threshold of Religion' (1909), starts theorising from a life-force, called *mana* in Polynesia and Melanesia; *mana*, conceived as impersonal, led to magic; *mana*, conceived as personal, led to worship.

RELIGION, Established, or STATE RELIGION, that form of religious belief and worship which is recognized by the government or constitution of a country as national and

which enjoys certain privileges and is supported by the public treasury or by tithes. The idea of complete separation of civil government and religious affairs is peculiar to modern times. In the ages before Christianity the administration of religious affairs was a function of the state and the priesthoods were orders in the state. After the triumph of Christianity the relations between church and state in the Roman Empire were intimate and the civil power freely intervened in the government of the Church. The prelates of the Church also were vested with extraordinary powers by the state. Throughout the Middle Ages the civil power was everywhere in the last resort the Church's armed right hand for the enforcement of uniformity in religion. For a long time after the Reformation the uniformity of religious belief and ceremonial was held to be indispensable: in the present age, though in many countries state churches exist, controlled by public authority and supported from the public purse, uniformity is no longer enforced by civil penalties and the subject is permitted to reject the state religion, to embrace another religion or to ignore religion; but in some countries dissidents from the religion of the state suffer certain civil disabilities. It is urged in favor of the national recognition of a form of religion, that if the majority of a nation are prevented from making this public recognition of it, as a matter of primary importance to the state's welfare, then they are subject to coercion by the minority; and if an established church uses no sort of coercion, its being supported by the state in the face of a protesting minority is no greater violation of equal rights than would be its disestablishment at the behest of the same minority.

RELIGION, Influence of the Great War upon. It is generally impossible to estimate the influence of a war until years after the declaration of peace. So many elements of good and of evil are set in motion by the call to arms that the resultant ultimate influence takes time to reveal itself. The process cannot be hurried. This is particularly the case in a world war including diverse nationalities. A struggle of that magnitude is apt to intensify human passions and the selfish interests of the contending nations, who are likely to regard justice and humanity as of less consequence than success in battle and a point of advantage at the peace table. In such an atmosphere, however grandiloquent the sentiments, there is obviously no opportunity for religion to display its power—it must retire from the shuffle-board of the nations and continue a secondary factor in the world's parliament. Yet in the past it has certainly been the direct or indirect cause of war—there has been no century without its authorized representatives or interpreters inciting the nations to conflict for its greater glory or power. Religions of old failed admittedly to appreciate their opponent's point of view. When argument failed, the invariable recourse was to arms. Each was too full of its own divine right to admit the possibility that a rival creed might have its share of that same authority.

Now it is not to be denied that in the era of the Crusades and in later ages, religion sought often to heal wounds made in its name and furnished illustrious examples of kindly and upright men and women identified with the

Church as teachers or workers in various fields who have enriched humanity. On the whole, however, when religion dominated the state, the religions in the customary ecclesiastical meaning of the term were too absorbed by worldly ambitions under specious masks of humility and piety to realize the divine possibilities at the root of their creeds. The countries were still in deep shadows, when Shakespeare — prolific in such anticipations — wrote that it is the heretic who makes the fire, not he who is burned by the fire. It took some centuries before religion began to advance out of the bogs and sandbanks. Not only the historic creeds, but smaller groups of religionists who forgot to exercise toward others the toleration they demanded for themselves, made religion so empty and delusive a phrase that a Madame Roland might well have exclaimed: "Religion, what crimes are committed in thy name!"

It did not take many months after the Great War began for religion and the religious to show tremendous advance, as they arrayed themselves as partners and no longer as competitors, in the world-embracing task of solving vital problems and meeting conditions which had to be faced in every land, as well as on the battlefield and in the battle zone. The new alignment was peculiar to no clime or creed — it was observable everywhere, but perhaps seen at its best in the United States, which, always free from religious propaganda and debarred by its constitution from making religious tests of any kind, was to witness the most superb illustration of genuine religion on the part of all the creeds. In England, France, Italy, and possibly none the less truly among the Central Powers, the influence of religion made itself quickly felt in the organization of national and international agencies to relieve suffering, to restore, to rebuild, to uplift, to strengthen. The team-work among Catholic, Protestant and Jew was immediate and far-reaching. It did not content itself with the giving of money in vast sums in the aggregate, but developed into the giving of self, into personal service unsurpassed in numbers and variety. From the training camp to the battlefield, so diverse in their claims, thousands of men and women of different faiths were foremost as workers for humanity's sake, above creed and race and nation. Rarely, if ever, in the entire history of mankind was so genuine a spirit of religion aroused. It did not call itself by such a name, but it was none the less a translation of religion into deeds that made for human happiness and hopefulness at an era when the greatest tragedy in history was being enacted.

In the United States, the Y. M. C. A., the Y. W. C. A., the Knights of Columbus, the Jewish Welfare Board, the Salvation Army, co-operated as brethren in a common cause. The Red Cross received its financial support and gathered its workers from all. No narrow sectarianism held sway. In the raising of war relief funds all were contributors without distinction of creed. No hut or building, no canteen or facility was selfishly kept for one organization, but when necessary was placed freely at the disposal of the rest. Thus amid the horrors of war, which used to be intensified so as to aid the Almighty to punish the sinner and the heretic, the oldtime hatreds and dissomances among the creeds were resistlessly swept

aside, the high walls of separation became merely lines and the feeling of comradeship and brotherly love was marvelously strengthened.

Many examples of the new birth of religion are told from day to day from sources whose veracity cannot be questioned. In France, an observer, an official in service, writes how Catholic chaplains distributed Jewish prayer books to the Jewish soldiers. At a holy day service not far from the Belgian frontiers, the Y. M. C. A. gave its auditorium at general headquarters for Jewish worship. On a battlefield in Flanders, a rabbi, in the absence of a Catholic priest, held a cross before a dying French soldier and a few moments later the Israelite lost his life as a stray shell exploded. A prominent British official notes that when Sunday came it was no unusual thing to find a series of religious services of all creeds within the same hut back of the front. "At 6:30 will be Communion Service by the Church of England; at 7 o'clock a Roman Catholic Mass; at 8 a Jewish Service, at 8:30 Presbyterian, at 9 the Free Churches, and at 10 the Episcopalian Service again." As in the United States, in England, too, every British war service agency, by whatever church, synagogue, chapel or meeting hall originated, joined hands in the common cause. Such instances of co-operation of the creeds could be multiplied in gratifying numbers. As to the influence of war in checking racial prejudice, what better illustration can be furnished than the United States War Department's naming a camp after a negro soldier, Camp Alexander, at Newport News, Va. No less significant was the action of the Red Cross Canteen Committee of Chattanooga in distributing food and postal cards and writing letters home for a regiment of negroes.

Now a critic might say: Are not these examples due to transient influences, the sense of common peril, the feeling of *esprit du corps* as is witnessed at school or college, among bodies of business or professional men, without the slightest connection with religion?

The universal sentiment, the broad unsectarian and undenominational atmosphere, this magnificent exhibition of team work unexampled in the entire history of the religions, points to a more significant underlying force than a mere feeling of comradeship, a sense of common danger. Its depth and universality indicate a character more than transient and not due to the circumstances of the hour and scene. A nation that contributes its millions to a war chest in which all elements of the population, rich and poor, Christian and non-Christian, contribute in a spirit of noble emulation, is not likely to forget the lesson, nor will it cherish bigotry in the future in any marked form. The Red Cross, which has raised its millions and hundreds of millions from representatives of every class, creed, sect and color, has enriched the globe in more senses than one and given its cup of refreshment not to the suffering soldier only, but to a world that needed a permanent revival of religion in its genuine form. The fact, too, that these agencies for human relief were largely organized by representative religious bodies and supported mainly by them indicates the vital character of the movements as expressing the sentiment of the creeds in this 20th century. They could not prevent war — they could mitigate its horrors and furnish an ex-

ample of brotherhood, helpful and hopeful for the future.

Religion has been limited to the religious shrine, to the beauties of ceremonial, to sacred memories and associations, to the fragrance of incense and swelling music. It is held by many to be a rich keepsake of traditional rites and terms of wonderful potency. Others, with as good, if not better, authority, see religion as an active, not passive, force in human life and affairs. It is a power never designed to be a sedative, merely to promote pious contemplation at stated times, but one whose highest aim is to awaken us to practical goodness, not good thoughts alone. It is an influence that ennobles and sanctifies, an atmosphere in which nothing wrong, hurtful or evil can exist. Thus defined it is showing its reality amid stirring years of strife, as it spreads its blessings in a thousand ways, in the wondrous compensations of the Creator; and it trains men and women to be creators in His spirit, as they diffuse kindness, and mutual respect, giving to all the open hand and heart. If it takes war to bring about this result, peace will not long witness its negation.

As to the relation of war to the religion of the individual, perhaps the finest aspiration appears in a letter, dated 9 September, from a sergeant on the battle front in Flanders, to his father, a Georgian clergyman: "War of course may call forth a latent power of self-sacrifice. God grant that some of the heroism and courage now being so prodigally lavished on the battlefield may persist in the days of peace and used in raising up and building anew a broken-down world." ABRAM S. ISAACS.

RELIGION, the Psychology of. The psychology of religion, which originated in this country about 20 years ago, is the application of the principles of general psychology to the interpretation of religious phenomena. It rests upon the fundamental assumption that religious experiences, viewed psychologically, must be of the same essential nature and subject to the same laws as other forms of human conduct.

The first religious phenomenon to be studied was "conversion," as the term is used in the American Protestant churches popularly called "evangelical" or "evangelistic." These denominations insist that the individual must consciously pass through some inward transformation of his personality as an assurance of divine acceptance. Their members in consequence had often learned to watch their mental states and to describe such marks of presumed divine favor as they might have inwardly experienced. The phenomena of "conversion" thus furnished a favorable field for American psychological investigation. Though preceded by monographs and journal articles by other writers of whom G. Stanley Hall and James H. Leuba have remained the most important contributors in this field, the first comprehensive studies to be published in book form were 'The Psychology of Religion' by E. D. Starbuck (1900), 'The Spiritual Life' by G. A. Coe (1900) and 'The Varieties of Religious Experience' by William James (1902). The methods employed in these three pioneer volumes were respectively the questionnaire, the questionnaire supplemented by interviews and experiments chiefly to determine temperament and degree of suggestibility, and the interpretation of startling religious experi-

ences recorded in autobiographical literature. Though these imperfect methods led to mistakes, they were successful in establishing broad general conclusions.

The following principles in regard to conversion may be regarded as now fairly well established. A changed attitude toward religion some time during adolescence is a very common, and in the opinion of most writers a normal, phenomenon. This transition may assume one of at least four types: (1) a state of emotional depression and poignant self-reproach ("sense of sin"; "sick soul") followed by a state of elation and joy felt to be an assurance of divine acceptance; (2) a feeling of incompleteness and lack of appreciation of religious beliefs and practices followed by a greater maturity of apprehension and attendant peace and joy and sense of divine presence and favor; (3) a sudden attainment of the last state mentioned without previous depressed feelings of "sin" or "incompleteness" ("spontaneous awakening"); (4) a "gradual growth" without conscious transitions, in which a mature appreciation of religion insensibly supplants the more limited intellectual outlook and emotional capabilities of childhood ("healthy-mindedness"). All four of these types would now be regarded as cases of "conversion" by most American denominations insisting upon "conversion" as essential for salvation, and this broader denotation will be followed in this article. However, many psychologists restrict "conversion" to the first two types, which are thus set in opposition to "gradual growths" and "spontaneous awakenings." The two principal factors that determine which of these four types will be experienced by any particular individual are his own temperament and other factors in his personality on the one hand, and on the other, the kind of experience suggested to him by the pressure of his religious milieu. Coe has analyzed these factors carefully. The first two types are likely to be experienced by adolescents who expect such transformations, in whose temperaments sensibility rather than intellect is predominant, and who have a tendency to automatisms and passive suggestibility. Among factors that Starbuck has shown to be influential in determining the age of conversion are sex, age of puberty, and period of most rapid growth; and all of these combined with the age of conversion itself have an influence upon the character of the experience, e.g., determining how far distinctly intellectual features will be present. Conversions to religion among adults are rarer, since they involve the reorganization of a mature personality instead of merely the completion of an immature one. When they do occur, they are usually of the first two types. Phenomena similar to all four types of religious conversion have been noted in experiences of a different nature, such as conversions to "infidelity," "falling in love" and "falling out of love," sudden changes from prodigality to miserliness, etc. So psychological justification may be found for the popular practice of speaking of a person's "conversion" to a belief, practice or manner of living, whenever a profound change in emotional attitudes and ideals has occurred. The phenomena of conversion are explained in terms of the sub-conscious mind by those who accept that doctrine. Undoubtedly they are instances of the coming to dominance in attention of pr-

viciously unheeded processes that have been developing in the peripheral consciousness and in the nervous system.

The phenomena of religious revivals are all explained in terms of the well-known laws of imitation and suggestion and crowd psychology of Tarde and Le Bon. (See article on SOCIAL PSYCHOLOGY). The external suggestions of the revival in a few instances precipitate developments that have been incubating in an individual's memory, force them on his attention and effect in his character a transformation that otherwise would have come more slowly or possibly not at all. But the vast majority of revival conversions are "pseudo-conversions," i.e., behavior induced solely by crowd suggestion to which nothing deep-seated in the individual's personality responds, and they are consequently transient in their effects. Often the pseudo-convert loses respect for religion, and in many cases he is injured mentally and morally by the excitement through which he has passed; so religious psychologists as a rule criticize revivalism severely. (Ames; Cutten; Coe; Davenport).

Other religious phenomena that have been investigated by psychologists, though usually with less thoroughness, include mysticism, prayer, saintliness, sanctification, ecstasy, inspiration, faith, visions, mental healing, miracles and witchcraft. None of these involve psychological principles essentially different from those found in conversions and pseudo-conversions. All involve developments that have previously gone on in the organism without having become organized in the personality, so that their more or less abrupt entrance into the focus of attention appears mysterious and is often in consequence assumed to be supernatural. Underhill has found five stages in the experiences of mystics which appear to constitute a repetition of states in some respects analogous to conversions, each however being more profound and comprehensive than its predecessor. This "mystic way," attended by marvelous visions and other automatisms, is possible only for those who have a talent for this sort of thing, and cultivate it by systematic effort. Strong has found prayer to be "an imaginative social process," arising in consciousness between an ego and an Alter, and that types of prayer may be distinguished as "ethical" and "aesthetic" as emphasis is laid on the needs of the ego or the glory of the Alter. Psychological studies of some of the great figures in religious history have occasionally appeared; among these the elaborate work upon Jesus Christ by G. Stanley Hall is the most important.

The developments of religious experience in savage races of the present time (which may be assumed to be more similar to primitive mankind than civilized races) and also in the great historical religions have been interpreted from the psychological standpoint. Here the rich data contained in the reports of anthropologists and historians and in sacred literatures have been available for study. Primitive religion has been shown to be more or less closely connected with primitive magic, while its connection with primitive morality is less intimate. Whether religion has evolved from magic, or whether both have evolved from an undifferentiated form of behavior, is in dis-

pute. It is certain that religions always develop within social groups, and that they always attempt to conserve (and also as some think, to enhance and even to create) values that are recognized by groups to be desirable. King and Ames have attempted to state this characteristic of religion in terms of functional psychology. It is now very generally agreed that there is no distinctly religious instinct in the sense that there are instincts of fear, pugnacity, sex, etc. McDougall and others however, believe that certain instinctive emotions, notably fear and wonder, are basic in the evolution of religion. Seashore maintains that there is a peculiarly intimate connection between the play impulse and religion. Wright believes that sentiments toward supernatural beings may on occasion develop from any of the principal primary instincts, but that in any case the religious sentiments rest on instinctive foundations.

Since there is no mental element or process or mode of behavior that is distinctively religious, and so would logically serve to differentiate religion, is it possible to arrive at a definition of religion in psychological terms? Ames, Coe, King and others, looking for a definition of religion in terms of values, regard religion as a process in which values of a distinctively social character are heightened and intensified. Regarding such attempts to define religion wholly in terms of values as vague and unsuccessful, another group of writers believe that religion can be more clearly differentiated through the attitude assumed to the agencies by which the values are believed to be achieved. The agencies, whether fetishes, gods, a single God, or the universe conceived as a spiritual order, or what not, are always non-human entities toward which man assumes the sort of behavior that he ordinarily manifests toward his fellow human beings. (Leuba, Watson, Wright). Similarly, but with more emphasis on beliefs and institutions, Durkheim defines a religion as "a unified system of beliefs and practices relative to sacred things, that is to say, things set apart and forbidden — beliefs and practices which unite into one single moral community called a Church, all those who adhere to them."

While agreement upon a psychological definition thus has not yet been achieved, it is at any rate generally agreed that religion is mainly an affair of social rather than of purely individual experience; that it is primarily affective and volitional rather than cognitive though it involves all phases of consciousness or behavior to some extent; that it is a process by which the individual assimilates and realizes within himself the values of the social order and achieves a corresponding development of his personality; and that the influence of religions on individuals and societies is at least more likely to be conservative than otherwise. Myths, dogmas, rituals and ecclesiastical organizations, though perhaps fundamental to religion in its maturer phases, are accordingly to be interpreted as mainly products rather than causes of religious activity.

While the psychology of religion professes to be a purely empirical description and explanation of religious experience, its writers have not entirely avoided normative and transcendent problems, though American writers, at

least, have endeavored to exclude them from their premises and data, and to introduce them, if at all, merely as deductions from conclusions reached in a strictly scientific manner. Though not itself a normative discipline, the psychology of religion may properly suggest to teachers methods of religious education, and indicate to social reformers and statesmen the possible service and limitations of religion as a factor in social and moral progress, and it may even assist theologians in determining attainable ideals for religious aspiration.

Both those who believe in religion as a revealer of knowledge and those who reject it as a survival from times of superstition have claimed the support of the psychology of religion. Since religious experiences involve an influx into conscious attention from fields outside of personal awareness, much has been made of James' suggestion that this influx may come in part, as it seems to the religious person to come, from a source entirely external to him in the universe that might be called God. Cutten adopts this suggestion, and attributes conversion and other forms of religious experience to "the action of God upon the sub-consciousness." On the other hand, since the conceptions of the gods are projections of human social experiences and change with changing civilizations, and since all religious phenomena are referable on their psychological sides to individual and social origins which can be analyzed for the purposes of psychology without taking into account the hypothesis of an objective God, it has been argued that atheism—or at least agnosticism—is a necessary deduction from the psychology of religion. It would seem that if the psychology of religion is to maintain its position as a strictly empirical science, its data and conclusions should be kept entirely free from such transcendent questions, as are those of physics and astronomy. Questions concerning the nature and existence of an objective God and other matters of religious faith belong, not to psychology or to any other science, but to metaphysics. They are, to be sure, legitimate metaphysical questions which the philosophy of religion should attack by metaphysical methods, reinterpreting the data of all the sciences, including the psychology of religion, for the purpose. It is even legitimate to combine discussion of psychological and metaphysical problems of religion in a single treatise, and each discipline may be helped by the process. In fact, the science of the psychology of religion got much of its first impetus from the psychological portions of such primarily metaphysical treatises as those of Höffding and Sabatier on the philosophy of religion, and the psychology of religion in turn has contributed much to such metaphysical inquiries as Royce's 'Problem of Christianity.' But the psychology of religion is an empirical science, and must adhere consistently to scientific methods of analysis and investigation.

RELIGIOUS EDUCATION. The phrase "religious education" began to take on a definite and technical meaning only in the 20th century. Up to that time there is scarcely any trace of its use; to-day it has a recognized place in current educational coinage. Its primary significance is not so much that of instruction in a category of subjects or lessons on religion, but in general it describes that type of education which gives full recognition to the religious nature of the persons being educated, the religious and moral forces operative in their development and the religious, spiritual, aim of all education. It is the distinctive phrase of the movement which seeks to complete the aims of general education by the inclusion of the elements commonly called

religious; these include racial and world heritages of ideals, concepts, interpretations and values of life in terms of the spiritual, training in habits and conduct and the development of motives and purpose in life. It includes and emphasizes instruction in the history and literature of religion as the means of securing the heritage of ideals, but it insists still more on the wider aim of developing the person who will live a life essentially religious, governed by developing spiritual ideals. The concept of religious education has helped to give a deeper meaning to education by calling attention to the spiritual needs of the person. It has given new significance to religious activities by suggesting their educational character and responsibilities. It has made men think of education in terms of the religious ideal and of the religious aim and ideal as realized by educational processes.

The movement for religious education owes its modern inception and its present impetus to the vision of educational idealists such as Herbart, Froebel, Spencer and Dewey who conceived of education in terms of life and as embracing all life, to leaders in the spiritual like Gladden, Coe, King and others, who taught us to think of religion in terms that lift it far above its own records, analyses, philosophy and literature, and to practical educators, like W. R. Harper, who could see the problem of securing to each person his full heritage of the world's spiritual idealism and opportunity. The movement for religious education instead of forcing ecclesiastical formularies upon the schools and colleges has widened the meaning and field of education, and has given it a deep, spiritual meaning. Whether in the agencies of the Church or in those of the State, religion and education are seen as inseparable processes of *life development*.

The notion of religious education expresses the idealism of the modern revolt against formalized education. General education passed from the restraints of a class privilege to become little more than a system of mass, mechanical, intellectual discipline, a formal and largely perfunctory initiation to the rights of citizenship. Its technique was that of mental processes. Its aim was the acquisition of bodies of information arranged in a series of fixed steps which led up and out of schooling. Its tests were almost exclusively intellectual. Its professional interests were largely confined to methods of formal disciplines. But modern psychology revealed the person as a complex of powers; it insisted both on the breadth of the life as embracing much more than the so-called mental powers and on its unity so that every power of the life entered into the making of the person. Moreover modern social studies indicated that the formal, intellectual disciplines of education were failing to train persons competent in vision, motive and habits for the strain and opportunities of present-day living. It became evident that if education would really develop persons it must deal with them as *lives* and not alone as memories. It must include, by some means, the range of motives, ideals, emotions, the habits and the will and all that determines character and conduct. A new conscience for personality arose in education.

Along with the new conscience in education came new concepts in religion. It passed again into the realm of life. Quickening social re-

sponsibility brought religious thinking close to reality; it became concerned with people. It was seen that if its ideals were to be realized it must be through persons intelligently governed by those ideals. Seeking to save society the churches are coming to see a program of growing an ideal society by developing ideal persons, an educational program. The child has come to have a new importance because his life is at its determinative, developing period and because he may be trained to become an effective religious person. One can have religious persons only as such persons are trained; the time to train them is in the developmental periods and the scientific methods of modern education are the truly religious methods of such training.

Further the demand for religious education arose from a quickened public conscience. With a rapidly rising wave of juvenile delinquency it was evident that the young were not being adequately prepared for the elemental duties of living. The general curriculum was much richer than in former times, but it was poorer in that it failed to include the elements that make for strength and ideals in character. The disciplines that failed to include discipline in the art of living were inadequate for the demands of life. In the realm of conduct something is required beyond knowledge; ideals must be developed, the motives formed, the will trained. The realm of judgments, motives, ideals of life and will to live is essentially the realm of religion. Training in these respects is religious training. In meeting the problems rising out of the recognition of the need for such training the schools have been compelled to look to the religious agencies for aid.

Religious education in the United States has received stimulus on account of the relations between the agencies of religion and those of education. The people of the United States are entirely committed to the policy of the separation of Church and State. This involves the separation of the work of the schools from that of the churches. Instruction in religion is the responsibility and privilege of the churches.

The public agencies of education cannot give formal instruction in the subjects of religious history, philosophy and methods as such because (1) Such instruction would be "sectarian." It might be Christian in the broadest sense; but nevertheless, this is a land of absolute religious freedom, a land where, within the limits of the civil law, all faiths have equal rights. Public money cannot be legally nor ethically devoted to teaching Christianity as such. (2) Such instruction, if attempted by the public schools, could never be satisfactory to the religious agencies. It would be sure in some instances to run counter to cherished beliefs. Nor is it possible to agree in the schools on a common creed. Even in the churches all attempts to agree on a common creed have resulted in such a planing away of the parts as to leave nothing at all. Even though the creed were reduced to the briefest, barest possible terms, the objection would still hold that such a creed, formulated for the public schools, would be the creed of the schools, and they would become creedal institutions. (3) The teaching of religion in any such a formal manner and even in any so innocent a form of matter would be an invasion of the peculiar privilege

of the churches. (4) Formal religious teaching in these schools would not attain the object desired; it would result, as the German system has resulted, in the formalization of religion until it is destitute of practical, vital meaning to the child. (5) Sectarian teaching means sectarian interference. Under the paralyzing effect of denominational oversight, of fear of offending on this hand and that, the teacher would be without the freedom of life and the teaching without direct character values. (6) Public school teachers are neither trained nor selected for the work of teaching religion.

With such a situation in every community there has fallen on the religious agencies the burden of the instruction of children in the subjects of religion. That task was, for 10 decades, relegated to the *Sunday school*. But rising educational standards indicated the inadequacy of this school with its brief weekly period, its corps of purely amateur and untrained teachers and its lack of any sort of physical equipment. It lacked professional leaders, educational ideals and standards of work. It was expected to accomplish specific instruction in religion when it lacked educational standing and consciousness. In fact it had no plan of instruction in its own field, in religion, as it attempted no more than perfunctory instruction in certain parts of the Bible. Along with the revival in educational science came a quickening of scientific interest in religion, especially in its literature and its phenomena. The churches had laid upon them a difficult task, to meet the demands of this new interest, to furnish instruction which could meet modern, prevalent, scientific concepts and to meet the need for religious instruction of the young with plan and plant recognized as totally inadequate and inefficient. Leaders in the different churches began to see the seriousness of the educational need; they began to seek for religious educational leadership. They found it through the work of the Religious Education Association. (See RELIGIOUS EDUCATION ASSOCIATION). Before long there developed leaders who began to interpret the work of religion in educational terms.

The development of religious education in the churches has been marked by: (1) The educational reorganization of schemes of instruction. The Sunday school has become, in many instances, a real school. Courses of study are now provided, in a variety of forms, for as many as 20 different grades, from the youngest to the adults in a school. The material includes religious history, teachings and ideals both in the Bible and outside, ancient and modern problems of present-day living and social organization. At least 250 textbooks are available, nearly all having been prepared since 1903. This elaboration of curricula has taken place in practically every Church communion, including the Roman Catholic, the Hebrew and the Mormon. It brought about the complete reorganization of the International Sunday School Lesson Committee which formerly prepared one single lesson for all scholars in all Protestant schools; a new committee prepares schemes of graded lessons, a different lesson for each year of the pupil's life. (Consult Cope, H. F., 'The Modern Sunday School and its Present Day Task'; also Athearn, W. S., 'The Church School'). (2) The provision of suit-

able facilities for the work of instruction in religion. A very large number of churches now provide special buildings for their general educational work. There have classrooms with regular equipment, often gymnasiums, and facilities for play, recreational and social activities. (Consult Evans, H. F., 'The Sunday School Building and Its Equipment'; also Cope, H. F., 'The School in The Modern Church').

(3) The development of professional leaders in religious education, especially for the organization and direction of work with the young. Leadership is passing from the amateur to the trained expert. Hundreds of churches are employing persons who have been trained in special courses in psychology, pedagogy and educational method as superintendents of church educational work, including Sunday schools and as teachers. The Religious Education Association established a professional standard and lists nearly 200 persons as 'Directors of Religious Education in Churches.' These all have had several years of graduate study of a technical character. A special organization of directors exists. (Consult *Religious Education*, April 1914, p. 186; Oct. 1915, p. 444). (4) The Church communions have provided specialized leadership in religious education by organizing what are known as commissions on religious education. Among the more active and important commissions are those of the following churches: Episcopal, Secretary Wm. E. Gardner, New York; Baptist, Secretary Prof. E. DeWitt Burton, Chicago; Congregational, Secretary Rev. F. M. Sheldon, Boston; Presbyterian in Canada, Secretary Rev. J. C. Robertson, Toronto; Disciples, Secretary R. M. Hopkins, Cincinnati; Methodist, Secretary Dr. Edgar Blake, Chicago. The commissions outline advanced plans of religious education in churches, communities and families. The official denominational organizations are also federated in what is known as the Sunday School Council of Evangelical Denominations for the common supervision of the work of this group of churches in this field. This body has effected a common organization with the International Sunday School Association for the promotion and supervision of work in this field. The Federal Council of Churches also has a commission on religious education. (5) The special preparation of ministers of churches for religious educational work. In 1903 the Hartford School of Religious Pedagogy was organized. In 1906 a chair of Sunday school pedagogy was established in the Southern Baptist Theological Seminary. In 1912 50 theological seminaries made provision for one or more courses training ministers for educational work in the churches, 10 of the seminaries having chairs in religious education. In 1919 all the larger seminaries provided such courses and many colleges were offering work in religious education both as preparatory to theological seminary courses and for layman.

In Relation to Public Education.—The recognized necessity for courses of instruction in religion available to all school children led to the organization of a field in which both the churches and the public schools could operate without official relations under what is known as the plan of correlated Bible study. In 1914 an arrangement was made by which students at the Colorado State Teachers' College, Greeley,

Colo., could receive not to exceed two units of credit for the study of the Bible outside of the college in church classes under academic regulations. Later this plan was extended to apply to students in high schools through the State. In 1912 a somewhat like plan was adopted in North Dakota by the State Teachers' Association. It provides that high school students may follow an official syllabus of Bible study and upon passing an examination conducted by the State Teachers' Association receive not to exceed one-fourth of a unit of credit per annum. Several plans are now in operation in a number of the States. A further and different development has taken place, beginning at Gary, Ind., by which children in the public schools may be excused at certain periods in order to attend classes conducted according to schoolroom standards in their churches and this without prejudice to their standing in the public school. None of these plans call for the use of either the property, the funds, the authority or the professional workers of the schools as such. Care is constantly exercised so that there is no sort of official relation between the churches and the State, but the plans have resulted in very much larger numbers of young people receiving regular and systematic instruction in their different churches and Sunday schools, instruction which has been correlated to their week-day work. Similar plans are followed in Toledo, Ohio, Birmingham, Ala., and in numerous lesser communities in Illinois, Indiana, Oregon, Montana and elsewhere. In New York City an influential interdenominational committee promotes the instruction, on week-days, of thousands of children in Hebrew, Catholic and Protestant churches. The Daily Vacation Public School Movement adopted by many church communions provides for week-day religious instructions during the summer period. The fact remains, however, that there are probably 70,000,000 of persons of school age in the United States who are receiving no formal instruction in religion.

In the Family.—The problem of the religious instruction of children has been peculiarly complicated in the United States by the fact that, while the public schools have been necessarily debarred from this work, the breakdown of family customs due to settlement in a new country has largely deprived the family of its function in regard to religion. Changing social and economic conditions have effected a similar result so that it is not possible to count on any general custom of instruction in religion in family life nor on any effective degree of religious training in habits and ideals. Doubtless some awakening has been effected. Several organizations have given serious attention to the problem of religious education in the home, notably the Religious Education Association which held a convention on the subject in 1911 and has published much useful material on the problems involved. Other organizations touching the matter are The Mother's Congress, Philadelphia; L'Unione Familiare, Paris; League for the Popularization of Pedagogy for Families, Brussels, publishing up to the outbreak of the war *Educations Familiales*; the Home Progress Society, Cambridge, Mass.; After School Club, Philadelphia. The impressive Child Welfare Exhibits also aided in calling attention to this

need. Consult Hodges, George, 'The Training of Children in Religion'; Cope, Henry F., 'Religious Education in the Family.'

In Communities.—In 1917 serious attention for the first time was paid to the possibility of organizing a system of religious instruction which, while remaining independent of taxation and upon a voluntary basis, should parallel the system of public instruction. It was realized that the current plan of separate schools in churches, meeting only once a week and for a brief period, was entirely inadequate and highly wasteful. The International Sunday School Association proposed a plan of schools created by community boards of religious education and quite independent of churches. The plan attracted wide attention; but it met with much opposition and little practical support, principally because of the proposed divorce from church control. However, numerous experiments were made in the organization of communities for the training of religious teachers and much serious attention continues to be given to the possibilities of common, united action, for it is realized that the largest possible contribution to a united religious life would be to give to all children a common, unified training in religion. Consult Cope, Henry F., 'The School in the Modern Church'; Winchester, A. S., 'Religious Education and Democracy.'

In Relation to Public Schools.—Even with its recognized limitations the public schools have not been indifferent to the child's needs for religious education. The voluntary organization of public educators, the National Education Association, has declared in formal resolutions "The building of character is the real aim of the schools" (Resolutions of 1905 and similar statements in conventions of 1910 and 1911). In current literature on general education of children there is clear recognition of the fundamental place of training in motives and habits of conduct. The notion of "dealing with persons as behaving organisms" (Bagley in 'Educational Values') and "the aim of social efficiency" (Dewey in 'My Educational Creed') are characteristic of the thinking of leading authorities. The Religious Education Association organized several important conferences of public school leaders on different phases of moral training in the schools and in 1916 conducted an important convention in Chicago on the relations of religious instruction to public education, discussing particularly the various schemes of correlation between the work of instruction in religion in churches and the work of public schools. In 1915 the National Education Association offered a prize for the best essay on the place of religion in education and a scheme for religious instruction in public schools. On the other hand the Religious Education Association has steadily refused to endorse plans for religious teaching in public agencies and has sought to develop the voluntary agencies to efficiency in this field.

Activities in the Colleges and Universities.—The problems of teaching religion and imparting religious training in colleges and universities have not been neglected in recent years. Numerous colleges have introduced new courses, engaged new and highly trained instructors in the Bible and other aspects of re-

ligion and generally, in almost all colleges, this work has been brought up to a higher academic level. More men and women of thorough training are engaged in teaching religion in this field than ever before. They have a special professional organization of their own in the college department of the Religious Education Association. Besides courses in the Bible there began to be introduced in the American colleges, in about 1908, courses in religious education, courses designed to train young people to usefulness in the organization and teaching in religious agencies. In 1919 there were over 200 standard colleges offering courses in this field, looking forward to the usefulness of the graduates in work in religious education, especially training teachers and specialists in this field. In State universities, separated from ecclesiasticism just as public schools are, there is, however, greater freedom in the teaching of religion because here it is lifted into a higher realm of free discussion and of pure scientific thought. Some State universities offer courses in religious literature, nearly all in the history of religions, some in philosophy and psychology of religion and some provide for courses in religion given in accredited institutions adjacent to the university. The real problem of all institutions of higher learning as it relates to religious education is not, however, so much in the realm of formal courses in religion as in the matter of securing in the institution the prevalence of ideals, the rule of customs and atmosphere that will train the students in habits of religious living, and will interpret life to them in essentially religious terms. In many universities this is consciously the most serious endeavor, to send out men and women to whom life means a chance to realize high spiritual ideals.

In an increasing degree the phrase religious education is coming to mean to large numbers of persons the interpretation of every activity and aim in life in terms of character results, to see all as judged by the effects on persons, by the product in character and in the permanent worths of life. It has come to mean a new interpretation of religion as not alone a body of literature or philosophy, and still less a form of organization or custom, but as a force of ideals working in life to develop finer persons, to interpret the world in the light of the values that endure, the values of thought, ideal and hope. Religious education seeks to organize society, through all agencies of instruction, habituation and idealization, so that out of all the process of life there may grow religious persons and there may develop a society that will make a religious world.

HENRY F. COPE,
General Secretary of the Religious Education Association; Author of 'Religious Education in the Family,' etc.

RELIGIOUS EDUCATION ASSOCIATION. The, was organized in February 1903 at a convention called to consider "the improvement of moral and religious education." The movement began under the inspiration of William Rainey Harper, then president of the University of Chicago, who organized a "Council of Seventy," first to promote modern, scientific biblical study and, later, to develop the necessary organization for promoting religious education. Other well-known educators associated

with the beginnings of the organization were Dr. Charles Cuthbert Hall, Dr. Frank Knight Sanders, Dean Shailer Mathews, Pres. William Douglas Mackenzie, Pres. James B. Angell, Prof. John Dewey, Dr. William Hervey and Pres. Henry Churchill King. The organization states its purpose as: "To inspire the educational forces of our country with the religious ideal; to inspire the religious forces of our country with the educational ideal; and to keep before the public mind the ideal of Religious Education and the sense of its need and value."

It brings together in one comprehensive organization the leaders and workers of all ecclesiastical, evangelical, educational, cultural and social organizations who wish for fellowship, for mutual interchange of thought, information and experience, and for co-operation in achieving the highest ideal of personality and citizenship. By means of this organization of leaders, it promotes the interrelation of all existing agencies of religious and moral education, for mutual service, understanding and sympathy, for economy of effort, for friendly co-operation and for united strength. It also surveys the whole field of religious and moral education, promoting a study of conditions, reporting the organized and individual forces at work within it, fostering thought, discussion and experiment, determining the principles and the methods of progress.

It enlists in a united membership and fellowship of service all persons, in all walks of life, who desire to secure the improvement of homes, churches, schools and other agencies in the work of moral and religious instruction and training.

The Religious Education Association has a membership of 3,000 persons paying the annual fee of \$3; the money necessary for its extension work and its free services to persons seeking counsel is contributed by other members who elect to pay \$5, \$10 and upward, and by persons who make generous gifts to this work.

The Association conducts a *bureau of information* to meet the need for a common source of reliable information on modern work in religious education. Through its officers it gathers up the facts on modern methods from all parts of the world. This information is classified in the office and constitutes, with the extensive library, the working basis with which to answer thousand of inquiries annually.

The central office acts as a *clearing-house* on methods, material, literature and information. All inquiries receive careful attention and are answered by the aid of department officers and specialists and the exhibit library. Whenever literature on the subject of inquiry is available it is sent to inquirers. Numerous pamphlets, bibliographies, reprints, etc., are on hand for free distribution. The services of the bureau of information are free to all.

The bureau also aids many inquirers personally. The offices are open to the public, and at the headquarters of the Association, at 1410 East Fifty-seventh street, Chicago, a permanent exhibit of materials has been installed. This exhibit now consist of: (1) A library of over 6,000 books, consisting of works on methods, principles and materials of religious and moral education. The textbook selection shows material now available for use in Sunday

schools, colleges, etc. (2) Lesson helps, text-books, outline material and printed matter used in Sunday schools and similar institutions, intended to reflect the best material and methods. (3) Pamphlets and illustrative material on moral education.

The Association holds annually an international convention. These conventions, to which the public is invited, but at which members have special privileges, already have an international fame for their splendid array of noted speakers, the importance of the topics discussed and the character of the attendance. Each convention program includes over 100 speakers and 30 different meetings.

The membership of the Association is divided into departments which are organized about institutional interests for co-operative study of their problems and the improvement of their methods of religious education, by correspondence and conference, especially at the conventions, enlisting the services of many leaders and specialists. The Association has published five large volumes, containing authoritative, modern scientific treatment of the most important problems of the home, Sunday school, public school, college, university, church, library and other educational agencies, and it also issues the bi-monthly magazine, *Religious Education*.

RELIGIOUS LIBERTY. See **LIBERTY, RELIGIOUS**.

RELIGIOUS ORDERS. See **ORDERS, RELIGIOUS**.

RELIGIOUS PAINTINGS. See **PAINTINGS OF THE GREAT MASTERS**.

RELIGIOUS SECTS. From the earliest days of the world's history man has been more or less a religious creature. Almost invariably he has had a god, or several of them, to whom he looked for protection. At times these gods have been crude fetishes of whittled wood or roughly hewn stone; at times they have assumed the form of animals or reptiles, or have appeared as cruel monsters eager for the life-blood of those who revered them. But, however they may have come, man has worshipped them, because religion, as represented in the worship of a supernatural power, is interwoven with the entire fabric of human nature. The religious "sect," however, is of more recent origin, for while primitive man could worship his crude fetishes blindly, it was necessary that he should learn to think before he could attempt to distinguish between the various attributes of the Infinite, that from them he might construct those well-marked divisions of faith, or creed, which are such an inevitable result of the varying phases of human thought. To-day the term "sect" is applied to those bodies of men who have announced their decisions to follow the opinions or doctrines of some philosophical or theological teacher. Of course, to the Roman Catholic all religious bodies that are not actually in affiliation with her communion are classed as sectarian, but such a definition is not the general one, the word "sect" being used to differentiate separate organizations rather than to call attention to comparatively inconsequential differences of opinion. Thus, for example,

the High and Low Church factions in the Church of England, or, in this country, the Protestant Episcopal Church, are not regarded as separate sects but as parties, or schools, within the same communion; whereas the various bodies of Baptists in America are denominated as "sects," not so much because of their differences in doctrinal matters, which in some instances are slight, but for the reason that they are under separate Church government. While there were sects among the ancient Jews and Greeks the coming of Christianity, with its wide field for speculation, opened the way for a more general promulgation of individual opinion and the following list of the most important organizations of this and other days indicates that there has been no lack of teachers and prophets to preach new gospels to those who would hear:

ABECEDARIANS.—A sect of German Anabaptists, led by Nicholas Stork, a weaver, who opposed the simplest forms of education, even the learning of the A B C's, on the ground that it prevented divine illumination and hindered spiritual sanctification. Extinct.

ABELITES.—An African sect which opposed procreation on the ground that it was a perpetuation of sin. Extinct.

ABRAHAMITES.—An obscure Bohemian sect of deists. Its members rejected all distinctively Christian doctrine, with the exception of the Lord's Prayer, which they used, adopting the tenets of the religion of Abraham as contained in the Decalogue. Extinct.

ABYSSINIAN CHURCH.—That branch of the Christian Church that has been established in Abyssinia for many centuries. It is in agreement with the Coptic Church concerning its ritual and practice, but differs from it slightly in its theological position.

ACACIANS.—An Arian sect which occupied a theological position half way between the Semi-Arian and the extreme Arian, or Anomœan sects. Extinct.

ADAMITES.—Several attempts have been made to revive the sect of Adamites, which was first suppressed in the 2d century. Its pretensions are that its members have attained the primitive purity of Adam and are, therefore, able to dispense with marriage and to go without clothing at their meetings, which are called "paradises." Upon each appearance it has been proscribed, the last attempt at rejuvenation having been in 1848-49.

ADELPHIANS.—A branch of the Euchite sect. Extinct.

ADMONITIONISTS.—The followers of Thomas Cartwright, who, in 1572, advocated the government of churches by presbyters instead of bishops and who urged the right of the Church to hold supremacy over the state. Extinct.

ADVENT CHRISTIAN.—The largest branch of Adventists. Absolutely millennial in character, it teaches the final extinction of all evil as well as the renewal of the earth that it may become the future abode of the saints. See **ADVENTISTS**.

AERIANS.—A reforming sect in the 4th century now sometimes considered to have been a forerunner of modern Presbyterianism. The members declined to permit prayers for the dead, repudiated the Church fasts, and made the authority of the presbyters equal to that of the bishop. Extinct.

AGE-TO-COME ADVENTISTS.—One of the many sects of Adventists. Its members believe that at the time of the millennium Christ will assume a personal rather than a spiritual rule over the earth which, they hold, will not be destroyed at the Second Coming. See **ADVENTISTS**.

AGNOSTICS.—While unorganized as a sect agnosticism teaches the theory that it is impossible for man to attain to any definite knowledge of the divine power.

AITKENITES.—A party which was founded in the Church of England about the year 1850, by Robert Aitkens, a ritualistic clergyman. It was an attempt to graft a portion of the tenets of Methodism upon the High Church school of ritualistic and sacerdotal theology.

ALBANESES.—A mediæval sect closely allied to the Albigenes. Extinct.

ALBIGENSES.—A name applied to the anti-sacerdotal sects that revolted from the Church of Rome during the 12th century. They were vigorously persecuted and finally exterminated.

ALLENITES.—The followers of Henry Allen, who preached the peculiar doctrine that all souls were actually present at the Garden of Eden where they participated in the fall of Adam. Extinct.

ALOGIANS.—A name applied to a heretical sect of the 2d century because of its rejection of the doctrine of the Logos and the Gospel of Saint John.

AMALRICIANISM.—A pantheistic heresy promulgated by Amalric of Bene, professor of logic and exegesis in the University of Paris. Extinct.

AMYRALDISTS.—A sect of Calvinists who followed Moses Amyraut in his attempt to reconcile the disputes concerning predestination and divine grace.

ANABAPTISTS.—A name most generally applied to those bodies of extreme anti-sacerdotalists which required re-baptism from those who had been baptised in infancy and who were often over-zealous in their repudiation of certain doctrines of the 16th century Church. For many years the term was seldom used except as one of opprobrium.

ANGEL DANCERS.—A small sect of vegetarians founded about 1890 by Huntsman T. Mason, who claimed to be the reincarnation of the spirit of Saint John the Baptist.

ANGELIC BROTHERS.—A community of Dutch pietists founded by George Gichtel in the 16th century. Its members held that, having attained a state of angelic purity, they should give no further thought to marriage. Extinct.

ANGLICANS.—One definition for the High Church school in the Episcopal Church.

ANNIHILATIONISTS.—The name applied to those sects which teach the absolute destruction of the wicked.

ANOMAEANS.—The extreme sect of Arians; it taught that the Son was of an essence which was not even similar to that of the Father. It existed during the 4th century.

ANSARIANS.—A sect whose membership is almost entirely restricted to a small district in Syria. As a religious belief it is a combination of Mohammedanism, paganism and something that somewhat resembles Christianity. This strange faith is said to have first been taught by Nusari, a prophet and saint who lived at Nassi, near Koufa, in the latter part of the 9th century, and his gospel included the doctrine of metempsychosis as well as that of divine unity in three personalities, the second and third being created. This sect now receives both the Old and New Testaments, the Koran and several apocryphal works as its inspired scriptures.

ANTI-MISSION BAPTISTS.—A sect which is theologically in accord with the regular Baptists but that is opposed to missions, Sunday schools and other educational and evangelistic enterprises.

ANTI-PEDABAPTISTS.—A name sometimes applied to sects that are opposed to the doctrine of infant baptism.

ANTIBURGHERS.—A name applied to one of the two factions into which the Scottish Secession Church was split in 1747. The controversy was based upon the lawfulness of a clause in the oath required to be taken by burgesses, but, while the point was fiercely contended for several years, the two factions were reunited in 1820.

APHTHARTODOCTES.—A sect which became extinct about the 9th century. It held that the body of Christ was incorruptible even before the resurrection and that his suffering of death was merely a phantasma.

APOLLINARIANS.—A sect condemned during the 4th century for having denied the proper humility of Christ.

ARIANS.—The followers of Arius, the Alexandrian priest who promulgated a widespread heresy during the 4th century. Denying the divinity of Christ and other fundamental doctrines of the Christian Church, he was condemned and Arianism was suppressed by order of the early councils. Since that time, however, the doctrines taught by Arius have been frequently revived and they still exist under other designations.

ARMENIANS.—Although the separation of the Armenian Church from the main body of Christians, which occurred at the time of the Council of Chalcedon (451 A.D.), was the result of a comparatively inconsequential misunderstanding; it has been maintained to this day, in spite of the several attempts at reconciliation.

ARMINIANIS.—A name sometimes applied to the anti-Calvinistic sects of Protestants which teach the doctrine of universal salvation.

ARTOTYRITES.—A sect existing in the early days of the Church. It admitted women both to the priesthood and the episcopate and taught the use of bread and cheese in the eucharist on the ground that it was right that man's oblations should be of the fruits of the earth and of the flocks.

ATHEISTS.—The term applied to those persons who deny the existence of God.

BAANITES.—A Paulician sect of the 8th and 9th centuries. Extinct.

BABISTS.—The followers of Mirza Ali Muhammad of Shiraz, who founded a new religious system in Persia during 1844. Described as a "Pantheistic offshoot from Mohammedanism, tintured with Gnostic, Jewish and Buddhist ideas," the high form of morality which it teaches has appealed so strongly to the Western mind that its converts in America alone during the past few years undoubtedly number several thousand. Among other doctrines Babism teaches the equality of the sexes.

BABAISTS.—The same sect as the Babists (q. v.).

BAPTISTS.—Those sects which oppose infant baptism, administering the rite only to adult persons, and then baptizing them not to make them children of God, but as a sign that they themselves have accepted Him. See BAPTISTS.

BEGUNIS.—A fanatical Russian sect which preaches and, it is feared, sometimes practises the rite of human sacrifice as a means of justification before God.

BEZPOFOFTSCHINS.—Many sects of Russian dissenters depend upon an independent ministry, rejecting the office of priest, or "pope." They are designated as Bezpoftschins.

BIBLE CHRISTIANS.—See BRYANITES in this article.

BOHEMIAN BRETHREN.—A Hussite sect which was quite numerous in Bohemia but which ceased to exist at the end of the 17th century.

BOOUDO.—The Buddhism of Korea, which differs but slightly from that of China.

BORRELISTS.—A sect of Mennonites whose worship is devoid of all external ordinances.

BOURIGNONISTS.—A sect of Quietists founded by Antoinette Bourignon, a pietist who claimed to be the subject of divine inspiration, in the 17th century. Extinct.

BRAMANISM, or HINDUISM.—This religion, which is the oldest faith that has sprung from the Aryan family, derives its name from that of its chief caste, from which alone, the priests are selected.

BRABMO-SOMAJ.—A monotheistic Hindu sect which apparently owes its origin to the contact of Brahmanism with the various anti-sacerdotal forms of Christianity represented by the missionaries.

BROAD CHURCHMEN.—A designation often applied to a school of thought in the Protestant Episcopal Church, the members of which are inclined to give considerable latitude to individual opinion in the rejection or acceptance of beliefs.

BRYANITES.—Otherwise known as "Bible Christians." A sect which is in general theological accord with Methodism, but which permits women to preach.

BUCHANITES.—The followers of Elspeth Buchan, or Simpson, a religious enthusiast in Scotland who claimed to be the woman of Revelation in whom the light of God was restored to men. Extinct.

BUDDHISM.—The reform movement which originated in India, some 2,500 years ago. It was a protest against the religious and social despotism of Brahmanism, and, while atheistic in theory, teaching that release from existence, or absorption into the infinite, is the great good to which man should look forward, it has exercised an elevating effect upon the social and moral conditions of the countries where it has been accepted. It is still the religious faith of about one-third of the human race.

CAINITES.—A fanatical Gnostic sect of the 2d century. Its members revered such personages as Cain, Easan and Judas Iscariot. Extinct.

CALENDAR BRETHREN.—A religious society, which, while once prominent, now exists only in Brunswick. It derives its name from the fact that its meetings are always held on the Kalends, or the first day of the month.

CALVINISTS.—A designation applied to those Christians, in various sects, who follow John Calvin in his opinions regarding the ministry, the sacraments and divine grace, as exploited in his doctrines of "Election" and "Particular Redemption."

CAMPBELLITES.—The followers of Rev. John McLeod Campbell, who taught the universality of the atonement and who held that Christ's death was in no sense a vicarious satisfaction of divine justice. He was condemned as a heretic by the Presbytery of Dumbarton in 1830.

CAMPBELLITES, AMERICAN.—Otherwise known as Disciples of Christ, or as Reformed Baptists. A Baptist sect founded by Rev. Thomas Campbell. Congregational in discipline it insists upon baptism by immersion as the requirement for admission to its membership. See CHRIST, DISCIPLES OF.

CATHOLIC APOSTOLIC CHURCH. See IRVINGITES.

CHRISTADELPHIANS.—Otherwise known as Christ's Brethren. A sect of modern origin which has assumed its name to distinguish it from other bodies of Christians whom it regards as apostates. Quite similar to Unitarianism in its doctrines it still insists upon baptism by immersion. See CHRISTADELPHIANS.

CHRISTIAN CATHOLIC CHURCH. See DOWIE.

CHRISTIAN CONNECTION.—A sect which accepts no earthly leaders and which denies the inspiration of all creeds. Its members are permitted to be guided entirely by individual interpretation of the Holy Bible.

CHRISTIAN ISRAELITES.—A small sect, the members of which are anticipating the immediate second-coming of Christ.

CHRISTIAN SCIENTISTS.—The followers of Mrs. Mary Baker Eddy, who, about 1866, promulgated a system of theosophic and therapeutic doctrine. Mrs. Eddy, in her book, "Science and Health," based her theories upon the Bible, teaching that as man's essential nature is spiritual and the Spirit of God, Love and Good, any moral and physical evil must be contrary to that Spirit, representing the absence of the True Spirit which was in Jesus Christ. See CHRISTIAN SCIENCE.

CHRISTIANS.—Several small sects have from time to time assumed the title "Christians," to indicate that they alone are possessed of true Christianity.

CHRIST'S BRETHREN. See CHRISTADELPHIANS.

CHRIST'S SACRUM.—A religious society founded in the 18th century to work for the reunion of all Christian bodies. Practically extinct.

CHURCH OF GOD.—Otherwise known as Winebrennerians. A small body of Baptist Christians, which accepts no authority, or creed, except that contained in the doctrines expounded by its founder, John Winebrenner. See **CHURCH OF GOD**.

CHURCH OF GOD IN JESUS CHRIST. See **ADVENTISTS**.
CHURCH OF THE NEW JERUSALEM. See **CHURCH OF THE NEW JERUSALEM**.

COGLERS.—A sect of total abstainers whose chief tenet is that its members are morally incapable of committing any sin.

COLLEGIANTS.—A sect which, founded in the 17th century, is still well represented in The Netherlands and in some parts of Germany, deriving its name from the fact that its assemblies are known as colleges. Its theological position is practically that of the Quakers, plus baptism by immersion.

COLLEGIATE CHURCH.—The corporate name of a branch of the Reformed (Dutch) Church which occupies an important position among the religious bodies of New York.

CONFUCIANISM.—Although one of the popular religions of China, Confucianism is in no sense a religious system, its only worship being what may be defined as a religious veneration of ancestors. Instead of doctrines it presents instructions as to the proper mode of life, the discrimination between virtue and vice; the duty of compliance with the law of following the dictates of the conscience, etc.

CONGREGATIONALISTS.—An evangelical sect, which derives its name from its fundamental principle in discipline, that each particular congregation is an independent body, having the right to elect or depose its pastors, settle all disputes regarding matters of faith; and exercise necessary discipline over its members without the interference of other congregations.

COPTS.—The name applied to the Jacobite Church in Egypt, which has now almost entirely supplanted the Orthodox Church.

CUMBERLAND PRESBYTERIANS.—A sect which withdrew from the Presbyterian Church in 1810 because of the refusal of that body to recognize as ministers persons who had been admitted without the usual educational preparation and who refused to subscribe to the Calvinistic doctrine of "Election." See **PRESBYTERIAN CHURCH**.

DEISTS.—Those who believe in the existence of God, but who accept few if any other of the doctrines of the Christian religion.

DEVIL WORSHIPPERS. See **SATANISTS** and **YEZEDEES** in this article.

DOMATISTS.—An early Christian sect in Africa. Its members held that they alone constituted the true church and that any offices performed by other clergy were invalid. Extinct.

DOWRYTES.—Otherwise known as "The Christian Catholic Church." A sect primitive in creed, the members of which believe in the healing of disease by prayer. It was founded about 1892 by the late John Alexander Dowie, who professed to be the reincarnation of the Prophet Elijah.

DURSI.—A fanatical sect found chiefly in the mountainous regions of Syria. Their name is derived from that of their first apostle, Ismael Darazi, or Durzi. Little is known concerning their belief, their reputation for fanaticism being based upon the blood feud which they have long maintained against their Maronite neighbors.

DUKHOBORETS.—A Russian sect which originated in the early part of the 18th century. It has been subjected to repeated persecutions both because of its religious doctrines and for the refusal of its members to abide by the laws of the country.

DUNKARDS.—Otherwise known as Brethren. An American sect of extremely primitive Baptists which was founded by a party of German emigrants in the 18th century. In addition to a dress which is peculiar to themselves, its members maintain such customs as the washing of feet and the anointing of the sick with oil. See **GERMAN BAPTIST BRETHREN**.

EBIONITES.—A sect of Judaizing Christians which became extinct about the 4th century. They recognized Christ as the Messiah, but denied his divinity and repudiated the writings of the apostles, accepting the Mosaic law.

ELCISAITES.—A Jewish Christian sect very similar in doctrine and practice to the Ebionites. Extinct.

ENCRATITES.—The name applied to those members of Early Church who refrained from marriage as well as the use of wine and flesh meat. Extinct.

ENOCHITES.—A millenarian sect in Russia. It teaches that the Prophet Enoch has already returned to earth and that his personal manifestation will be the signal for the destruction of all matter.

ENYRIANS. See **ANSARIANS** in this article.

ERASTIANS.—The followers of Thomas Erastus, who proposed several restrictions regarding the jurisdiction of the Church. Extinct.

EUCHITES.—A 4th century sect sometimes known as Berthusaists. Its members lived a life of prayer and asceticism and repudiated the sacraments and moral law. Extinct.

EUSEBIANS.—A sect of extreme Arians. Extinct.

EUSEBIANS.—The followers of Eusebius of Nicomedia, who effected the restoration of Arius in 334. Extinct.

EUSTATHIANS.—The orthodox sect in Antioch during the 4th century. Extinct.

EUTYCHIANS.—The members of a sect condemned for heresy in the 5th century. They taught that Christ was possessed only of a divine nature. Extinct.

EVANGELICAL ADVENTISTS.—The original sects of Adventism. Its particular belief is in the conscious state of the dead and, necessarily, the conscious suffering of the wicked. Like other Advent sects it is millenarian. See **ADVENTISTS**.

EVANGELICAL ASSOCIATION.—A sect whose belief is like that of the Methodists except that it rejects the doctrine of original sin. See **EVANGELICAL ASSOCIATION**.

EVANGELICALS.—A designation sometimes applied to the Low Church party in the Episcopal Church.

FETISHISM.—The lowest grade of idolatry, taking the form of a worship of some material object to which a supernatural power is ascribed.

FINE WORSHIPPERS.—A designation by which the Parsees are sometimes known.

FLAGELLANTS.—The victims of a hysterical mania which spread over almost every portion of Europe during the Middle Ages. Its devotees held that in flagellation was the only means to salvation, but their use of the scourge was finally suppressed by the ecclesiastical powers.

FLEMINGS.—Otherwise known as "Fine," or rigid Mennonites, because they profess to maintain more ancient rites and stricter principles than those followed by ordinary Mennonites. Among these ancient rites is that of feet washing.

FOISM.—The official name for the Buddhism of China. Its worship includes that of many gods which are peculiar to itself.

FRATRICELLI.—A sect which had its origin in a reformation of the Franciscan order in the 13th century. Its members devoted themselves to prayer, rejected the sacraments and held that the ideal Christian condition was one of poverty. Extinct.

FREE CHURCH OF ENGLAND.—A name which has been assumed at various times by sects which have seceded from the Church of England. They have had no affiliation, however, either in principles or practice.

FREE KIRK OF SCOTLAND.—A name assumed by that body of Presbyterians which seceded from the Established Church of Scotland in 1843. The only points in which it differs from the older body are in matters of patronage and the question of the right of the state to interfere in church affairs.

FREE WILL BAPTISTS.—A sect which withdrew from the Baptist communion in 1780, chiefly because of its rejection of the Calvinistic doctrine of election, but a much closer union between these two sects has since been effected, many churches in various parts of the country having united.

FRIENDS, SOCIETY OF. See **FRIENDS, THE RELIGIOUS SOCIETY OF**.

FRIENDS OF LIGHT.—A sect of Rationalistic Lutherans. It taught that complete intellectual freedom in religious belief could not be obtained except when individual judgment was permitted to be the sole guide of the conscience.

GALENISTS.—A Mennonite sect founded in 1664 as the Arminian branch of the Waterlands.

GLASSITES. See **SANDERMANIANS** in this article.

GNOSTICS.—The name applied to the Rationalistic sects which flourished between the 2d and the 6th centuries. They rejected the literal translation of the Scriptures, held that God was unknowable, that Christ was a superior son who had come to subdue the son of this world, and insisted that knowledge instead of faith was necessary to salvation. Extinct.

GREEK ORTHODOX CHURCH.—The name applied to the communion which since its separation from Rome has acknowledged the primacy of the patriarch of Constantinople.

GYMNOSOPHISTS.—An ascetical sect of Hindu philosophers who lived as hermits that they might better devote themselves to silent contemplation. Extinct.

HANAFITES.—The oldest of the four orthodox sects of Sunnite Mohammedans.

HARMONY SOCIETY.—A communistic religious body composed of members of the German Pietist sect, the Separatists, which emigrated to the United States in 1803 and founded a colony in Pennsylvania, the model for which was the primitive church. After removing to Indiana in 1815, they returned to Pennsylvania in 1825, when they founded the township of Economy and the new village of Harmony. Communistic in character, they hold all property in common, discourage matrimony, and look for the early second-coming of Christ. See **HARMONISTS**.

HATTEMISTS.—A sect founded in The Netherlands in the 17th century. Its members denied the expiatory sacrifice of Christ and held that sin can exist only in the imagination. Extinct.

HENRICIANS.—A sect of religious reformers that originated in Switzerland during the 12th century. Extinct.

HERACLEONITES.—A Gnostic sect of the 2d century. Extinct.

HICKSITES.—Those who followed Elias Hicks in his separation from the main body of the Society of Friends

in 1827. They deny the divinity of Christ and repudiate the doctrines of the Atonement and the Trinity.

HIGH CHURCHMEN.—Otherwise known as Ritualists. A designation applied to those members of the Episcopal Church who exalt the authority of the Church and give prominence to the sacerdotal aspect of the priestly office.

HINDUISM.—The name applied to the modern religious beliefs which have developed from Brahmanism.

HOLY GHOST AND US, SOCIETY OF THE.—Otherwise known as "The Church of the Living God." A sect which, millennial in character, teaches the cure of disease by faith and professes to follow a literal interpretation of the Scriptures.

HOLY ROLLERS.—A designation applied to a small sect because of the peculiar habits of its members who roll upon the ground during their religious ecstasies.

HOUSE OF ISRAEL.—An obscure sect of American millenarians.

HUNTINGDONIANS.—A sect of Calvinistic Methodists, congregational in policy, which was founded by Selina, Countess of Huntingdon, after her withdrawal from the Wesleyan communion.

HUNTINGTONIANS.—A sect founded by William Huntington, known as the "preaching coal-heaver," who laid great stress upon the doctrines of faith and indefectible grace. Practically extinct.

HUTCHINSONIANS, AMERICAN.—The followers of Mrs. Anne Hutchinson, who taught the Antinomian doctrines in the Massachusetts colony soon after its foundation. Extinct.

HUTCHINSONIANS, ENGLISH.—The followers of John Hutchinson, who, accepting the Bible as the source of all science and all philosophy, opposed the system of Newton and all other scientific theories that could not easily be reconciled with their belief. Extinct.

INDEPENDENT METHODISTS.—A title assumed by several independent congregations of Calvinistic Methodists.

INGHAMITES.—A religious denomination founded in England in the 18th century by Benjamin Ingham, who taught a peculiar combination of Methodism and Moravianism. Extinct.

IRVINGITES.—Otherwise known as "The Catholic and Apostolic Church." A sect founded in 1831, its doctrines being based upon the teachings of Edward Irving, who held that by a new "outpouring" of God through the Holy Ghost the prophetic and apostolic offices had been re-established. Its ritual is very elaborate.

JACOBITES.—A sect of Christians in Asia, the members of which have remained true to the Monophysite doctrines. Its churches include three patriarchates, those of Antioch, Armenia and Alexandria.

JAINS.—A non-conformist Hindu sect, the members of which believe that every object in the world, including plants and minerals, as well as men and animals, possesses souls.

JANSENISTS.—A school of thought established in the Roman Catholic Church by Cornelius Jansen during the 17th century. It has frequently been the subject of the condemnation of the ecclesiastical authorities.

JEKERS.—A name, usually a term of opprobrium, applied to those sects whose members are in the habit of indulging in violent exhibitions of religious fervor on the occasion of revivals or other special meetings.

JOACHIMITES.—A mystical sect which existed until some time in the 13th century. Its members believed that the earth was passing through the third and last period of its existence and that a new gospel would soon appear to supersede the Old and New Testaments.

JULIANISTS.—A sect in the 6th century. It held that the body of Christ was incorruptible. Extinct.

JUMPERS.—A name which was first applied to the Methodists of Wales because of their peculiar actions during times of religious frenzy.

KABBALISTS.—Those who are devoted to the Kabbala, or the theosophical or mystical philosophy of the Hebrew faith.

KABIRPANTHS.—The followers of Kabir, a Hindu reformer, who denounced idol worship and preached that the only religion was devotion to one god, irrespective of the name by which that god might be known.

KARAITES.—Otherwise known as "The Karim," or "Scripturists." A Jewish sect which adheres strictly to the Scriptures, rejecting the authority of the Kabbala as well as the Talmuda.

KILHAMITES.—The name often applies to the followers of Alexander Kilham, the founder of the "New Connection of Wesleyan Methodists."

LABADISTS.—A sect of Christian communists which existed until the middle of the 18th century. Its members upheld the doctrines of Jean de Labadie, who taught that as life was a perpetual sabbath, the observance of a particular day was unnecessary and that marriage as a holy ordinance was not valid unless both parties to it were believers, in which case the children of such unions were born without the taint of original sin.

LAMAISM.—The Buddhism of Tibet, which teaches that the soul of Buddha is always present, reincarnate in the body of the Grand Lama.

LATTER DAY SAINTS. See MORMONS.

LEONISTS. Same as WALDENSES.

LESGLIANS.—A Mohammedan sect living in the Caucasus.

LIFE AND ADVENT UNION.—A sect which is similar to regular Adventism except that it holds that the souls of the wicked are exterminated and will not be present with the saints at the day of resurrection. See ADVENTISTS.

LOLLARDS.—Otherwise known as "Bible men." The followers of Wyclif in England during the 14th century. Extinct.

LOW CHURCHMEN.—The designation applied to that branch of the Episcopal Church, the members of which strive to avoid anything savoring of sacerdotalism and whose chief regard for the ministry and the sacraments is based upon their relation to the religious life of mankind.

LUCIANISTS.—The members of a Marcionite sect which existed during the 2d century. They held that while some representation of the soul and body would appear at the resurrection the actual soul and body would not participate in that event. Extinct.

LUTHERANS.—Although there have been many changes in the various branches of the Lutheran Church since the days of Luther the doctrines which he promulgated in the 16th century are the basis for the beliefs of all the sects which bear his name and which are now represented in almost every part of the Old and New Worlds. The title is also applied to all followers of that 16th century reform movement which cost the Roman Catholic Church so large a part of the Teutonic and Scandinavian constituency. See LUTHERAN CHURCH IN AMERICA.

MACARIANS.—A monothelitic sect founded by Macarius, patriarch of Antioch, in the 7th century. Extinct.

MACEDONIANS.—A sect founded by Macedonius bishop of Constantinople, in the 4th century. Its members denied the Godhead or distinct existence of the Holy Spirit, claiming that the supposed third person in the Trinity was no more than a divine energy which God had diffused through the universe. Extinct.

MALAKANES.—A millenarian sect in Russia, the members of which reject all sacraments.

MANDEANS.—An Eastern sect that has never extended beyond Persia and Arabia. Its members are known as "Disciples of Saint John the Baptist," and, from the Christian point of view, their Christology is of a most heretical character.

MARCELLIANS.—Followers of Marcellus, bishop of Ancyra, in the 4th century. They held that the Holy Spirit was merely an impersonal agency of God. Extinct.

MARCELLINISTS.—A Gnostic sect of the 2d century. Extinct.

MARCIONITES.—An ascetic Gnostic sect of the 2d century. Its members rejected the Old Testament and denied both the incarnation and the resurrection. Extinct.

MARONITES.—The ecclesiastical name for a Syrian tribe inhabiting the slopes of Lebanon. In the early days the Maronites followed the monothelitic heresy, but, in 1445, they were reunited to the Roman communion, although they have continued to retain their own liturgical customs, just as they elect their own patriarch.

MARTINISTS.—A school of religionists, or kind of pietist freemasonry, instituted by Chevalier Saint Martin. Among other peculiar doctrines the founder taught that man is antecedent to nature, having existed in spirit, of the same essence as God Himself, prior to his existence in body.

MASSILIANS.—The members of a Semi-Pelagian school once numerous in France.

MATERIALISTS.—Those who hold that matter is the first and only principle and that mind is the derived result.

MELCHITES.—The name by which the orthodox Egyptians are distinguished from the Jacobites.

MELETIANS.—A 4th century sect, followers of Meletius, a schismatic Egyptian bishop. Extinct.

MEN, THE.—The name applied to a class of lay preachers who frequent the Scottish Highlands. They wear a distinctive dress and are in direct opposition to the Kirk in all their ministrations.

MENNONITES.—A general designation for those sects which were known as Anabaptists until the time of their reformation by Menno, in the 16th century. See MENNONITES.

METHODISTS.—A general designation for those sects which are more or less the outcome of the institution of John Wesley's confraternity, in 1739. The parent sect was known as Wesleyan Methodists, but many other important branches have been organized since that time, including the Methodist Episcopal Church, Methodist Reformed Church, Methodist Protestant Church, Union American Methodist Episcopal Church, Methodist Episcopal Church South, Congregational Methodist Church, New Congregational Church, Primitive Methodist Church, Free Methodist Church, Independent Methodist Church, Methodist Connection and various African and Zion Methodist branches, which are composed of colored persons. See METHODIST CHURCHES OF THE WORLD.

MICHAELIARNTITES.—A pietist and millenarian sect organized by Michael Hahn after his separation from the Evangelical Lutheran Church of Wurtemberg. Extinct.

THE RELIGIONS OF THE WORLD

MILLENNARIANS.—A general designation for those Christians who anticipate the early second-coming of Christ. There are many bodies of millenarians, all professing different doctrines, the more extreme asserting that the dead will finally be restored to life, including all its bodily pleasures, on earth.

MOHAMMEDANS.—The followers of the Prophet Mohammed, who began to propagate his faith in Arabia in 611. The name which was given to this religion by its founder was "Islam," one meaning of which is "to submit wholly to God and to acknowledge Him only as Lord." The entire Mohammedan faith may be briefly explained by reference to its two articles: (1) "There is no God but God," and (2) "Mohammed is His Prophet," a proposition the acceptance of which makes every doctrine of divine authority.

MOLINISTS.—There have been two sects which have borne the name of Molinists: (1) Those who agreed with Luis Molina regarding the doctrines of free will and predestination, and (2) the followers of Miguel Molinos, the Spanish mystic who taught the doctrine of the direct relationship between the soul and God. The latter were also known as Quietists. Both are extinct.

MONARCHIANS.—A designation applied to those who deny the distinction of persons in the Trinity.

MONTANISTS.—A 2d century sect, the followers of which believed in the divine and prophetic inspiration of Montanus of Phrygia. Extinct.

MORAVIANS.—Otherwise known as Moravian Brethren. A sect which occupies a theological position which is almost identically that of the Evangelical Lutheran Church. Formerly affiliated with the Taborites, it withdrew from the communion during the 15th century.

MORELTSCHIKI.—A fanatical Russian sect whose practices are said to be in keeping with its name, which means "self-immolators."

MORMONS.—Otherwise known as Latter Day Saints. A religious system organized by Joseph Smith, who claimed to have found his inspiration in a "Book of Mormon," which he had unearthed and translated. The doctrines have been further extended by later revelations, one of which, the "Celestial Law of Marriage," which was promulgated in 1852, and which authorized the practice of polygamy, having resulted in a reform movement which brought about the secession of a large body of Mormons who assumed the name of the "Reorganized Church of Jesus Christ of Latter Day Saints." See MORMONS.

MUGGLETONIANS.—An English sect founded in 1651 by Lodowick Muggleton and John Reeve, who claimed to be the two witnesses referred to in Revelations. They insisted that they were divinely inspired and taught many doctrines peculiar to themselves. Extinct.

MYSTICS.—The general designation applied to those who believe that a rapt soul may enter into union with the divine by means of ecstatic contemplation.

NAUMBERGERS.—An obscure evangelical sect which carries the simplicity of its dress to such extreme as to use hooks and eyes instead of buttons.

NAZARENES.—A 4th century sect of Jewish Christians. While observing the Mosaic ritual they accepted the divinity of Christ and looked for his early second-coming.

NECESSITARIANS.—A general designation applied to those who believe that a fixed and unchangeable law governs everything.

NESTORIANS.—The followers of Nestorius, who denied the hypostatic union of the two natures in the one person, Christ. Two sects of Nestorians, the remnants of the once-powerful denomination, still exist, one in Turkey and Persia, and the other in India.

NETOVTSCHINS.—A sect of Russian dissenters who believe that antichrist has commenced the ruin of the Church and that all holiness is gradually being extinguished.

NEW JERUSALEM CHURCH. See CHURCH OF THE NEW JERUSALEM.

NEW LIGHTS.—A designation sometimes applied to the Free Will Baptists and Separatists.

NIOBITES.—A monophysite sect which was finally absorbed into the orthodox communion. Its members held that the human nature of Christ was lost in its union with his divine nature.

NOETIANS.—The followers of Noetus, a 2d century heretic, who held that Christ was the actual embodiment of the Father and that it was the Father Himself who was born and had suffered death on the cross.

NONCONFORMISTS.—A designation sometimes applied to various sects of Protestant dissenters.

NOVATIONS.—An austere 3d century sect which was absorbed by the Mother Church before the 6th century, its differences having been chiefly in regard to matters of church discipline.

OAHPPE.—A sect of American vegetarians, extremely primitive in character. Its tenets prohibit divorce and second marriage and its members are not permitted to have recourse to law.

OLD CATHOLIC.—A movement inaugurated in Germany as a protest against certain dogmas of the Roman Catholic Church.

OLD LUTHERANS.—The name applied to those Lutherans

of Prussia who have refused to enter into affiliation with the United Evangelical Church.

OLD SCHOOL BAPTISTS.—The name assumed by a religious sect which still maintains the strict doctrines of Calvinism.

OLD TWO-SEED-IN-THE-SPIRIT PREDESTINARIANS.—A strictly Calvinistic sect of American Baptists.

OMISH CHURCH.—The name applied to a strict sect of primitive Mennonites.

OPHITES.—A Gnostic sect which held that the serpent that tempted Eve was the impersonation of divine wisdom.

OSIANDRIANS.—The followers of Oslander, a 16th century theologian who taught that the attainment of the essential righteousness of Christ was necessary to justification by faith.

PANTHEISTS.—The members of a philosophical school which teaches that God is in everything and that everything is God.

PARSEES, or PARSI.—The followers of Zoroaster, who founded the ancient religion of Media and Persia, about 1000 B.C.

PAULICIANS.—A sect founded in the 7th century, the members of which held that all matter is evil and that Christ had a purely ethereal body and suffered only in appearances. Extinct.

PECULIAR PEOPLE.—A sect which in almost every respect resembles the Dunkards.

PELAGIANS.—A sect which held that there was no original sin, but that each soul was created sinless and free. Extinct.

PEREMAYANOPTSCHINS.—A sect of Russian dissenters which requires the reordination of the clergy.

PERFECTIBILISTS.—A name applied to those who hold that absolute perfection is attainable during the present life.

PERFECTIONISTS.—The name assumed by an American sect established by John Humphrey Noyes, in 1845. In addition to teaching perfect holiness through complete reconciliation with God, its founder maintained the equality of the sexes and the community of goods.

PICARDS.—A sect suppressed in the 15th century because of alleged immoralities. They held that salvation was obtainable only through the restoration of man's primitive innocence.

PIETISTS.—A general designation applied to those who claim to be possessed of extreme piety.

PLYMOUTH BRETHREN.—A sect which holds the two doctrines of Predestinarianism and Millenarianism and which does not maintain a separate ministry.

PEMORANS.—A sect of Russian dissenters which has no separate ministry and which requires rebaptism of converts.

POPOVTSCHINS.—That branch of Russian dissenters which continues to maintain the office of priest, or "pope."

POSITIVISM.—A modern school of skepticism, founded by Auguste Comte. As a religion, Positivism is nothing less than the worship of humanity; as a philosophy, it teaches that nothing should be accepted as true unless it can be positively demonstrated.

PREDESTINARIANS.—A general designation applied to those who believe that each soul is predestined for heaven or hell from all eternity.

PRESBYTERIANS.—The name assumed by a denomination which maintains that the ministry of the Church should consist of but one order, that of presbyters, or elders. Its creed, which has been Calvinistic since the establishment of the denomination, is now, in some places, in process of alteration.

PRINCETES.—A small English sect established in 1840 by Henry James Prince, who professed that his person represented a new dispensation of the Holy Ghost by which the dispensation of Christ was to be superseded. It is now practically extinct.

PROTESTANT EPISCOPAL CHURCH.—The American representative of the Church of England, the denomination which led in the protesting reformation of the Roman Catholic Church in that country. In addition to its creeds it adopts the principles of the Thirty-nine Articles and makes use of the Book of Common Prayer. See PROTESTANT EPISCOPAL CHURCH.

PUSEYITES.—The name sometimes applied to the High Church school in the Episcopal Church, from that of Dr. Pusey, who was one of the leaders in the "Tractarian" or ritualistic movement.

PYRRHONISTS.—The designation applied to that school of extreme skepticism which denied the possibility of attaining with certainty any absolute truth.

QUAKERS.—Otherwise known as Friends, or as the Society of Friends. A sect founded by George Fox. Its members reject all sacraments, possess a mixed but not settled ministry which depends upon the inspiration of the Holy Spirit for its utterances, and refuse to participate in wars or to take oaths. They also maintain a peculiarity of dress and a simplicity of speech which is quite in keeping with their life of peace and meditation. See FRIENDS, THE RELIGIOUS SOCIETY OF.

QUIETISTS.—A designation often applied to a school of mysticism, the followers of which profess to resign them-

selves passively to what they regard as divine manifestations. The name is also applied to certain distinctive sects like the Bourignonists and Molinists.

RAPPISTS. See **HARMONISTS**.

RATIONALISTS.—Those who maintain that reason is the one test of truth in matters of religious faith and who are guided by this theory in their interpretations of the Bible.

REFORMED DUTCH CHURCH.—The Reformed Protestant Dutch Church which was instituted in the Netherlands during the 16th century. In 1561 it adopted a confession of faith, known as the Belgic Confession, which was prepared by Guido de Bres, who took for his model the Calvinistic confession of the Church of France. This body was the first Reformed Church instituted in the American colonies.

REFORMED DUTCH CHURCH, TRUE.—A sect resulting from the secession of a party led by Rev. Sol Froeligh, in 1822. They held that the Reformed Dutch Church had become erroneous in doctrine, lax in discipline and corrupt in practice. During recent years the sect has gradually dwindled away although it is still in existence.

REFORMED EPISCOPAL CHURCH.—Founded in 1873 as a church of the reformation, or as a protest against what it termed the errors in the position and practice of the Protestant Episcopal Church.

REFORMED GERMAN CHURCH.—That portion of the Protestant Church which, being unable to embrace either the teaching of Luther or of Zwingli, endorsed instead the Melancthonian compromise.

REFORMED PRESBYTERIAN CHURCH.—Otherwise known as Cameronians. A sect founded in the 17th century as a protest against what its members regarded as the "unworthy compromise" of the Established Church.

RELIEF SYNOD.—A body of Scotch dissenters whose secession was the result of their opposition to the existing system of patronage.

REMONSTRANTS.—A title applied to the Arminians for the reason that they had called their creed, adopted in 1610, "The Remonstrance."

RESTORATIONISTS.—A small sect the beliefs of which may be designated as Universalism in a modified form.

RITUALISTS.—Another designation for High Churchmen.

ROMAN CATHOLIC CHURCH.—That body of Christians who look to the Holy See for direction in spiritual things. See **CATHOLIC CHURCH**.

RUSSIAN ORTHODOX CHURCH.—The national Church of Russia. It differs in belief but slightly from that of the Roman Catholic Church, from which it separated about 1,000 years ago.

RUTHENIANS.—The members of the Ruthenian Church are converts and the descendants of converts from the Russian Church who now maintain obedience to the Pope in spite of the fact that they have never altered their ancient rites and discipline and still use the Greek liturgy, which they have translated into Old Slavonic.

SABBATARIANS.—Those who insist upon the strict observance of the Sabbath as a tenet binding upon all Christians.

SABBATIANS.—A 4th century sect the members of which adopted the Quartodeciman rule. Extinct.

SALVATION ARMY.—A quasi-military organization formed to promote the revival of religion among the masses. It was organized in England, about 1865, by William Booth, a Methodist evangelist. At that time it was known as the Christian Mission, and it retained the title until 1878, when it was changed to that of the Salvation Army. Its theological position is thoroughly evangelical.

SAMOKRISCHTCHINS.—A name which signifies "self-baptizers," and which as applied to a sect of Russian Christians indicates its theological peculiarity.

SANDEMANIANS.—A denomination founded in the 17th century by Robert Sandeman, a disciple of John Glas. Its members maintain a community of goods; abstain from blood meats and from things strangled, and participate in ome feasts and a weekly communion.

SATANISTS.—The members of a strange sect which worships and prays to Satan not only because of his present power to do evil, but on account of his future power to do good.

SCHWENCKFELDIANS.—A sect of German anti-sacramentalists founded at the time of the Reformation by Casper Schwenckfeld.

SCOTTISH BAPTISTS.—A sect which differs from other Baptists only by being more congregational in government and having a somewhat stricter form in discipline.

SCOTTISH Kirk.—The Established Presbyterian Church of Scotland, which founded on the ruins of the ancient Scottish Church, in the 16th century was adopted as the National Establishment by act of Parliament.

SECOND ADVENTISTS. See **ADVENTISTS**; also **MILLENNARIANS** in this article.

SECLARISTS.—The term Secularist is most generally applied to the members of that school of skepticism which holds that man should devote his attention only to the duties and interests of this world.

SELEUCIANS.—Followers of Seleucus, who rejected baptism by water and who taught that there would be no resurrection of the body. Extinct.

SEVENTH-DAY ADVENTISTS.—The most primitive form

of Adventism, its members practising many of the ancient Christian rites. See **ADVENTISTS**.

SEVENTH-DAY BAPTISTS.—A sect which differs from other Baptists chiefly in the observance of Saturday, or the seventh day of the week, as its day for rest and worship.

SHAFITITES.—A Mohammedan sect, one of the four branches into which the orthodox sect of Sunnites has been divided.

SHAKERS.—A sect of American millenarians founded in 1776 by Ann Lee. Although it does not impose celibacy as a necessary rule of life, married couples are not permitted to live together in its communities.

SHAKTAS.—A Hindu sect, the members of which worship the divine power under its female representation.

SHIAHA.—A Mohammedan sect which claims to be the one orthodox branch of the religion because they accept Ali, the first cousin of Mohammed, as the successor to the prophet, rejecting the other caliphs who are accepted by the Sunnites.

SHIITES.—One of the two great divisions of Mohammedanism. Its doctrines are directly contrary to those of the orthodox sect, the Sunnites.

SHINTOISM.—The state religion of Japan. It teaches the existence of both good and evil gods.

SIKHS.—A sect founded in India, about 1500, upon principles of monotheism and human brotherhood. See **SIKHS**.

SIX-PRINCIPLE BAPTISTS.—The oldest sect of American Baptists. Its doctrines are founded upon the "six principles" mentioned in the first three verses of the sixth chapter of the Epistle to the Hebrews: (1) Repentance from dead works; (2) faith toward God; (3) baptism; (4) laying on of hands; (5) resurrection of the dead, and (6) eternal judgment.

SKOPTZ.—A fanatical sect of Russians. Its members practise severe penances, including, it is said, self-mutilation.

SMARTAS.—One of the three great divisions of the Hindu religion.

SOCIETY OF FRIENDS. See **FRIENDS, THE RELIGIOUS SOCIETY OF**.

SOCINIANS.—The followers of Socinius, who denied the divinity of Christ and the atonement, who rejected the sacraments and the authority of the Scriptures, and who held that the soul of man was born pure.

SOUTHCOTTIANS.—The followers of Joanna Southcott, who professed to be the inspired woman of Revelation, who was predestined to give birth to the new Messiah. Although she died of dropsy 10 days after the date on which, as she had predicted, this event was to occur, her disciples maintained their faith in her supernatural gifts, and the sect still exists in small numbers in England.

SPIRITUALISM.—A religious body composed of those who believe that it is possible for man to hold communication with the spirits of the departed.

STAROVERTZI.—A designation applied to those who refused to participate in the ecclesiastical reforms introduced in the Russian Church in the 17th century. The name signifies the "men of the ancient faith."

SUNNITES.—The name applied to the orthodox Mohammedans who constitute the largest sect of the Moslem world. Its members accept the books of Sunna, said to be the verbal utterances of Mohammed, as well as the Koran, as the sources of doctrine. See **SUNNITES**.

SWEDENBORGIANISM.—Otherwise known as the Church of the New Jerusalem. A religious system promulgated by Emmanuel Swedenborg, who taught that the last judgment had taken place in the year 1757, when the "Old Church," or Christianity had given place to the new dispensation as represented by the "New Church" of Swedenborg. See **CHURCH OF THE NEW JERUSALEM**.

SYRIAN CHURCH.—A religious body still under obedience to the Pope. Its members continue to maintain the ancient Syriac rites, which are common alike to the Jacobites and themselves.

TABORITES.—The members of one of the most extreme parties of Hussites.

TAOISM.—The materialistic religion of China.

THEISTS.—Believers in a personal Creator and Divinity, however conceived as related to man. The term is used as contrasted with Deists; Deism being the belief in a divine principle, not a personality.

THEOSOPHISTS.—Those mystics who affirm that they are admitted to a knowledge of the mysteries of being, on the side of nature as well as upon that of religion, by means of an internal and supernatural illumination. One of the most modern applications of the word is as a designation for the followers of Mme. Blavatsky.

TRASKITES.—An early name for the Sabbatarian Puritans.

TÜBINGEN SCHOOL.—A name applied to a certain rationalistic school of philosophy, the members of which questioned the credibility, integrity and reliability of the New Testament.

ULTRAMONTANISTS.—From a Roman Catholic point of view this name is applied to those who believe that the Pope is supreme spiritual ruler over every part of the Christian Church.

UNITARIAN.—A name applied to those who deny the

association of persons in the Trinity and who hold that they in themselves only hold, in its true sense, the Unity of God.

UNITED BRETHREN.—Otherwise known as United Brethren in Christ. A sect whose present doctrinal position is quite similar to that of the Moravians. Although never officially instituted it grew out of the attempt of William Oetberlein to found a church that would unite the various Presbyterian sects as one body of Christians.

UNITED PRESBYTERIANS.—A body composed of two sects of Scotch dissenters, the Associated and the Relief synods.

UNIVERSALISTS.—Those who believe in the ultimate salvation of all mankind.

UTILITARIAN.—A designation applied to those who hold that man's actions derive their character, in a moral sense, from their consequences.

VAMAMARGIS.—The name applied to those persons who, in Hinduism, worship the female side of the dual nature of Vishnu.

VOLUNTEERS OF AMERICA.—An offshoot from the Salvation Army resulting from a misunderstanding between the leaders of the two bodies. As in the Salvation Army both sexes participate in its meetings, and, like the older body, while it has no formulated creed, it is thoroughly evangelical.

WAHABIS.—Followers of Abd-el-Wahhab, a Mohammedan reformer of the 18th century. They strenuously oppose all practices not absolutely sanctioned by the Koran.

WALDENSIANS.—A reforming body of Christians, the members of which participated in the Reformation. A Waldensian church now existent in Italy numbers more than 20,000 members.

WATERLANDERS.—A sect of Mennonites, similar in doctrine but less rigid in discipline than the main body.

WILBURITES.—A branch of the Society of Friends who followed John Wilbur in his protests against the actions of the Society in abandoning its original principles.

WILKINSONIANS.—A 19th century American sect the members of which accepted the statements of Jemima Wilkinson, who asserted that she was divinely inspired, having been raised from the dead.

YERESIDES.—An ancient sect of unknown origin. Its members form a tribe of individual nationality located in the neighborhood of Mosul. They not only believe in God but also in Satan, whom they recognize as the chief of the angelic hosts. Admitting that he is suffering punishment now, they believe that he will eventually be restored to his originally high station. As the result, like the Satanists, they believe that it is right for man to pray to him.

ZANZALIAN.—A designation applied to the Jacobites of the East.

ZOARITES.—The name applied to a sect of American Letherans.

ZOHARITES.—A modern Jewish sect which takes its name from the Kabbalistic book of Zohar, which is held in great veneration.

ZOROASTRIANS. See PARSEES.

JOHN R. MEADER.

RELIGIOUS SOCIETIES. See ORDERS, RELIGIOUS.

RELIGIOUS SYMBOLISM. Wolfgang Menzel (1854) wrote "The picture is holy, same as the Word. The Savior himself spoke pictorially. The picture is as powerful as the word and more penetrating than words. The world was more pious while Christian symbolism was in vogue; laymen and priests were better trusted as long as everyone understood the pictures with which Art decorated the Church.

The world was more pious while it knew which symbol belonged to each season, yes, to each day of the year and that connected with the name of his Patron; while they yet recognized the symbolism of natural phenomena every season, and even that of the animals, plants and stones, as the signature of the Holy One in all Creation." We can call religious symbolism (when inspired) revealed or interpretative religion, or, as Hugo of Saint Victor (who developed Christian symbolism so greatly) says: "A symbol is the comparison of the visible forms for the showing forth of the invisible." Faced by the powers of the elements, fire, water, earth, lightning, etc., it soon became the natural instinct that primitive man should revere, fear and worship these ac-

tive (live) elements as conscious entities and that nature should take on in the primal brain a nomenclature easiest defined in symbol form. Hence the earliest religion and the earliest symbolism may be reasonably considered as one and the same thought-development of man. All through the evolution of the religious cults from time immemorial we will find the worship of the sun and light up to the present day in some form, open or occult. To the primitive man the warmth and productive power in nature of the sun's rays has been looked upon as a beneficent agent; and light, which dissipates the hidden dangers of night or darkness, has naturally ever been held in human regard as a friend and defender of humanity against evil. The primary consideration of light brings flame to recognition, and we learn that the ancient Persians (as well as modern Parsees) revered flame as son of Ormuzd; in Rome flame was kept pure by the pure daughters (vestals) of the leading families; in Israel the Jews kept watch over it to dispel darkness and the inherent evil spirits. Fire was the Assyrian as well as the Germanic test of purity of those accused of evil; fire appealed as purifying agent on the sacrificial altar since and probably during prehistoric times. For the candles on our altars are but a continuation of those displayed in the seven-branched candlestick in King Solomon's temple. The altar, the Latin *altare* (from *alte*, high) was any kind of an elevation on which to sacrifice, and the hill or mountain summit was preferred on which to erect it. Nearest to heaven, the mountain height has always been a revered symbol the world over, whether it be Mount Olympus of the Greeks or Fuji Yama of the Japanese, while the Christian devotee selects Mount Athos and other heights on which to live in prayer, and the sacred character of Mount Lebanon comes up prominently to mind.

The source of origin of religious symbolism can be definitely placed in the Orient, the birthplace of all occultism, for the primal elements of occultism are due to the study of the cosmic laws, the world's circumambient physical and spiritual powers and the part man could take in their control. The natural development and progress in such study brought the visible universe into its realm, and the planets found their place in the curriculum. Astrology gave the laws of astral motion, their cause and their power over the human race. Closer investigation evolved the science of mathematics and geometry—always as corollary and indivisible part of cosmic philosophy with symbolism as a large portion of its language. The science of medicine was an outgrowth from the master mind of Aristotle and such followers as Galen, Ibn Sina, Paracelsus, etc. Diagnosis included the functional powers of the sun, moon and planets, and idol worship of the untrained mind of the pagan was an act of gross materialism and misunderstanding of the occult purpose of symbolism as divine interpretation.

Harking back to the first stages of occultism and knowledge we get to Buddhist symbolism with its wheel, bowl, yellow robe, etc. Chinese history tells us how early the heavenly bodies received the attention of scholars and how the

knowledge brought into practice hidden powers of man. Then westward came the initiated and taught their disciples the mystic religion. The Chaldeans transmitted the teachings to the Egyptians. Greeks and Romans adapted their religious tenets to the Oriental pantheology and philosophy. Early Occidental masters of symbolism were Thales of Miletus (6th century B.C.), the founder of the Ionic sect of philosophers; Anaxagoras, Archelaus, master of Socrates, etc. The Jews soon absorbed the study of astrology with its planetary significance and zodiacal mystic rulings, the symbolic value of numbers (*Kabala*), etc. As an Eastern people they were naturally early imbued with a symbolic system, and the Mosaic plan frequently discloses the fact in the Old Testament, but we must remember the Egyptians (under whom the Jews had dwelt for so many years) were, in their cult, symbolists. The cult of Judaism has been said to have been built on a monotheistic and ethical basis; not like others, on natural religion and on physical and cosmic hypotheses. A learned Jewish rabbi (Samson Hirsch) declares that the purpose of Biblical symbols is not to veil the mind or to lay down secrets that are puzzles to be elucidated, as is the case with other religions, but, on the contrary, to make plainer the inner meaning in the rendering of which the meaning is mostly declared in words added to the expression. Of such symbols might be mentioned the rainbow, symbol of the pact between God and man; innumerable stars, symbol of the promised riches of Israel; stone and ladder of Jacob's dream; prohibition of eating the hip sinew, in everlasting memory of the struggle with God; the commandment to take off the shoes; the blood of the Paschal lamb; shearing of the Levites' head; washing and bathing rites, anointment, laying on of hands, etc. For in their liturgical ritual, as with those of former and later cults, the sacrifice of burnt offering on the altar has always been symbolic of self-abnegation; the burning of incense, symbol of devout prayer reaching to heaven, and so on. With their rigorous sect of Essenes we can recognize, in their peculiar ritual of apparent worship of the rising sun, a physical expression of symbolic reverence, for they seem to have considered the Torah as entirely symbolic in all its text.

In the claim, by some few, that John the Baptist was an Essene, we come to the early Christians and the Gnostics. Pythagoras (6th century B.C.), with a knowledge gained (according to ancient claims) by years of actual residence and deep study among the Egyptians, Phœnicians, Chaldeans, Jews, Arabians, Gallic Druids, Persian Magi and Indian Brahmins, founded at Crotona a religious brotherhood for the reformation of society, besides the study of philosophy. The science of numbers (mathematics and astronomy) was the basis of theoretical teaching developing into numerical symbolism and the displaying of dots as units in symmetrical patterns (as on our dice and dominoes), each pattern group becoming a symbolic unit and thereby becoming the essence of cosmic substance and symbols of such. Later the philosophy of Aristotle (4th century B.C.) with its ethics gave much impulse to the cults, and out of the teachings of these great Greek master minds, with such links in the

propaganda of mystics as Basilides, Marcion, Valentine, Heracleon, Ptolymeus, Apelles, etc., flourished gnosticism. Thus we get such sects as Ophites, Cainites, Sethians, etc. Thus we have in the first three centuries or more of the Christian era a symbolic cult supposed to cover the entire knowledge of religious sublime principles. In 325 A.D. the religious usage of symbolism was interdicted, but Byzantine churches followed a symbolic ritual containing much of the ancient Oriental mystic wisdom. The symbolism of the Moslem doctrines and architecture has been claimed as being taught to Mohammed by his Jewish secretary, who in turn gained initiation from the Aristotelian school. The cult of Sufism, with its deep occult symbolic learning, is found practised by its adherents in the land of the Moslem. The symbols of the pagan and those of the early Christian Church, as Harnack says, "were never mere signs, but always embodied a mystery." Hence water may be a symbol of cleansing power but the priestly blessing of the water incorporates the mystic value into the water; the bread and the wine are symbols of the Flesh and Blood, but the ritualistic sanctification produced the embodied Eucharist. Great teachers of the Christian symbolism were Hugo of Saint Victor (12th century), Durandus (13th century), etc. Much of the symbolic ritual of the Christian Church in Europe was brought from the Orient by the Crusaders, who imbibed their knowledge from Jew, Moslem and other sects that they encountered. And the persecution of the Knights Templar, early in the 14th century, for idolatry was based on rumors of their Oriental symbolic ritual held in mystic secrecy, no doubt, while the real incentive was jealousy of their power and the desire to grasp their \$30,000,000 annual income derived from some 9,000 rich estates. Included in the ritual and architecture of the Roman as well as the Greek Catholic Church are most of the Oriental occult branches of symbolism, often deviating in form or interpretation. Thus we find a very thorough system of the symbolism of numbers, of colors, of flowers, of animal representation of the Evangelists (Luke as lion, John as eagle, etc.). The priestly vestments are given symbolic form, even the instruments of ritual, as the crozier (taken from the pagan *baculus*, badge of the cynic philosophers) of episcopal office. But restricted space forbids discussion of symbols and their interpretation in this article dedicated to the history of religious symbolism. More information on several symbols will be found under titles SYMBOLISM, DOVE, DOLPHIN, DRAGON, EAGLE, COLORS, LAMB, LION, DOG, HEART, DEVIL, ROSE, VINE, etc.

RELIQUARY CROSSES. See **CROSSES** AND **CRUCIFIXES**.

RELIQUES OF ANCIENT ENGLISH POETRY, an anthology of old English ballads and other verse first published in 1765 by Rev. Thomas Percy (q.v.), vicar of Easton Mauduit, Northamptonshire, who later became bishop of Dromore, Ireland. During a visit at the house of his friend Humphrey Pitt at Shifnal, Shropshire, he rescued from the hands of a housemaid, who was about to use it to light a fire, an early 17th century folio manuscript, which had been "lying dirty on the floor under a bureau in the parlour." At the suggestion of William Shenstone he made it the basis of the collection of English ballads, revised and edited in the best taste, which became famous as 'Reliques of Ancient English Poetry.' This anthology has been called "the bible of the Romantic movement." Breathing the primal emotions of folk-poetry it created an entire change in the poetic spirit of the age and in a rebound from classical to human elements gave a more natural and virile tone to English verse which found its best exemplification later, in the ballad literature of Scott, Campbell and Coleridge, its influence also extending to German literature. Named in honor of Bishop Percy, the Percy Society (1840-52) was founded for the purpose of publishing old English poetry, by a group of scholars including Alexander Dyce, Halliwell Phillips, John Payne Collier and Thomas Wright. Edited in complete form by Hales, J. W., and Furnivall, F. J., the original 'Folio Manuscript' appeared in 1867-68. Besides the early editions of the 'Reliques,' including the 4th edition by the bishop's nephew, Thomas Percy (1768-1808), several editions have appeared. Of late date are those of Wheatley, H. B. (London 1891;

New York 1910); and the edition of 'Everyman's Library' (New York 1906).

REMAINDER is defined in law as an estate which commences after the determination of another estate in the same property, which has previously been limited by the same conveyance. A remainder becomes vested whenever the preceding estate is limited so as to determine on an event which must certainly happen. It is the present right of one to the future enjoyment of an estate, which right takes effect on the determination of the preceding estate. Contingent estates usually give rise to considerable doubt. The intention expressed in the instrument by which the contingent estate is created governs. Contingent remainders are defined by statute in some States. A simple exposition of the legal character of the term is: If a man in unrestricted possession of lands grants them to A for a specified period, and, after the end of that period, grants them to B and his heirs forever, A is the tenant for the period, with remainder or reversion to B.

REMBANG, rêm-bāng', Java, a seaport and the capital of a residency of the same name, on the north coast, west of the river Rembang, and 60 miles west-northwest of Samarang. Its well-protected harbor is one of the best in the island. It has a good trade in ship-timber, earthenware, paper, gold and silver work and in shipbuilding and near it are valuable salt-pans. The town contains a Protestant church, government school and an institute for girls. Pop. about 15,000.

REMBRANDT, rêm-brānt or -brānt (full name written REMBRANDT HARMENSZ VAN RIJN or RYN), Dutch painter and etcher: b. Leyden, 15 July 1607; d. Amsterdam, 8 Oct. 1669. He was the son of a miller settled in Leyden; and an early shown disposition toward the life of an artist caused him to be taken from the Latin School at an early age and put into the studio of a Leyden artist who took pupils. In 1622 he was sent to a studio in Amsterdam. In 1623 he seems to have been working as an artist and there is a signed and dated picture of 'Saint Paul in Prison' in the Stuttgart Gallery, which is his earliest piece with an ascertained date. By 1630 he was settled in Amsterdam and in 1634 married Saskia van Ulenburgh, who lived with him only eight years, leaving one son, Titus. Saskia had property; and her death caused confusion in Rembrandt's affairs because of her will leaving all of this property to Titus, with only a life interest to her husband, while in the meantime Rembrandt's affairs had been in a bad condition. In 1656 he was finally sold out as a bankrupt. It is not perfectly known why the very prosperous painter who, in his early manhood, had a great deal of work to do as a portrait painter (always a profitable branch of the art), and whose etchings sold remarkably well, should have become so straightened in his circumstances. It is known that he bought very freely, surrounding himself with works of art of all kinds, of which he was a constant and diligent student and by means of which he gave himself that knowledge of the world which he did not obtain from travel, as it appears that he never crossed the frontiers of the United Provinces. It is also asserted that a certain change in popular taste left him at one side while it followed men whom we now deem

greatly his inferiors in artistic power. He had many pupils and many assistants and even the interruptions caused by death and by loss of fortune do not seem to have checked the great production of his work, for between the time of his bankruptcy and the time of his death, 13 years later, he was as busily engaged and his work was fully as important as at any former time. The mention of a few works of art with their dates in the course of this article illustrates this fact sufficiently well.

At a very early date Rembrandt's style as a painter was fixed. It is extremely original, founded on the work of no other artist of any school, based upon a strong perception of the beauty and value of pure light and shade in nature and in art. In one sense he was a great colorist, namely in that he conceived a painting as strictly the result of a disposition and combination of the hues and tints, treating all his work with as complete a color-scheme as that used by the great Venetians. There is this peculiarity, however, that Rembrandt's coloring is sombre and reaches its highest achievement in combinations of browns and grays with but few passages of primary color or of those hues which approximate to primary color. A blue sash may appear in a portrait and its effect of pure, bright color may be led up to and assisted by the glimmer of steel and the warm yellowish-brown of a buff coat; but as a general thing these effects are not his happiest achievements as we see the pictures now, and those are the most delightful to us in which he departs the least from his accustomed gravity of tone. There is a certain disappearing of the subject in blackness which is very disagreeable to many lovers of painting; and it is hard to form a conception of how far this had been the result of time producing changes in the pigments. Meanwhile the effect of a brilliantly modeled head coming to light from a profoundly gloomy background and helped by the painting of costume similarly relieved by light colors upon darkness, is very pleasing to many students; and apart from his obviously surpassing ability, Rembrandt is a delightful painter to many ardent lovers of the art of painting. To painters by profession Rembrandt must always be one of the men whose work commands the highest respect.

His power of characterization is not confined to painting and his small etchings drawn upon copper in a few straggling lines have as much of it, according to their subject, as the largest pictures. This power of characterization lifts him almost out of the category of the painters of his period. When he has character to express, either of an individual or of a race of men, he does it with a touch and an evidence of thought entirely his own. It may sometimes take a disagreeable, even an ignominious appearance and his drawing in a given case may not be dignified or refined or even truthful; while yet the significance of the statement he wishes to make remains uniformly distinct and positive.

Among his most important paintings are the 'Saint Paul in Prison,' in the Stuttgart Gallery, signed and dated 1627; the portrait of a man at Windsor Castle, signed and dated 1631; the portrait of his brother in the Berlin Museum, that of himself in Buckingham Palace and that of an old woman in the Hermitage collec-

tion near Petrograd; 'The Supper at Emmaus,' in the Louvre; and 'The Lesson in Anatomy,' at The Hague. There are two magnificent portrait groups, one of his middle life and one of his more advanced age; 'The Night Watch,' in the Amsterdam Museum, signed and dated 1642 and 'The Syndics of the Clothmakers' Company,' in the Amsterdam Museum, signed and dated 1661.

Of his etchings the number is so very great and the enthusiasm which they have excited among great classes of collectors and students during the 19th century is so intense, that it is very hard to name even a few characteristic specimens. The prices which they fetch at auction or at private sale are enormous (several thousands of dollars in many cases), though price is not always proportionate to merit, as rarity has much to do with this detail. Thus the famous 'Three Trees' (1643), of which a fine copy is worth as much money as a large oil painting by a modern artist and the wonderful portrait of the 'Burgomaster Six' are not necessarily as much better than other and less costly prints as their price would indicate. Their faultless work, however, is the main consideration and the portrait of Six must always be of extreme value when in fine condition, because the closely worked etching has caused the plate to suffer from use—there can never have been more than 40 or 50 impressions of great brilliancy. During his life and during the 18th century the so-called Hundred Guilder print, 'Christ Healing the Sick,' was the most famous; and since that time the etching, slight and but little worked over, 'The Death of the Virgin' (1639), is one of the most admired by artists of all Rembrandt's work in black and white; the wonderful portrait of the 'Goldweigher' (1639), that of the preacher Uijtenbogaert (1635), the famous Dr. Faustus, dated 1648, and several of the landscapes, especially the 'Cottage with the Great Tree,' and the magnificent 'Omval' dated 1645, are all etchings which are unsurpassable even among Rembrandt's own works.

The most complete book on Rembrandt, that of C. Vosmaer, 'Rembrandt, sa vie et ses œuvres' (1877), has furnished most writers since that time with their facts. A more recent work of great extent and thoroughness is that by Emile Michel, translated into English as 'Rembrandt, his Life, his Work, his Time' (London 1894). This book is elaborately illustrated. Small biographies by Knackfuss (1899), Malcolm Bell (London 1899), Neumann (1900), some of them well imagined, are contained in the different series of Artists' Lives. The etchings form a continual study and besides the famous work of Bartsch (1797), which is continually referred to, there have been works by Charles Blanc (1880) and Dutuit. The best recent works on the etchings are that by Rovinski (3 vols., Saint Petersburg 1890) and that by Hameston (London 1904). His complete etched work has been reproduced in admirable photogravure by Armand-Durand. The English etcher and student of etchings, Sir Francis Seymour Haden, has published a small book on Rembrandt's etchings, 'The Etched Work of Rembrandt' (1879-80), in which there is a careful investigation of the authenticity of some which may be thought to be by students or imitators. Consult also Bode, Wilhelm, 'Œuvre de

From the original painting by himself

HARMENSZ VAN RIJN REMBRANDT

Rembrandt' (8 vols., Paris 1897), with reproductions of all paintings; Blanc, A. A. P. C., 'L'Œuvre complet de Rembrandt, décrit et commenté' (2 vols., Paris 1861); La Farge, John, in 'Great Masters' (New York 1903); Michel, F. E., 'Rembrandt Harmensz van Rijn: A Memorial of his Tercentenary' (New York 1907); Hare, T. L., 'Three Great Portrait Painters' (ib. 1909); Holmes, C. J., 'Notes on the Art of Rembrandt' (London 1911); de Groot, C. Hofstede, 'Die Urkunden über Rembrandt' (The Hague 1906).

REMEDIOS, ră-mă'thê-ôs, or **SAN JUAN DE LOS REMEDIOS**, sãn hoo-ãn' dè lôs ră-mă'thê-ôs, Cuba, town, Santa Clara province, 32 miles east of the town of Santa Clara. It is four miles from the north coast, but is connected with its port, Caibarien, by rail, and also with the important towns of the island to the west. It is in a fertile region and carries on a good trade. Pop. 21,573.

REMENSNYDER, rêm'en-sn' 'dér, Junius Benjamin, American Lutheran clergyman: b. Staunton, Va., 24 Feb. 1843. He was graduated from Pennsylvania College, Gettysburg, in 1861 and from its theological department in 1865. He served in the Union army in 1862-63, was ordained in 1865 and held important pastorates at Philadelphia, Savannah and New York, and originated the movement which resulted in the adoption of a common service ritual in all American Lutheran churches, and became president of the General Synod of Evangelical Lutheran churches in the United States in 1911. He published 'Heavenward' (1874); 'Doom Eternal' (1880); 'Work and Personality of Luther' (1884); 'Six Days of Creation' (1886); 'Lutheran Manual' (1892); 'The Atonement and Modern Thought' (1905); 'Mysticism' (1908); 'The Post-Apostolic Age and Current Religious Problems' (1910); 'Eucken and the Problem of Life' (1913); 'What the World Owes Luther' (1917).

REMENYI, rê-mân-yê, Edouard, Hungarian violinist: b. Heves, 1830; d. San Francisco, Cal., 15 May 1898. He studied violin at Vienna under Joseph Böhm. For his part in the insurrection against Austria in 1848 he was obliged to flee from Hungary. He came to the United States in 1849, but returned to Europe a few years later and in 1854 was appointed solo violinist to Queen Victoria. He returned to Hungary in 1860 under the amnesty, attained great fame and was appointed solo violinist to the emperor of Austria. In 1865 he began a professional tour of Europe; in 1878 returned to the United States, where he spent much time until his death. He made a second concert tour around the world, begun in 1886, and a tour in Canada in 1891-92. He possessed a high technical mastery of his instrument.

REMIGIUS, rê-mij'ûs, Saint, the great apostle of the French nation: b. Laon, Picardy, 438; d. Rheims, 13 Jan. 533. He was appointed bishop of Rheims when only 21 years old. He it was who baptized Clovis, the founder of the French monarchy, who had been converted to Christianity chiefly through the influence of his queen, Clothilde. The ceremony took place amid imposing surroundings on Christmas Day, 496. Through the example of the king and the untiring exertions of Remigius almost the

whole of Gaul was Christianized in the lifetime of the latter. Consult Migne, 'Patrologia Latina,' Vol. LXV (which contains some of the bishop's letters); Aubert, 'Vie de Saint Remi' (1849). Other letters are preserved in the 'Bibliotheca Patrum,' and two documents, entitled 'Testamenta,' the genuineness of which has never been fully established.

REMINGTON, Frederic, American artist and author: b. Canton, N. Y., 4 Oct. 1861; d. Ridgefield, Conn., 26 Dec. 1909. He studied at Yale Art School and the Art Students' League, New York, and later went west where, as cowboy and stockman on a ranch, he gathered the material that made him a success in scenes of frontier life. He contributed to the leading magazines and periodicals scenes of Western military and Indian life, and also events of the Cuban War of 1897-98. Few illustrators have drawn the horse with so much character and life-likeness. He produced several sculptures, such as 'The Broncho Buster' and 'The Wounded Bunkie.' As author and illustrator he produced 'Pony Tracks' (1895); 'Crooked Trails' (1898); 'Frontier Sketches'; 'John Ermine of the Yellowstone' (1902); 'The Way of an Indian' (1906). As artist and illustrator he produced 'An Impression from the Pony War Dance'; 'The Last Lull in the Fight'; 'The Advancer, or the Military Sacrifice'; 'The Arrival of the Courier'; 'A Buck Jumper,' etc.

REMINGTON, Joseph Price, American pharmacologist: b. Philadelphia, Pa., 26 March 1847; d. 1 Jan. 1918. He was graduated from the Philadelphia College of Pharmacy in 1866, was professor there from 1874, dean from 1893, and in 1877-1915 was director of the laboratory. He became a member of the revision committee of the United States Pharmacopoeia in 1880, and since 1901 has been chairman of the committee. He edited the 'United States Dispensatory' (1883-1909); 'Lippincott's Medical Dictionary' (1897); 'United States Pharmacopoeia' (1890, 1906, 1913). He wrote 'Practice of Pharmacy' (1886).

REMINGTON, Philo, American inventor: b. Litchfield, N. Y., 31 Oct. 1816; d. Silver Springs, Fla., 5 April 1889. He entered the small-arms factory of his father at Ilion, N. Y., and for 25 years was superintendent of the mechanical department. The perfecting of the Remington breech-loading rifles and of the Remington typewriter was mainly due to him. In 1886 he withdrew into private life and in that year Wyckoff, Seamans and Benedict bought out the Remington interest in the typewriter, and an assignment having been made, took charge of the Ilion plant. In 1888 the main plant passed to Hartley and Graham, who operated it as the Remington Arms Company.

REMINGTON RIFLE. See **SMALL ARMS**.

REMITTENT FEVER. See **JUNGLE FEVER**; **MALARIA**.

REMONSTRANTS, those members of the Reformed Church in Holland who, in the year 1609, after the death of Jacobus Arminius, continued to adhere to his doctrines, and in 1610 presented to the states of Holland a remonstrance in which they defend the grounds of their dissent from the official creeds of the Reformed Church; thereafter they were styled

Remonstrants, and they are still represented in Holland by a small but scholarly and liberal sect. See ARMINIANISM; RELIGIOUS SECTS.

REMORA, or SUCKING-FISH, a popular name for any species of the family *Echineididae* and order *Discocephali*. It is about eight inches long and common in the Mediterranean. The top of the head is provided with a peculiar sucking disc, a modification of the spinous dorsal fin, composed of a series of plates arranged transversely, by means of which they attach themselves to moving objects and thus supplement their powers of locomotion. On the coast of Zanzibar and elsewhere they are used in catching other fishes and turtles, the remora being secured by a line fixed to the tail, and being sent in pursuit of the turtles, etc., to which it attaches itself by means of its sucker. The ancients believed in the remora's power of arresting and detaining ships in full sail through their suction powers; and Antony's galley at the battle of Actium was said to have been fixed by a remora, which defied the efforts of several hundreds of men to free the vessel.

The remoras are a group of oceanic fishes occupying a rather isolated position among the spiny-rayed *Teleostomi*. Five genera and eight species have been recorded from North American waters. Some of them appear to confine their attentions to particular species of large fishes, as the spear-fish, dolphins, etc.; others are less particular. The common species on the Atlantic Coast of the United States are the shark-sucker (*Echeneis naucrates*), very frequently found adhering to large sharks as well as to other fishes; *Remora brachyptera*, the sword-fish remora; and *Remora remora*, a species widely distributed in warm seas. They are not utilized for food nor for any other purpose in this country.

REMSCHIED, rēm'shīt, Prussia, a noted manufacturing town, Rhine province, 1,110 feet above sea-level, 18 miles east-southeast of Düsseldorf. It is a town of much antiquity; originally a villa, it had a church as early as 1189, and by 1580 it contained several iron foundries, where pig-iron was worked into bars by hand. It has since maintained its importance as an industrial centre, producing various kinds of iron ware and especially high-grade cutlery and tools. Pop. 72,159.

REMSEN, Ira, American chemist and educator: b. New York, 10 Feb. 1846. He studied at the College of the City of New York, was graduated in 1867 from the medical department of Columbia, pursued chemical courses at Munich and Göttingen, and in 1870-72 was assistant to Prof. Rudolph Fittig in the chemical laboratory of the University of Tübingen. In 1872-76 he was professor of chemistry and physics in Williams College, and in 1876, upon the organization of the Johns Hopkins University, was made professor of chemistry in the new institution. He formed its chemical department and continued to direct the numerous researches of the Johns Hopkins laboratory, the facilities of which are not excelled in the United States. Despite the large amount of executive work devolving upon him in connection with his chair, he found opportunity for considerable original investigation, including that in connection with the oxidation of aromatic substitution products, the sulphides, double halides and the

decomposition of diazo compounds by alcohol. In 1881 he made a study for the city council of a peculiar condition of Boston water, which he found due to a growth of fresh-water sponge in one of the artificial lakes from which the supply was derived. He also conducted for the National Board of Health special researches in various subjects, among them 'Organic Matter in the Air' and 'The Contamination of Air in Rooms Heated by Hot-Air Furnaces or by Cast-Iron Stoves.' He was made vice-president of the university and frequently, in the absence of the president, Dr. Daniel Coit Gilman (q.v.), acted as president. In June 1901 he was chosen president upon the resignation of Dr. Gilman and served as such till 1912, becoming president and professor emeritus in 1913. In 1873 he was elected to the American Association, in 1875 made Fellow, and in 1879 president of the chemical section, and in 1902 president of the association. He became a member of the National Academy of Sciences in 1882, and was at one time president of the American Chemical Society. He founded in 1879 and has since edited the *American Chemical Journal*. Among his textbooks are 'The Principles of Theoretical Chemistry' (1877); 'Introduction to the Study of the Compounds of Carbon, or Organic Chemistry' (1885); 'Introduction to the Study of Chemistry' (1887); 'The Elements of Chemistry' (1888); 'A Laboratory Manual' (1889); and 'Chemical Experiments' (1895).

REMUS, rēmūs, in the fabulous history of Rome, the twin brother of the founder of the city, Romulus, who in a quarrel slew him. According to the legend Romulus and Remus were the twin sons of Mars and Rhea Silvia, who was a daughter of Numitor, king of Alba. Amulius dethroned Numitor and pronounced death on the twins, but the latter were providentially saved, and when they grew up and were informed of the secret of their birth they killed Amulius, restored Numitor and founded the city of Rome. Remus was punished with death for jumping, in derision, over the wall of the new city.

REMUS, Uncle, a well-known negro character invented by Joel Chandler Harris (q.v.) and introduced to his readers in 'Uncle Remus: His Songs and Sayings' (1880). Uncle Remus, an aged plantation African, is used as the mouth-piece of quaint folk-lore tales current among the blacks of the South and detailing in picturesque and amusing fashion the adventures of Br'er Rabbit, Br'er Fox and other animals. The stories, interlarded with considerable homely philosophy, were gathered with much care by the author and awakened among students an interest in that domain of the beast fable.

RÉMUSAT, ră-mü-ză, Charles François Marie, COMTE DE, French politician and man of letters, son of the Comtesse de Rémusat (q.v.): b. Paris, 14 March 1797; d. there, 6 Jun 1875. He was educated at the Lycée Napoleon and entered life as a journalist and lawyer. He was a member of the Chamber of Deputies 1830-48, and in 1848-49 of the constituent legislative assemblies, in which he voted with the friends of order. From March to October 1840 he was Minister of the Interior, and in 1871-73 Minister of Foreign Affairs. He began

public life as a Liberal, but ended it as a Conservative. During the Second Empire he lived in retirement, devoting himself chiefly to literary pursuits. His works include 'De la Procédure par Juges en Matière Criminelle' (1820); 'Essais de Philosophie' (1842); 'Abelard' (1845); 'De la Philosophie Allemande' (1845); 'L'Angleterre au XVIII^e Siècle' (1856); 'Critiques et Etudes Littéraires: Ou, Passé et Présent' (1857); 'Bacon' (1857); 'Politique Libérale: ou, Fragments pour servir à la Défense de la Révolution Française' (1860); 'De la Théologie Naturelle en France et Angleterre' (1864); 'Lord Herbert of Cherbury' (1874); 'Histoire de la Philosophie en Angleterre depuis Bacon jusqu'à Locke' (1875), and numerous contributions to the *Revue des Deux Mondes*.

RÉMUSAT, Claire Elizabeth Jeanne Gravier de Vergennes, COMTESSE DE: b. Paris, 5 Jan. 1780; d. 16 Dec. 1821. She was married to Comte Auguste Laurent de Rémusat, Napoleon's chamberlain, and became an intimate friend and lady-in-waiting of Josephine; thus her position made her thoroughly acquainted with the life of Napoleon's court. Her 'Essai sur l'Education des Femmes,' published 1824, received an academic *couronne*, and her 'Mémoires,' published in 1879-80, are particularly valuable for the light they throw on the court of the First Empire.

RÉMUSAT, Jean Pierre Abel, French Orientalist: b. Paris, 5 Sept. 1788; d. there, 5 June 1832. He devoted himself to the study of Oriental languages, particularly Chinese, while pursuing a course in medicine, and in 1811 published 'Essai sur la Langue et la Littérature chinoises.' He received his degree as a physician in 1814 and entered one of the military hospitals, but in that year accepted the chair of Chinese which had been established for him by the Abbé Montesquieu at the Collège de France. He was admitted to the Academy of Inscriptions in 1816; in 1818, after Visconti's death, became editor of the *Journal des Savants*, and in 1822 he founded the Société Asiatique in Paris. His works include 'Livre des Récompenses et des Peines' (1816); 'L'invariable Milieu of Tsz-tse' (1817); 'Recherches sur les Langues Tartares' (1820); 'Eléments de la Grammaire chinoise' (1822); 'Mémoire sur la Vie et les Opinions de Lao-tse' (1823); 'Recherches sur l'Origine et la Formation de l'Ecriture Chinoise' (1827), etc. Consult Silvestre de Sacy, 'Notice sur la Vie et les Ouvrages de Rémusat' (1834).

REMY, rä'mī, Alfred, American philologist: b. Elberfeld, Germany, 16 March 1870. He came to the United States when 12 years of age and was graduated at the College of the City of New York in 1890. He studied the theory of music and piano under B. O. Klein in 1890-96; was musical critic for *Vogue* in 1895-97, and musical editor of *The Looker-On* during the same period. He was lecturer on the history of music at the New York College of Music in 1896-98; professor of modern languages at the Commercial High School, Brooklyn, in 1898-1911, and since 1911 has been instructor in that branch at the Commercial High School, New York. Author of 'Alarcón's Novelas Cortas Escogidas' (1905); 'Spanish Prose Composition' (1908); joint

author 'Biographical Dictionary of Musicians' (1916), etc.

REMY, Arthur Frank Joseph, American educator: b. Elberfeld, Germany, 26 June 1871. He was educated at Hamburg and Coesfeld, Germany, the College of the City of New York and Columbia University. In 1882 he removed to the United States and from 1891 to 1894 was tutor in Latin and Greek at the College of the City of New York. In 1898 he was Fellow in comparative philology, in 1899-1907 instructor in Germanic philology, and after 1907 professor of Germanic philology at Columbia University. He has lectured in German and English before various organizations and societies; before the Champlain Assembly at the Catholic Summer School of America and at the Columbia Institute of Arts and Sciences. Professor Remy has published 'The Influence of India and Persia on the Poetry of Germany' (1901) and contributions in *Journal of the American Oriental Society*, the *Journal of English and Germanic Philology*, the 'Catholic Encyclopedia,' etc.

RENAISSANCE, or RENASCENCE, is a term given to the period of transition from the Middle Ages to modern times, and to the movement of thought which characterized that period. Etymologically the French *Renaissance*—Italian *Rinascimento*—means *rebirth*. A rebirth of classical forms in literature and art is supposed to have dominated this transition. The metaphor must not be insisted on. There was no rebirth of antiquity in the Renaissance. The change from the mediæval to the modern mind was gradual. One phase of this change was a more general harking back to classical models. This phase, in its bearing on literature, is loosely designated the Revival of Learning. The classical scholars, who revived the refinement of Greek and Roman literature, *litteræ humaniores*, are called humanists.

I. Italy.—The Renaissance began in Italy. Here the memory of classical antiquity had never fully died out. North of the Alps the sway of scholastic philosophy was mightier than in the peninsula. Saint Thomas of Aquin (1225-74) taught at Paris; Albert the Great (1206-80) was a German; Alexander of Hales (d. 1245) and Occam (1280-1349) were Britons; Duns Scotus (d. 1308) was a Scotchman or a Briton, who taught at Oxford. In Italy the mediæval mind of the Florentine Dante (1265-1321), though thoroughly scholastic and Catholic, was at the same time steeped in the culture of ancient Rome. From Dante to Petrarch is a natural transition that cannot be called a rebirth of ancient ideas and ideals.

1. Petrarch (A.D. 1303-74).—The revival of learning in Italy is generally assigned to Petrarch. He is sometimes depicted as an out and out humanist who ignored a future life and made ever onward to a godless expression and gratification of self. Such a picture is false in coloring. Petrarch was ever devoted to the Church and its doctrines, even in the days of wildest enthusiasm for the humanistic culture of Rome and Greece. Witness his letter to Giovanni Colonna: "The true wisdom of God is Christ. Him must we love and reverence above all things, so as to learn true philosophy. We should first be Christians; then we may be what we will." (*Epistolæ*, ed.

Fracasetti, Florence, 1864, ii, 112 ff.) When he was publicly crowned as poet and historian (1341), at Rome, in the Capitol, Petrarch showed his loyalty to the authority of the Church by laying the highly prized laurel crown as a votive offering upon the main altar of the basilica of Saint Peter. The imaginary conversations, held by Saint Augustine and the author, 'De Contemptu Mundi,' ring true in tone, and doom pragmatistic sensuality to the condemnatory judgment of personified truth. Monastic life is praised in 'De Vita Solitaria' and 'De Ocio Religiosorum.' The 'Trionfi' in *terza rima*, celebrate allegorically the triumph of chastity over love, and of divinity over all. Bad traits there were in the character of Petrarch. He took minor orders, so as to enjoy ecclesiastical preferment, and never became a priest. Sensuality besmirched his life. He vauntingly craved for fame and flauntingly scorned scholastic theology. Apart from his 'Canzoniere' and the 'Trionfi' Petrarch's greatest achievement in the cause of letters was the discovery of many a precious manuscript of the Latin classics. Lost works of Cicero and missing parts of the 'Institutiones' of Quintilian, by means of his travels and researches, were again made accessible to the learned.

2. *Boccaccio* (1313-75).—There were in all Italy only very few men who knew anything at all of Greek when Petrarch and his friend Boccaccio put themselves under the tutelage of Leo Pilatus and undertook to gain an entrance into the literature of the Hellenes. Boccaccio was a thoroughgoing humanist. His 'Filocolo' (1338) is wanton. 'Ameto' (1340), a novel, tells with utter abandon the story of his mother's free love, and is fetid with the "reek of the rotten fens." The 50 cantos in *terzine*, that make up the 'Amorosa Visione' (1342) in praise of love, are befouled with filth. The 'Teseide' (1341) gives the tale of Palemon and Arcite in *ottava rima*; it was annotated by Tasso and used by Chaucer for his 'Knight's Tale.' The 'Decameron' (1353) is a collection of an hundred tales, often begrimed with indecency, which Boccaccio gathered from various literatures and set forth in his own manifold and multiform style. The 'Corbaccio' (1354) is a rank lampoon and cynical satire against woman. Boccaccio runs the gamut of the emotions, but plays chiefly and with free fling on lust. His humanism is a riotous revel of the passions. Monks and nuns to him are hypocrites whose ethics is that of the pig-sty. And yet Boccaccio remained loyal to the Church; he died in the faith, bequeathed his library to a friar and set the condition that the legatee pray for his soul. The humanism of Boccaccio was not directly anti-Catholic. He was three times Ambassador of Florence to Rome, received many favors from the Popes and was financially aided by Clement VI. While Boccaccio wallowed in the mire of the erotic myths and legends of paganism, the study of antiquity in a Christian spirit was ever encouraged by the papacy. Superstition and immorality were opposed by the Church, but the intellectual culture of the Greeks and Romans was accepted by her as a means of fulfilling her divine purpose. Saint Paul tried to gain the Stoics of Athens through the medium of their poets Aratus and Cleanthes (Acts xvii, 28).

Some of the fathers of the Church were hostile to the use of pagan classics as a means of education. They feared an inroad of paganism. Yet most of the fathers approved of the cultural value of the study of the ancients, so long as the humanism of antiquity was not allowed to tarnish the beauty of Christian faith and morality; and the popes at the dawn of the Renaissance followed the example of fathers so illustrious.

3. *Valla* (1405-57).—In the course of time some of the Italian humanists became fanatical propagandists of heathenism, but there were ever contemporary scholars who clung to Christian ideals. Lorenzo Valla, 'De Voluptate' (1431), presents an accurate picture of the false and true Renaissance of the times. The characters of his dialogue are historical personages. Lionardo Bruni tries to effect a harmony between Christianity and Stoicism. Niccolò Niccoli is a Christian humanist who defends the agreement of faith and science. Antonio Beccadelli, an Epicurean and the mouthpiece of Valla, teaches the gospel of pleasure, the gratification of every sense. Through him Valla defends the indulgence of all the appetites. Women have no rights. Adultery is the natural thing for man and woman. Continence is a crime. Sensuality is the highest good. Voluptuousness is an act of worship. Besides championing all this paganism and immorality, Valla wielded his trenchant pen against monasticism, the clerical state and what was called "tyrannical priestly domination." His invectives against the papacy were most virulent; and yet this pagan humanist, because of his masterly Latinity, was favored by the popes. Nicholas V made him *scriptor* in the Vatican Library, and later on papal secretary, and used his genius for the translation of Greek classics. Valla fawned and cringed, like others of his class, with such success as to receive from Callixtus III a canonry in Saint John Lateran. The papacy of the Italian Renaissance rather favored than opposed the pagan humanists in order to use their brilliant attainments in the cause of learning. Valla's contemporary, Antonio Beccadelli of Palermo, would scarce have been condemned by Eugenius IV had not his 'Hermaphroditus' glorified the lowest degradations of unmentionable lust.

4. *The Height of the Italian Renaissance* (1453-1527).—The University of Paris had become a papal foundation in 1211. Twenty-eight universities, in various parts of Christendom, received papal charters between 1400 and 1506. The papacy was the main power that brought the Revival of Learning to the height of its glory. Nicholas V (1447-55) founded the Vatican Library, as a means of making Rome the centre of literary culture to the world. At his death, it contained 824 Latin and 352 Greek manuscripts. Among these latter was the famous Vatican Codex, B, of the Greek Bible. The fall of Constantinople (1458) occasioned a rich harvest of manuscripts for the Vatican Library. By 1484, at the death of Sixtus IV, it had a thousand Greek manuscripts of which 58 were Biblical. The library of Saint Mark's, Venice, which Cardinal Bessarion enriched, and the Laurentian Library of Florence belong to the fruitage of the Italian Renaissance. The art of printing soon reached Italy. With papal

approval, the printed Latin Vulgate edition of the Bible was spread broadcast. Between the years 1450 and 1500, there were 177 complete editions of the Vulgate printed: 134 in the Latin original, 15 in German, 13 in Italian, 11 in French, two in Bohemian, one in Dutch and one in Spanish. It is a sign of the vigor of the Christian Renaissance that no classic of ancient Rome was printed, until some 12 editions of the Latin Bible had been put through the press. In 1475 the Venetian Vulgate was issued. The Aldine Press of Venice, between 1494 and 1515, printed 33 first editions of Greek classics. Aldus issued the Septuagint in 1518. The Hebrew Bible was printed at Soncino (1477) and Naples (1486). Meantime, in the papal court, the false Renaissance was represented by the ribaldry and innuendo of Poggio, Filelfo, Aeneas Sylvius Piccolomini (later converted and raised to the pontificate as Pius II), and Cardinals Bembo and Bibbiena. Vain were the efforts of Giannozzo Manetti, Lionardo Bruni, Ambrogio Traversari, Gregorio Corraro, Maffeo Begio, Vittorino da Feltre, and a host of Christian scholars, to stem the tide of paganism. Vain was the thundering of the Franciscan and Dominican friars against the obscenity and filth of the false Renaissance. High ecclesiastics and even popes pampered and supported the ribald set. In the end, Leo X (1513-21) encouraged the abuses which he should have reformed. Had he done his duty, the Church would not have been dealt the severe blow of the Protestant Reformation. He himself was temperate; and yet revelry and carousing were characteristic of his court. The looseness of morals at that court are witnessed to by such immoral plays as Bibbiena's 'Calendra' and Ariosto's 'Suppositi.' Leo encouraged art and letters; but was a mere dilettante, and a dupe to profligates of the false Renaissance. Shortly after the death of Leo X, the sacking of Rome by a Lutheran army brought the Italian Renaissance to a close.

5. *Fine Arts*.—Long before the Revival of Learning, supposed to have been a Renaissance of Latin and Greek forms in letters, the fine arts had reached a high degree of perfection in Italy. Petrarch had not yet made his journeys in quest of manuscripts. Dante (1265-1321), the glory of mediæval Italian literature, had not written his 'Divina Comedia.' Yet the cathedrals of Pisa, Lucca and Pistoia were completed. The basilica of Assisi stood in all its splendor, to be beautified by the frescoes of Giotto (1266-1337). Says Taine: "There is nothing like it. Before seeing it, one has no idea of the art and genius of the Middle Ages." There is no harking back to antiquity on the part of the Italian painters of the 13th and 14th centuries. Christianity provides their subjects. The inspiration of Quattro Cento art is that of Catholic devotion. Cimabue (1240-1301) and his contemporary Duccio produced Madonnas that are masterpieces both in conception and execution. The exquisite draperies, filmy veils, aerial lightness and heavenly grace of Botticelli (1447-1510), a penitent of Savonarola, breathe not a pagan emotion. And as one gazes in rapture on the wondrous Annunciation and other frescoes in San Marco, Florence, one realizes the reasonableness of the story that the brush of Fra Angelico (1387-1455) was guided by eyes that saw through tears of love and devo-

tion for the Madonna and her Child. Even the Cinque Cento plastic art of Italy shows by no means a rebirth of classic forms. There is individuality of self-expression in the painting of Raphael, Da Vinci, Titian and Correggio; and in the sculpture of Donatello and Michelangelo. Only in architecture is an attempt made at a rebirth of antiquity. The result is a hybrid Roman form, which later on becomes still more grotesque by the accretion of barocco vagaries.

II. *Outside of Italy*.—The influence of the Italian Renaissance reached Germany, France, the Netherlands, England and Spain by various and at times devious ways.

1. *Germany*.—Greek, Latin and Hebrew were brought into prominence among Teutonic peoples by traveling professors, and by students who attended Lombard and Tuscan Renaissance schools. The new learning was still wider spread through the establishment of universities and the invention of printing. The religious orders favored the press from the outset. Marienthal (1468), Saint Ulrich at Augsburg (1472), and the Benedictines of Bamberg (1474) did pioneer work in the printing and distribution of literature. The first book printed by Gutenberg, the inventor of the art, was the beautiful "42 line Bible" (1453-55), an edition of the Vulgate that is still extant. The Latin Vulgate was by far the best seller of the times. Most scholars then understood Latin; it was their common medium of epistolary intercourse. The needs of the few, who read German but knew not Latin, were amply met by the printing of the Bible in the vernacular. We still have copies of 18 complete editions of the Bible, printed in German between 1466 and 1521. The publication of Luther's Bible in 1522 was not due, as is too often said, to the lack of a translation that the uneducated could understand; but to Luther's revolt from the teaching and authority of the Church. (Consult Nestle, 'Urtext und Übersetzungen der Bibel' 1897, pp. 124 ff.). This revolt had nothing in common with the rebirth of heathen ideas in Italy. The revival of learning in Germany was from the very outset opposed to the pagan humanism of the peninsula; and yet it but led up to the same disregard of authority in religion as characterized Valla, Poggio and 'the poets,' as they were styled. This spirit of revolt against papal authority did not at first appear. Rudolf Agricola (1443-85) was an eminent classical scholar and a devout Catholic. The Latinist von Langen, and the educationalist Wimpfeling united Christian principles with a love of antiquity. On the eve of the Reformation Reuchlin was defended by Rome in the use of Hebrew and Septuagint readings for the proper interpretation of Holy Writ. Then came Luther, and in his wake Melancthon, Zwingli and Calvin. They were learned, but not large minded. Though keen sighted enough to note the degradation of the court of Leo X, they failed to see that the reformation of ecclesiastical discipline had to be brought about by established authority. They broke loose from that authority; and in theory substituted freedom of private interpretation of the Bible instead of the authoritative teaching of the Church. In reality, Luther attempted not only to topple over the papacy from its power, but to set himself in the stead of the Pope. His was a masterful personality. In translating Romans iii, 28,

he interpolated the word *alone*: "For we account a man to be justified by faith *alone* without the works of the law." Catholics found fault with the interpolation. He badgered them, and wrote: "When your papist gives himself useless trouble about that word *alone*, just tell him prudently: 'Dr. Martin Luther wills it so and says "Papist and jackass are one and the same." Sic volo, sic jubeo; sit pro ratione voluntas. We would not be the pupils and disciples of the papists, but their masters and lords. We, too, would strut it a bit, and be arrogant with these donkies, and as Paul makes boast against his crazy saints, so I make boast against these my jackasses. Are they doctors? So am I. Are they learned? So am I. Are they preachers? So am I. Are they theologians? So am I. Are they controversialists? So am I. Are they philosophers? So am I. Are they dialecticians? So am I. Are they teachers? So am I. Do they write books? So do I. And I will go farther in my boast: I can explain the Psalms and the Prophets. They cannot . . . Why, if there be only one among them that can understand aright a foreword or a chapter of Aristotle, I am ready to be tossed in a blanket. I do not exaggerate . . . Be minded no longer to give to such jackasses other reply to their useless chatter about that word *alone*, than again and again to say: 'Luther will have it so, and says he is a doctor greater than all the doctors of the whole of popery'" (Sendbrief von Dollmetschen, Luther's works, Weimar edition, 30, 2, p. 635; Erlangen ed. 65, p. 107). No wonder Harnack speaks of "the curious logic of Luther's arguments, the errors of his exegesis, and the unjustifiableness and barbarity of his polemic" (Dogmengeschichte, Vol. III, 4, p. 817).

2. *France*.—The conquest of Naples by the French king, Charles VII (1494), marks the beginning of the inflow of Renaissance ideas from Italy into France. The house of Valois ever and anon urged its claims to certain Italian provinces. Military expeditions over the Alps as well as the intervening peaceful relations with the Italians brought about in France a shifting of the nobility and the learned to Italian culture and ideals. The spring-tide of the French Revival of Learning was not antagonistic to the teaching and authority of the Church either in the direction of the paganism of Italian ultra-humanism or along the way of Luther's revolt. Aleandro, an Italian lecturer on Latin, Greek and Hebrew early in the 16th century, became rector of the University of Paris, and wielded a powerful influence against Luther. The Sorbonne was in those days a leader at once in science and in orthodoxy. It condemned the Bibles of Estienne, because they lacked annotations from approved Catholic sources. The first critical editions of the Greek New Testament were those of the devout Catholics Simon de Colines (1534) and Robert Estienne (1st ed., 1546; 3d ed., 1550; 4th ed., 1551). The latter was the first to publish an *apparatus criticus* for the restoration of the New Testament text. French poetry takes on a new form in Marot, Ronsard and their followers. The first French humanists to go the way of Boccaccio and his set are Rabelais (c. 1490-1553) and Montaigne (1533-92). The former was a priest and a

physician; he is known chiefly for the masterful style of his indecent, satirical, humorous and brilliant Epicureanism. Montaigne, the elegant essayist, sets a pace of hostility to the Church and her institutions that has been kept up in France until this day. The most decided return to classic forms is seen in poets, essayists and preachers of a century later—Fenelon, Racine, Corneille, Bossuet, Massillon, Bourdaloue—all devoted Catholics. Pointed architecture had reached the height of its glory in France during the 13th century; it became florid, perforated, embroidered, in the style *flamboyant* of the 15th century; and the Renaissance introduced forms that, though deprecated by lovers of Gothic, were the natural evolution consequent upon the inroad of Italian ideas into the valley of the Loire. In painting, there is not a real French Renaissance school; the work of Claude and the Poussins is of the early modern period.

3. *The Netherlands*.—In the Low Countries, Renaissance architecture pales by the side of mediæval structures. The Van Eycks, Memling, Metsys and others surpassed in their oil coloring; but painting does not reach its glory in the Flemish and Dutch schools until the 17th century. The exquisite sepia of Rembrandt, the gorgeous coloring of the all too sensuous Rubens, the heavenly beauty of Vandyck, the light effects of Ruysdael and Cuyp will ever be the objects of enthusiastic admiration. In letters the critical work of Lipsius and Grotius is to be grouped with the marvels of the Elzevir and Plantin presses. The greatest humanist of the Netherlands was Erasmus. That he was a loyal Catholic is clear from his opposition to Luther; an excellent edition of the works of Saint Jerome (1516), the first critical work done in this Patristic field; and an edition of the Greek New Testament (1516). This latter was not critical. Erasmus relied on a few late manuscripts. For the Apocalypse he had only a single, imperfect codex. So the Dutch scholar went the full length of boldness; he garbled the text and filled in with his own translation from the Vulgate when the original Greek source could not be deciphered or was deemed to be wrong. Some of these readings of Erasmusian coinage found their way into the *textus receptus*, were borrowed from the Dutch work-basket by Luther and appear in the Greek Testament of the British and Foreign Bible Society as well as the Authorized Version. Erasmus is merciless and sarcastic in attacking the extravagances of the schoolmen and the abuses that existed among the clergy; but he must be interpreted in the spirit of the times. His lasting and close friendship for Blessed Thomas More, after whom the 'Praise of Folly' ('*Moriae Encomium*') is playfully entitled, suggests a far greater loyalty to the Church than one might conclude from the invectives and pitiless spirit of that work, the 'Adagia' and the 'Colloquia.'

4. *England*.—Among the English humanists were More, Blessed Cardinal Fisher, Hadley, Linacre, Colet and Fox. Blessed Thomas More, chancellor of the realm, martyred for refusal to take the oath of the supremacy of Henry VIII over the Church in England, was scholarly, witty, learned, an adept in Latin style, and perhaps the best example of Renaissance English

extant in our literature. Though later Elizabethan English became classic, the clearness, strength and elegance of More must be admitted. His 'Utopia' is entirely free from any humanistic slavishness of imitation and shows a firm grasp on social and religious problems of the day. More is not sparing of whatsoever he found to be unbecoming in ecclesiastics, yet his writings breathe a noble, truly Catholic spirit. The revolt of England from the Church cannot be attributed to a freedom of private judgment, which infiltrated from Italy. The germs of this spirit were long developing in England. Witness the conflict between the papacy, represented by Saint Anselm, Primate of England, and the Norman kings, William Rufus and Henry Beauclerc, during the 11th and 12th centuries. Chaucer (1340-1400) was influenced by Italian models, but long preceded the Renaissance in England. Wyclif (1335-84) and the Lollards of the 14th and 15th centuries anticipated the Lutheran Reformation by more than a century in the substitution of simple Bible reading for the authoritative teaching of the Church. The so-called Wyclif Bible, assigned to 1380, which was used by the Lollards, was a translation from the Latin Vulgate, probably of Catholic and not Wyclifite origin (consult Dom Gasquet, 'The Old English Bible,' pp. 102 ff.). Tyndale (1484-1536) showed some influence by the Reformation in Germany; but when his Bible was issued (1525), it by no means marked the beginning of England's movement away from the authority of the Catholic Church.

5. *Spain*.—During the Renaissance, in Spain, architecture added Arabic features to classic forms; sculpture showed strength and individuality; painting developed apace, until the great 17th century masters, Murillo and Velasquez, rivaled the best work of the Italian Renaissance. Cardinal Ximenes published his monumental Polyglot Bible (1514-22). Spanish prose reached its high-water mark in the humorous and refined Cervantes (1547-1616), whose 'Don Quixote' (1605-15) is unsurpassed in the world's literature for masterful, withering, witty, yet courteous taunts at the evils of the day. Dramatic poetry culminated in the voluminous Lope de Vega (1562-1635), to whom 1,500 plays are accredited, and the renowned Calderon de la Barca (1600-81). In objectivity, freedom from lyric self-unfolding, breadth of vision, interest of plot and counterplot and power of dramatic expression, only Shakespeare and the Greek dramatists surpass these two Spanish poets. Along with them should be mentioned the 'Lusiad' of the Portuguese Camoens, who was the first modern epic poet to use a modern theme for his epos and to cut free from ancient trammels in the treatment of his theme. The Spanish and Portuguese Renaissance also expressed itself in exploration and colonization. Columbus, Vespucci, Diaz, Vasco da Gama, Cortez, Pizarro and many others bear witness to the intrepidity and greatheartedness that characterized these Catholic nations. There was in those days an effective league of nations. By common consent of Catholics throughout Europe, the popes had for centuries been the arbiters in national and international disagreements. It was by this overlordship that Nicholas V (1454) conceded to Portugal the right

of colonization from Africa to India; and Alexander VI (1494) divided the Indies into East or Portuguese and West or Spanish.

III. *Counter Reformation*.—The Italian pagan Renaissance ended with the sack of Rome by German Lutherans (1527). Its churches were desecrated and libraries pillaged. The papacy was aroused from the lethargy of Leo X. The Counter Reformation began; it was late but most effective. The Council of Trent, the Roman Index and the Society of Jesus were mighty forces in effecting the needed reform of ecclesiastical discipline. (See *JESUITS*; *LOYOLA*; *INDEX LIBRORUM PROHIBITORUM*; *TRENT*. At the end of the 16th century, chiefly because of the missionary activities of the great religious orders, the Church had so recovered from the staggering blow of the Reformation that the faithful outnumbered those of pre-Lutheran times, and an age of strict religious observance set in.

Professor of Scripture, Woodstock College, Maryland.

RENAISSANCE DECORATION. See *INTERIOR DECORATION*.

RENAISSANCE PAINTING. In central and northern Italy, in the 14th century, the *Giotteschi*, or scholars and imitators of Giotto, soon lost the inspiration and initiative of his art. His great principle of the direct study of nature was much neglected; portraiture, which he had undertaken with imperfect knowledge, became a distinct branch of the art only in the 15th century; and the landscape sentiment was as yet undeveloped. Nevertheless, the seeds of the great awakening of the human intellect, which brought with it a knowledge of antique art and a new intimacy with both Nature and contemporary man,—and a consequent development of all the arts,—were germinating; it appeared almost in the first decade of the 15th century in both Italy and the Netherlands. For this Renaissance, the art of painting presented the most favorable means of expression, of rendering the spiritual rather than the merely

corporeal, the intangible as well as the appearance of reality; and also as an outlet for the individuality which had been so long smothered under formulas and conventions. Rather curiously, this restoration of a long-lost art began, among the Flemish painters, with a suddenness, a completeness, which it was impossible to maintain,—the first great work which figures in the history of this restoration, the great altarpiece in the church of Saint Bavon in Ghent, painted by the brothers Huybrecht (Hubert) and Jan van Eyck (q.v.), is an example of completeness of pictorial representation, spiritual and technical, which the survivor of these painters himself was not able to equal in his other works. The mastery seems complete even of the new process of oil painting, which they are generally credited with having first practically employed. (See OIL PAINTING). Contemporary with this Flemish school of Bruges and Ghent was another of Brabant, with the centre in Brussels, founded by Rogier van der Weyden (q.v.) similar in tendencies. Holland developed an independent school, at Haarlem, the chief of which was Dierick Bouts (d. 1475), whose works show the influence of Van der Weyden, but are marked by somewhat greater luminousness and richness of color and display a knowledge of aerial perspective in landscape. In the paintings of Hans Memlinc (q.v.) of Bruges many of the archaic qualities of his predecessors disappear and are replaced by a greater suavity and feeling for beauty. The influence of the Van Eycks extended down to the end of the 15th century, and Flanders was the seat of a great artistic production, painters and students passing backward and forward between her borders and those of Italy. In France, in the latter part of the century, there was a northern school and a smaller one in Provence, at the court of René d'Anjou; but the important paintings of this period were nearly all destroyed in the religious wars and the Revolution, and our knowledge of the art is derived chiefly from the miniatures.

The patronage which had been extended to the new art in the Netherlands, by princes, corporations, the Church and private individuals in the 15th century, was continued in the early years of the 16th. Foremost among the important representatives of the Northern spirit was Quinten Massys (q.v.), or Massijs, of Antwerp (d. in 1530). Jan Gossart (q.v.), called Mabuse, from his native town of Maubeuge in Hainault, on the contrary, after his journey to Italy, adopted many of the characteristics of the Southern painters, which found favor in the eyes of his countrymen. The Dutch painters of this period were numerous; the first to become widely known abroad was Lucas Jakobsz, called Lucas van Leyden. The movement toward realism and naturalism was slower in the schools of Germany, the chief of which was that of Cologne; the earliest important work now extant is the large altar-piece, a triptych known as the *Dombild*, painted by Stephen Lochener (d. 1451). The painters of this school substituted for the pictorial or distant backgrounds of the Flemings generally a flat, gold one and they differed from them also in the retention of the disc-shaped nimbus behind the heads. The Swabian school, chiefly Alsatian, was distinguished by a remarkable artist, a bold

innovator, Martin Schongauer, the greatest master in Germany of his time, but now best known by his drawings and engravings. The schools of Ulm, Nördlingen and Augsburg were more or less influenced by the Flemish art; two families of painters, the Burckmairs and the Holbeins, combined to raise the fame of Augsburg to the highest degree. In both, an illustrious father was succeeded by a still more illustrious son,—Thoman Burckmair by Hans (q.v.), and Hans Holbein, the elder (q.v.), by his famous son of the same name. The latter, and his brother Ambrosius, are found in Basel in 1515-16. As the most brilliant representative of the German Renaissance, Hans Holbein, the younger (q.v.), rose superior to the limitations of the art of his time and excelled in all branches. His large mural paintings have all been destroyed; but the votive picture executed for the family of the Burgomaster Meyer in 1526, his portraits—including those of the period of his sojourn in England at the court of Henry VIII—and his designs and engravings, have been preserved. From the Franconian school, of which Nuremberg was the centre, came the most formidable of his rivals, Albrecht Dürer (q.v.), a pupil of Michael Wolgemut, painter of altar-pieces and of careful portraits and a skilful wood-engraver. The influence of Nuremberg was diffused over a wide area,—Schleswig, eastern Germany, Bohemia and Poland.

In the north of Europe, the spirit of the Renaissance lagged somewhat behind as compared with its development under the sky of Italy. Climatic conditions, the influence of the Gothic in making angular the forms and the draperies and in diminishing the wall spaces for mural painting, a neglect of the close study of the human body, of proportion, of perspective, a general empiricism in the sciences, the scarcity of examples of antique art, a lack of intelligent and munificent patronage in Germany, even the Reformation itself,—all have been given as partial explanations of this inferiority. Notwithstanding his genius, his earnest researches and his journey to Italy, Dürer's art remained hampered throughout his life by his mediæval limitations. The Italians, who fully appreciated his work, his imagination and intellectual power, declared that he would have been as great as the greatest of their own artists if they had been born in Florence or Rome and had studied the antique. His great influence over his contemporaries was extended by his engravings. Dürer's chief rival among his contemporaries was Albrecht Altdorfer, the Ratisbon master. Lucas Cranach, the elder, so called from his natal town in Franconia, established a school in Saxony, which survived for some years after his death, although unable to reproduce his strong individuality. In Upper Alsace, the renown of Martin Schongauer was continued by two painters, not natives of the province, Matthias Grünewald and Hans Baldung, the latter, also, betraying strongly the influence of Dürer. The school of Swabia, the most eminent and the most learned of the German Renaissance, boasted, in addition to the Burckmairs and the Holbeins, of Martin Schaffner, the so-called Master of Ulm and some other painters. In the Spanish peninsula, at the period of the gradual expulsion of the Moors,

the demand for church pictures brought painters from both Italy and Flanders,—from the latter, among others, Jan van Eyck and Rogier van der Weyden.

Among the causes that contributed to the development of the full flower of the Renaissance in Italy,—in addition to those already mentioned,—may be cited the humanistic spirit, derived largely from the enthusiasm arising from the study of the antique, a general aspiration toward the noble and the beautiful, a new ideal of humanity. Contemporary with this was a revival of learning,—more complete than in Germany. The art of painting, however, it was necessary to reinvent; the study of the human figure, the all important subject in the art of the Renaissance, was undertaken scientifically. Church painting remained for a long time the principal feature and it was greatly favored by the abandonment of the old Gothic Type and the division of the field into panels—which permitted of larger wall spaces, of pictures even longer than they were high. These were executed in fresco, the method perfected in the school of Giotto,—*buon fresco*, painting on the last or smooth coating of plaster freshly applied to the wall and while still wet. That which could not be painted upon in the course of the day was cut out and replaced with fresh lime the next morning. In this manner the color becomes an integral part of the wall. The pigments were water colors, usually earths and minerals. Subsequent retouching was necessarily done *al secco*, on the dry wall and this was generally considered regrettable and somewhat dangerous to the conservation of the painting. Sometimes in the contracts for decorative works we find this retouching insisted upon. Encaustic paintings seems also to have been known; tempera and oil painting were usually reserved for altar-screens and easel pictures, these being generally panels covered with a thin layer of plaster. For their studies and drawings, the artist worked in monochrome or *gris oile*, called by the Italians painting in *chiaro oscuro*; their colors were ground by their apprentices under their own eyes and selected with great care. The art of painting, the most eloquent expression of the Renaissance, was destined to outstrip the other manifestations—sciences and letters, if not architecture. Florence remained the chief seat of this art in the 15th century as in the time of Giotto, though her authority was much less than in sculpture; the leaders were Masolino and his pupil Masaccio (q.v.), to the latter is attributed the honor of having invented a new style in painting. Very different from his intelligent naturalism and fine sense of distinction was the sincere and naive piety of the work of the Dominican friar Fra Giovanni da Fiesole (q.v.), called Fra Angelico; and still more so the tasteless ‘realism’ of Paolo di Dono, known as Paolo Uccello (q.v.). Foremost amongst the direct heirs of Masaccio were Fra Filippo Lippi (q.v.), and his son, called Filippino Lippi (q.v.); the paintings of the former betraying new qualities of color and of *morbidezza*. With him originated a new type of the Madonna, afterward given its highest expression by Leonardo and Raphael,—a presentation in which only the human idyl of motherly love and infantile innocence is sought. In the religious as in the allegorical and mythological sub-

jects of Sandro Botticelli (q.v.), something of the mediæval awkwardness of expression reappears, redeemed by the grace and charm of the conception and the color. With him are associated as exponents of a modern, ingenious spirit, Benozzo Gozzoli, a pupil of Fra Angelico and Pinturicchio (q.v.). Andrea Verrocchio (q.v.) is most popularly known as a sculptor, principally by his equestrian statue of Colleone, the Venetian general; Domenico Ghirlandaio (q.v.), less original than Masaccio but more finished in his expression of realism, was, next to him, the most important painter of the Florentine school of the 15th century and had for a pupil Michelangelo.

Of the Umbrian school, the chief seat was Perugia, though in this province painting was not centralized in the cities; the mystical and serene spirit of Perugino differed from the vivacious and investigating character of his predecessors in the school. The first artist to feel the influence of Florence was Piero degli Franceschi (q.v.), but a more skilful was Luca Signorelli (q.v.), his pupil, whose great painting of the ‘End of the World,’ in the chapel of the cathedral of Orvieto (which had been commenced by Fra Angelico), furnished themes and figures to Michelangelo for his ‘Last Judgment.’ In the best works of the master of Raphael, Pietro Vanucci (q.v.), called Perugino, may be seen the same art, the same suavity and dignity, which characterize much of the early work of his famous pupil; he seems to have been the first in central Italy to master completely the new process of painting in oil.

In northern Italy, the most important centre of the arts was at Padua, the school there having been founded in the second half of the 15th century by Francesco Squarcione (q.v.), known as the ‘Father of Painters,’ and the discoverer of the genius of Andrea Mantegna (q.v.), whom he adopted at the age of 10. In this latter artist, one of the most learned, ingenious and original of his age, the first to master the complete rules of composition, the study of nature was happily balanced by a corresponding study of the antique. In Venice, enjoying a most unusual order and prosperity under the intelligent despotism of her dukes, the revival of art did not manifest itself strongly until the second half of this century, but its final florescence was one of the most brilliant of any age. Two families of painters appear in this first period, the Vivarini and the Bellini, the latter much the more famous. To them Antonello da Messina seems to have communicated the method of painting in oil, which they so soon mastered,—a love of color and splendor being one of the natural gifts of the Venetians. The head of the family was Jacopo Bellini (q.v.), who went to Florence early in his career; his sons were Gentile (q.v.) and Giovanni (q.v.), the latter praised by Albrecht Dürer at the period of his visit to Italy in 1506. In the works of these Venetians appears that ‘atmosphere’ which is so diligently sought by the modern schools,—the feeling of space and air, of the relative position and value of the figures in the general arrangement; the Gothic angularity and awkwardness have been replaced by a fuller knowledge. The most eminent of the followers of Gentile Bellini was Vittore Carpaccio (Scarpaccia), famous for

his cycle of nine pictures illustrating the legend of Saint Ursula.

The greatest name in the Renaissance proper is that of Leonardo da Vinci (q.v.), b. 1452, distinguished as a scientist, an architect, a sculptor, a musician, an author and a painter,—and qualifying painting, himself, as the noblest of the arts and as at the same time a science. But few of his pictures survive, the most famous and the most wonderful being the portrait known as the 'Mona Lisa' in the Louvre. Of his numerous followers, the most productive and the most successful in expressing some of his qualities was Bernardino Luini (q.v.). Michelangelo (q.v.), on the other hand, vehemently protested against placing painting on a level with sculpture, and, indeed, remained to the end of his days '*Michelangiolo Scultore*' rather than the painter, even in his greatest mural decorations. His first patron was Lorenzo de Medici; and it was in 1508 that the Pope Julius II commissioned him to paint the ceiling of the Sistine Chapel in the Vatican. In 1535 he began the 'Last Judgment' on the end wall, and it was unveiled for the Christmas festival of 1541. The qualities of his rugged genius were peculiarly those best adapted to create a school of mannerisms and conventions among his imitators, and we see his influence very strongly developed even in his lifetime, and even in the favorite pupil of Raphael, Giulio Pippi, called Giulio Romano (q.v.). To this pretensions and ignorant school of exaggerated muscular action and violent fore-shortening, which flourished during the decadence of the art, was given the name of the Baroque. The art of Raphael Santi da Urbino so different in quality, was eminently qualified by its combinations of academical distinction with suavity and grace to secure the largest need of popular favor in his own time and in succeeding ages, and his 'Madonna Sistina,' now in the Dresden Gallery, was accepted for more than three centuries as the greatest painting in the world. Andrea del Sarto (q.v.), the best colorist in the Florentine school, may be said to err only in a certain lack of deep feeling; and the versatile talent of Correggio (q.v.) leads up to the splendors of the later Venetian school of Giorgione, Palma, Vecchio and Titian, and, later still, of Paul Veronese, Tintoretto and Tiepolo, the apotheosis of the beauty of oil painting. Giorgio da Castelfranco (so great a Giorgio that he was called Giorgione, that is, Big George) was a fellow student with Titian under Giovanni Bellini. But very few of his authenticated works survive, one of them being in the Louvre. Of Giacomo Palma, the elder (q.v.), called Palma Vecchio, more is known, over a hundred existing paintings being attributed to him, the finest being probably the altar-piece of Santa Maria Formosa, Venice, a single figure of Saint Barbara. With the majestic figure of Titian, Tiziano Vecelli da Cadore (q.v.) (1477-1576), the golden period of the Renaissance may be said to end,—of all the numerous assistants who worked under him during his long life, including a brother and a son, none inherited his power. His paintings, sacred, allegorical, mythological, and portraits, are preserved in all the great galleries of Europe; the most beautiful, and perhaps the most characteristic of this school being the so-called 'Earthly and Heavenly

Love' in the Borghese Palace in Rome. For painting after 1550, see POST-RENAISSANCE PAINTING.

WILLIAM WALTON,

Painter; Author of '*Chefs d'Œuvre*,' *Exposition Universelle, Paris*.

RENAN, ré-nān, Ernest, French historian, philosopher, dramatist and essayist: b. Tréguier, Cote-du-Nord (Brittany), 27 Feb. 1823; d. Paris, 2 Oct. 1892. The priests who directed the school in Tréguier conducted his education up to his 16th year. When he was chosen in 1838 by the Abbé Dupanloup for a place in the seminary of Saint Nicolas du Chardonnet in Paris. Here he remained until, in 1842, he went to Issy, near Paris, to receive a training in philosophy previous to his entering upon his studies for the priesthood. In 1844 he was admitted to the seminary of Saint Sulpice, the chief training school of the French priesthood, where he acquired a knowledge of Hebrew, Arabic and Syriac. The result of these studies in philology was to shake his belief in Catholic orthodoxy, and finding it impossible to enter the priesthood he left the seminary in 1845. While he now maintained himself by teaching in a school at Paris, he continued his historical and philological studies, aided by the counsel and assistance of his sister, Henriette. In 1848 he received the Volney prize for an essay on the Semitic languages. This was amplified and published as '*Histoire générale et Système comparé des Langues sémitiques*' (1855). In the following year he was sent on a mission to Italy by the Académie des Inscriptions et Belles-Lettres, and returning was appointed to a post in the manuscripts department of the Bibliothèque Nationale. His '*L'Avenir de la science*,' though not published until 1890, was written in 1848-49. He next published '*Averroès et averroïsme*' (1852) and several '*Études d'histoire religieuse*' (1856). Having become known as an Oriental scholar, he was appointed a member of a commission sent by the government in 1860 to examine the remains of Phœnician civiliza-

tion in Syria. It was during this journey in Palestine that he wrote his famous 'Vie de Jésus' (1863). He afterward dedicated it to his sister, Henriette, who, having accompanied him, had died at Byblos. During his absence Renan had been appointed professor of Hebrew in the Collège de France, but some expressions of a Unitarian character in his inaugural address conspired with his well-known hostility to traditional Christianity to deprive him of his chair, in which he was not reinstated until 1871.

The publication of the 'Life of Jesus' in 1863 gained for its author a European reputation, and was the first of a series on the 'Histoire des Origines du Christianisme,' which he made the chief labor of his life. This comprehensive work included the following further volumes: 'Les Apôtres' (1866); 'Saint Paul' (1869); 'L'Antichrist' (1871); 'Les Evangiles et la seconde génération Chrétienne' (1877); 'L'Eglise Chrétienne' (1879); 'Marc Aurèle et la fin du monde antique' (1882); 'Index général' (1883). In 1888 he was elected a member of the French Academy. During 1880 he delivered the Hibbert lectures in London on 'The Influences of the Institutions, Thought, and Culture of Rome on Christianity,' and also, at the same time, lectured at the Royal Institution on Marcus Aurelius. In 1883 he was appointed administrator of the Collège de France, where he continued his labors until his death. It is not yet possible to decide with any degree of certainty the ultimate effect of his work on the religious thought of Europe. Around Renan's writings were waged bitter controversies 'whose volume is rivaled only by their acrimony.' Truth was to him a diamond of many facets, and he was never ready to define his position, but to his own generation he was a man of unique personality, and a writer of great erudition. Besides the works already enumerated the following should be mentioned: 'De l'Origine du Langage' (1857); 'Le livre de Job' (1859); 'Essais de morale et de critique' (1859); 'Le cantique de cantiques' (1860); 'Mission de Phénicie' (1865-74); 'Questions contemporaines' (1868); 'La réforme intellectuelle et morale' (1872); 'Dialogues philosophiques' (1876); 'Mélanges d'histoire et de voyages' (1878); 'Corpus inscriptionum Semiticarum' (1881-89); 'L'Ecclesiaste' (1882); 'Souvenirs d'enfance et de jeunesse' (1883); 'Nouvelles études d'histoire religieuse' (1884); 'Discours et conférences' (1887); 'Histoire du peuple d'Israël' (1887-94); 'Feuilles détachées' (1892); and several dramas, such as 'Caliban' (1878). 'L'eau de Jouvence' (1880). 'Le prêtre de Nemi' (1885) and 'L'abbesse de Jouarre' (1886). His 'Lettres intimes' (1896) are a fitting memorial of his devoted attachment to his excellent sister, Henriette. See LIFE OF JESUS; RECOLLECTIONS OF CHILDHOOD AND YOUTH.

RENÉ, ré-nā, or RENATUS I (rē-nā'tūs) OF ANJOU (called also **THE GOOD**), titular king of Naples: b. Angers, 16 Jan. 1409; d. Aix, 10 July 1480. He was the second son of Louis II, Duke of Anjou. He inherited Anjou and Provence, besides claims upon Naples, Sicily and Jerusalem from his brother Louis III in 1434, and these rights were confirmed by Joanna II before her death in 1435. René had in 1420 married the daughter of Charles II, Duke of Lorraine, and had in 1431 become possessed of that dukedom. But in the same year Count Antony of Vaudemont took him prisoner, whereupon the Lorraine states appealed to the Emperor Sigismund to decide the quarrel. René in 1432 was released from his prison for a year by giving his sons as hostages. At last, in 1434, Sigismund gave a decision in René's favor. The dethroned Antony proceeded to the Duke of Burgundy, who required René again to place himself in custody. Scarcely had this been done when an embassy arrived to tender him possession of Naples and Sicily. Philip refused to set René at liberty, and the ambassadors therefore conferred the crown on his wife Isabella, whom her husband named regent of Anjou, Provence, Naples and Sicily. Isabella set sail for Naples, but there found a competitor in Alfonso, king of Aragon, who maintained his position not only against her, but also against René himself, after he had obtained his liberty in 1437. René, obliged to abdicate, returned to Provence. The government of Lorraine he gave up to his son John, who, after his mother Isabella's death, entered into full possession under the title of John II. On this René retired to Provence to give himself to poetry and the arts. His literary remains were edited by Count de Quatrebarbes (1845-46). Consult also Boisson de la Salle, 'Précis Historique' (1820); Bargemont, 'Histoire de René d'Anjou, Roi de Naples, Duc de Lorraine, et Comte de Provence' (1825); Marche, 'Le Roi René: sa vie et ses travaux' (1875); Staley, 'King René d'Anjou and his seven Queens' (1912).

RENÉ II, count of Anjou, grandson of René I: d. 1508. He inherited Vaudemont, Joinville, Aumale, Mayenne and Elbœuf in 1470 from his father, Frederick II; and Lorraine from his mother in 1473. In 1480 he acquired the dukedom of Bar. He fought with the Swiss against Charles the Bold of Burgundy in 1477. After his grandfather ceded Lorraine to Louis XI he tried to establish his rights by force of arms.

RENÉE OF FRANCE, DUCHESS DE FERRARA, French princess, daughter of Louis XII: b. Blois, France, 1510; d. Montargis,

France, 1575. She was highly educated, possessed a keen intellect and took a deep interest in religious controversies. In 1527 she was married to the Duke de Ferrara and in 1535 was converted to Protestantism by Calvin. Her conduct was displeasing to her father who caused her four children to be taken from her and educated in the Catholic faith, and also ordered severe restrictions concerning the princess' freedom of action and compelled her to attend mass. After the death of the duke in 1559 she returned to France and resided in her castle of Montargis, where she was the patron of the French Huguenots and also of various literary celebrities. Consult Vatteau-Calleville, 'Vie de Renée de France' (1781); 'Memorials of Renée of France, Duchess of Ferrara' (1859); Fontana, 'Renata di Francia, duchessa di Ferrara' (1888-93); Rodocanachi, 'Renée de France' (1896); Fawcett, 'Five Famous French Women' (1905).

RENEGADE, one who renounces his religious belief and adopts another; in particular one who gives up Christian belief for Mohammedanism: a renegade is also a traitor who, deserting the cause of his country, enters the service of his country's enemies. Among famous renegades in this sense are Hippas, the Athenian, son of Pisistratus, who fought on the side of Sparta against Athens, and afterward joined the Persians; the Roman patrician Coriolanus, who, when exiled from Rome, took up arms with Volscians against his country; in the Thirty Years' War, Count Mansfeld, who deserted from the Catholic to the Protestant side, and Pappenheim, who deserted from the Protestant side to the Catholic; Archibald Campbell, Duke of Argyll, who in 1619 entered the service of Spain, then at war with Great Britain; the Cossack chief, Mazeppa, who fought against his sovereign at Pultowa with the Swedes; in the 18th century the Duke de Ripperda, who had won distinction in the military service of Spain, but embraced Islam and led the armies of Morocco against Spain; Omar Pasha, hero of the Crimean War, born a Christian, who joined the Turks and embraced Islam; Emin Pasha, a hero of the Equatorial Province of Africa and a German Jew, who became a Mohammedan. At the outbreak of the Civil War in the United States, a considerable number of military and naval officers resigned office and entered the Confederate service.

RENFREW, Canada, town in Renfrew County, Ontario, on the Bonnechère River, eight miles above its confluence with the Ottawa River, 58 miles west of Ottawa, on the Grand Trunk and Canadian Pacific Railways. There is a large waterfall near here and the town has abundant water power. Manufactures include leather, flour, woolens, hosiery, refrigerators, machinery, and there are dairy and lumber interests. Pop. 3,846.

RENI, Guido, gē'dō rā'nē, Italian painter: b. Bologna, Nov. 1575; d. there, 18 Aug. 1642. His first instruction was received in Calvaert's celebrated school at Bologna where he studied the works of Albrecht Dürer. When the school of the Caracci, at Bologna, began to eclipse that of Calvaert, Guido, then 20, joined it. He visited Rome for the first time in 1602, with two of his fellow students, Domenichino and Albano. He made a second visit in 1605 and

Cardinal Borghese employed him to paint a 'Crucifixion of Saint Peter' (now in the Vatican) for the church Delle Tre Fontane. The powerful manner of this picture, and several others of the same period, which manner Guido did not, however, long retain, increased his fame; and at the cardinal's request, he completed the 'Aurora' on the ceiling of the Casino in the Rospigliosi Palace. This picture has become well known and popular from the engravings of it by R. Morghen, J. Burger and others. Paul V at that time employed Guido to decorate a chapel on Monte Cavallo, with scenes from the life of the Virgin Mary. Guido accomplished this work to the satisfaction of the Pope, and was next entrusted with the painting of the memorial chapel in Santa Maria Maggiore. To this period his 'Fortuna,' and the portraits of Sixtus V and Cardinal Spada may be assigned. His paintings are very unequal in style and character, but generally are considered as belonging to three different manners and periods. The first comprises those pictures which resemble the manner of the Caracci, and particularly that of Caravaggio. Faces and forms, stately and grandiose, deep shadows, narrow and intense lights, high coloring, in short, an effort after great effect, distinguish his works of this first period. The second manner is completely opposed to the first and shows the painter at his best, being sweet, natural and unstrained. Its principal features are tender coloring, little shade, an agreeable, though often too dainty, airy and sentimental, treatment of the subject, constituting a style quite peculiar to Guido. His 'Aurora' forms the transition from the first to the second style of his paintings. A third period commences at the time when Guido worked with too much haste and had become more avaricious of money than of fame. His coloring has turned to a greenish and altogether unnatural grayness, and the general treatment is careless and weak. During the government of Pope Urban VII Guido quarreled with his treasurer, Cardinal Spinola, respecting the price of a picture, and returned to Bologna. There he had already executed his 'Saints Peter and Paul' for the house of Zampiere, and the 'Murder of the Innocents' for the Dominican church, and was on the point of embellishing the chapel of the saints with his pictures when he was called back to Rome, loaded with honors, and received by the Pope himself most graciously. But he soon experienced new difficulties, and in 1622 accepted an invitation to go to Naples. Believing himself unsafe at this place, on account of the hatred of the Neapolitan artists for foreign painters, he returned once more to his native city, never to quit it again. At Bologna he painted two beautiful pictures for the church Dei Mendicanti, an 'Assumption' for Genoa and a number of others for his native city and other places, particularly for Rome. There is also a 'Magdalen' by this artist in Chiswick House, belonging to the Duke of Devonshire, of which there is an engraving by Sir Robert Strange. Equally celebrated is a painting of 'Lot and his Daughters,' in the Hampton Court collection, also engraved. In the gallery of the Louvre are several, of which the finest is the 'Centaur Nessus carrying off Dejanira.' In the Dresden Gallery is his 'Christ Wearing the Crown of Thorns.' Consult Bolognini-Amorini

'Vita del celebre pittore Guido Reni' (1839); Dohme, 'Kunst und Künstler Italiens' (Vol. II, 1879); 'Masters in Art' (Vol. IV, 1903); Von Boehm, 'Guido Reni' (in *Künstler-Monographien*, 1910).

RENNELL, rên'êl, James, English geographer: b. Chudleigh, Devonshire, 3 Dec. 1742; d. London, 29 March 1830. At 13 he entered the navy as midshipman and was present at the siege of Pondicherry. In 1763 he entered the East India Company's sea service; the next year was appointed surveyor-general of the East India Company's dominions in Bengal and remained in the service for 13 years. Returning to England in 1777, he published his 'Bengal Atlas' (1779), a work of the highest importance for administrative and strategical purposes. This was followed by the earliest approximately correct map of India, with a memoir (1783). The Royal Society, of which he had been a fellow for 10 years, gave him the Copley medal in 1791. His attention was thereafter directed to comparative geography, and in pursuance of his scheme for a great work on western Asia he published 'Geographical System of Herodotus Explained' (1800); 'Observations on the Topography of the Plain of Troy' (1814), and 'Illustrations of the Retreat of the Ten Thousand' (1816). Finally came 'A Treatise on the Comparative Geography of Western Asia' (1831). He contributed much to the field of African geography, constructing a map of northern Africa for the African Association, and determining the routes taken by Hanno and his own day by Mungo Park. Throughout his life he had been interested when not personally occupied in marine surveying and had collected an immense mass of data which he began to reduce to a system about 1810. He completed current-charts of the Atlantic which were published after his death; and the name of 'Rennell's Current' was given to the current to the southward of the Scilly Islands whose occasional northward set he was the first to explain. He published papers on the ruins of Babylon, the identity of Jerash, the shipwreck of Saint Paul and the landing of Cæsar. In 1801 he was made an associate of the Institute of France, and in 1825 received the gold medal of the Royal Society of Literature. He was buried in Westminster Abbey. Consult Markham, 'Major James Rennell and the Rise of Modern English Geography' (1895).

RENNENKAMPF, rên'ên-kämpf, Paul Charles von, Russian general: b. Baltic Provinces, 1854. He was educated in a military academy, became a staff officer and in 1900 saw service in China as a major-general. He was commander of a division of cavalry in the Russo-Japanese War in 1904-05, and he was criticized for the harshness of his measures in dealing with the revolutionary disturbances in 1905. He took an active part in the early events of the European War, participating in the Russian invasion of East Prussia. He was removed from his command after his failure to prevent the Germans from entering Warsaw and was placed on the retired list. Author of 'Der zwanzigtägige Kampf meines Detachements in der Schlacht von prukden' (1909).

RENNERT, Hugo Albert, American philologist: b. Philadelphia, Pa., 6 May 1858. He was graduated at the University of Pennsyl-

vania in 1876 and later studied at the University of Freiburg. He has been professor of romance philology at the University of Pennsylvania since 1892. He has written 'Spanish Pastoral Romances' (1892); 'Comedias of Miguel Sanchez'; 'Poésies Quédites de Gongora'; 'Life of Lope de Vega' (1904); 'The Spanish State in the Time of Lope de Vega' (1909).

RENNES, rên, France, capital of the department of Ille-et-Vilaine (formerly capital of Brittany), situated at the junction of the rivers Ille and Vilaine. It is divided by the Vilaine, traversing the city from east to west, into the High and Low Town. The High Town is elegantly built on the right bank of the river; the Low Town is unprepossessing and older (11th-13th century) and suffers from frequent inundations. The buildings of interest are: The cathedral, of pseudo-Ionic style; the archiepiscopal palace; the old parliament house, and the statues of many celebrities; the town-house, containing a fine picture gallery, with work by Veronese, Michelangelo, Tintoretto, Van Dyck, Rembrandt and Rubens; splendid scientific and other collections; important archives and a large library. Rennes has courts of justice of first and second instance. The industries embrace tanneries, wax-bleaching, printing, stained paper, hats, boots and shoes, gloves and agricultural implements. There is an extensive trade in butter, honey, wax, cotton and linen yarns, lace, earthenware, etc. Rennes is very ancient, dating from Condate, the capital of the Gallic Redones. It was the scene of the second court-martial of Captain Dreyfus for high treason (September 1899). Pop. 80,000.

RENNET, the prepared inner surface of the stomach of a young calf. It contains much pepsin and has the property of coagulating the casein of milk and forming curd. It is prepared by scraping off the outer skin and superfluous fat of the stomach when fresh, keeping it in salt for some hours and then drying out. When used a small piece of the membrane is cut off and soaked in water, which is poured into the milk intended to be curdled.

RENNIE, rên'î, George, English civil engineer, son of John Rennie (q.v.): b. London, 3 Sept. 1791; d. there, 30 March 1866. He was educated at the University of Edinburgh and in 1811 entered the office of his father. He was inspector of machinery of the mint in 1818-26, and in 1821 engaged with his brother Sir John Rennie (q.v.) in completing several important works begun by their father, among which were the breakwater at Plymouth, various docks, harbors, canals and the London Bridge. He laid out the Liverpool and Manchester Railway in 1826, was chief engineer of the Namur and Liège Railway in 1846, constructed the first screw-propelled ship in the British navy, the *Mermaid*, in 1840, and was engaged in the construction of naval works at Sebastopol and other foreign ports besides those in English harbors. After the retirement of his brother, Sir John, in 1845, he conducted the business of the firm in partnership with his two sons.

RENNIE, John, Scottish civil engineer: b. Phantassie, Haddingtonshire, 7 June 1761; d. London, 4 Oct. 1821. At an early age he showed an interest in mechanics and frequented the

shop of the millwright Andrew Mickle, inventor of the threshing machine. Later he spent three years at the Edinburgh University, and in 1784, having already established a business of his own, he visited James Watt at Soho, Staffordshire, and by Boulton and Watt was engaged to take charge of the work of the Albion Flour Mills, Blackfriars, London. Rennie designed all the machinery, using iron instead of wood for the shafting and framing. In London his reputation rapidly increased until he was ranked foremost among the civil engineers of Great Britain. Among his public works may be mentioned Ramsgate Harbor; Waterloo and Southwark Bridges, across the Thames, and the design of London Bridge, the structure being completed after his death; the breakwater at Plymouth, and several similar structures, where submarine masonry was carried to great perfection. He superintended likewise the execution of the Grand Western Canal, from the mouth of the Exe to Taunton; the Polbrook Canal, Cornwall; the Aberdeen Canal, uniting the Don and the Dee; that between Arundel and Portsmouth, and, his chief work in connection with inland navigation, the Kennet and Avon Canal, between Bath and Newbury, the London Docks, the East and West India Docks, the Prince's Dock at Liverpool, and those of Dublin, Greenock and Leith were also designed by him. In prosecuting his works he made use of the diving-bell which he greatly improved and the steam-dredging machine, apparently without the knowledge that in its invention he had been anticipated by Sir Samuel Bentham.

RENNIE, Sir John, English civil engineer, younger son of John Rennie (q.v.): b. London, 30 Aug. 1794; d. Bengoe, near Hertford, Hertfordshire, 3 Sept. 1874. At 16 he like his brother began the study of engineering under his father. When his father died in 1821 he continued with his brother George to carry on the extensive business left in their hands. He made hydraulic engineering a special study and through his efforts large tracts of land on the eastern coast of England, including part of the Lincolnshire fens, were reclaimed and made extremely productive. The finest works of the Rennies are their bridges, which may be seen in all parts of England and Scotland, London Bridge being the most massive of them all. On the occasion of the opening of this bridge in 1831 John Rennie was knighted, an honor his brother declined. After the dissolution of the partnership in 1845, Sir John practised as an architect. He introduced the system of railways in Sweden, made important surveys of the harbor of Oporto in Portugal and designed, and in great part executed, the harbor of Ponte Delgada in the Azores, one of his latest public works. In 1845 he was elected president of the Institute of Civil Engineers. He was the author of 'Theory, Formation and Construction of British and Foreign Harbors' (1851-54), Consult his 'Autobiography' (1875).

RENNO RENAPPI, the native name for Delaware Indians (q.v.).

RENO, rē'nō, Conrad, American lawyer, son of J. L. Reno (q.v.): b. Alabama, 28 Dec. 1859. He was graduated from the Boston University Law School in 1883 and afterward practised in Boston. He published 'State Regulation of Wages' (1891); 'Non-Residents

and Foreign Corporations' (1892); 'Employers' Liability Acts' (1896-1903); 'History of the Judicial System of New England' (1900); 'The Spirit of Progress,' a dramatic fable (1908-14).

RENO, Jesse Lee, American military officer: b. Wheeling, W. Va., 20 June 1823; d. South Mountain, Md., 14 Sept. 1862. He was graduated from West Point in 1846, served with distinction in the Mexican War, was assistant professor of mathematics at West Point in 1849 and at the outbreak of the Civil War was commissioned brigadier-general of volunteers. He rendered gallant service at Roanoke Island, Newbern and Camden, and was promoted major-general in 1862. He took part in the battles at Manassas and Chantilly and after repulsing the Confederates under General Lee at South Mountain was killed while leading a charge.

RENO, Jesse Wilford, American engineer, son of J. L. Reno (q.v.): b. Fort Leavenworth, Kan., 4 July 1861. He was graduated from Lehigh University in 1883, afterward pursuing a special course in mining and engineering. In 1885-90 he was engaged in mining in Colorado and later became an electric railway expert. In 1892 he invented the inclined elevator or moving stairway (see ESCALATOR), for which he was awarded the medal of the Franklin Institute in 1914 and later became consulting engineer of the Otis Elevator Company. He was a frequent contributor to technical publications.

RENO, Marcus Albert, American military officer: b. Illinois, about 1835; d. Washington, D. C., 31 March 1889. He was graduated from West Point in 1857 and at the outbreak of the Civil War was made first lieutenant in the United States army. He was promoted captain in the same year, brevetted major for gallantry at Kelly's Ford, Va., in 1863, lieutenant-colonel for services at Cedar Creek and in 1865 was brevetted brigadier-general of volunteers and colonel of regulars for distinguished service throughout the war. In 1876 he was engaged in the campaign against the Indians under Sitting Bull, holding command second to General Custer. In the engagement in which Custer and nearly all his regiment were killed, Reno escaped through cowardice and in consequence of his failure to support his associates and other serious charges he was dismissed from the service.

RENO, Nev., city, county-seat of Washoe County, on the Truckee River and on the Western Pacific, the Southern Pacific and the Virginia and Tennessee railroads; in the extreme western part of the State, about 30 miles north of Carson City. It was settled in 1858 by eastern emigrants who had started for California. It was incorporated in 1869 and in 1901 was chartered as a city. It is in a farming and stock-raising region and is the most important and largest city in the State. The chief industrial establishments are railroad machine shops, which have 2,500 employees; abattoir and packing houses, electric-power plant, pressed brick works, two flour mills, a cracker factory and a number of smaller factories. The trade is chiefly in farm products, livestock and manufactures. It is an important distributing point for a vast terri-

tory. The principal public buildings are a government building, eight churches and the Nevada State Hospital for Mental Diseases. The educational institutions are the State University, opened in 1886, State Agricultural College and Experiment Station, a normal school, Academy of Our Lady, public and parish schools and a Carnegie library. The five banks have a combined capital of \$2,500,000 and the annual amount of business is \$64,000,000. The government is vested in a mayor and a city council of five members, all of whom are elected by the people. Pop. 18,300.

RENOIR, ré-nwâr, **Auguste**, French painter: b. Limoges, 1841. He exhibited at the first Impressionist Salon in 1874 after studying under the impressionist Monet and others of the same school. While he paints figures principally and possesses singular skill in depicting flesh color and skin texture, as well as facial expression, he has remarkable success in landscape, in fruit and in flowers, which he sets on the canvas with astonishing boldness and vividness of presentation. He is certainly one of the most original and independent of the school to which he belongs. His 'Jeunes Filles au Piano' is a good example of his qualities; among others 'Une Danseuse,' 'La Rose,' 'Une tasse de thé,' and 'La Seine à Argenteuil.' Among his portraits are those of Claude Monet, his master, and the composer Wagner. Consult Duret, 'Les Peintres Impressionistes' (1879); also 'Exposées en partie à l'Exposition centennale de l'art français' (1900).

RENOUF, ré-noof, **Emile**, French painter: b. Paris, 23 June 1845; d. Havre, 6 May 1894. He chose for his subjects the scenery of the sea and incidents in the lives of those who live on the seashore, fishermen, etc., but he also did some good work in landscape and genre. His fine marine 'After the Storm' is in the New York Metropolitan Museum and his 'Helping Hand' (a child holding to an oar, while a sturdy fisherman rows), is in the Corcoran Gallery, Washington. While in New York (1887-88) he painted 'Brooklyn Bridge,' which at present is in the public gallery at Havre. In 1883 he was awarded a first class medal at Munich and in 1889 the Legion of Honor.

RENOUF, Sir Peter Le Page, English Egyptologist: b. Guernsey, 23 Aug. 1822; d. London, 14 Oct. 1897. He was educated at Elizabeth College, whence he passed to Pembroke College, Oxford, where he came under the influence of Newman and the Tractarians and in 1842 entered the Roman Catholic Church. From 1855 to 1864 he was professor in the Catholic University of Ireland, first of French literature and the history of philosophy and subsequently of ancient history and Oriental languages. He began his career as an Egyptologist about 1860 and in 1863 defended the work of Young and Champollion against Sir George C. Lewis. He opposed the dogma of papal infallibility and in connection with this subject wrote on 'The Condemnation of Pope Honorius' (1868) and 'The Case of Pope Honorius Reconsidered' (1869). From 1866 until 1885 he was an inspector of schools and during 1885-91 he was keeper of the Egyptian and

Assyrian antiquities in the British Museum. In 1875 he published 'An Elementary Grammar of the Ancient Egyptian Language' (2d ed., 1896), and in 1879 delivered a course of Hibbert lectures on the 'Origin and Growth of Religion as Illustrated by the Religion of Ancient Egypt' (1880; 2d ed., 1884). He was knighted in 1896. He left unfinished a translation of the 'Book of the Dead,' with commentary, which at the time of his death was in course of publication (1892 et seq.) in the 'Proceedings' of the Society of Biblical Archaeology, of which he was president from 1887. The work was completed from Renouf's notes by E. Naville. Renouf was one of the most careful and trustworthy Egyptologists of his time and was in addition a most versatile linguist. For a sketch of him, with a bibliography of his writings, consult the 'Proceedings' of the Society of Biblical Archaeology (Vol. XIX, 1897).

RENOUVIER, Charles Bernard, French philosopher: b. Montpellier, 1 Jan. 1818; d., 1 Sept. 1903. After studying at the Ecole Polytechnique at Paris, he began to take an interest in politics. He lived a life of retirement devoted to study and writing. His principal works are 'Essais de critique générale' (1854-64); 'Science de la morale' (1869); 'Uchronie' (1876); 'Esquisse d'une classification systématique des doctrines philosophiques' (1885-86); 'Philosophie analytique de l'histoire' (1896-97); 'Histoire et solution des problèmes métaphysiques' (1901); 'Victor Hugo: le Poète' (1893); 'Le Philosophe' (1900); 'Les Dilemmes de la métaphysique pure' (1901); 'Le Personnalisme' (1903); 'Critique de la doctrine de Kant' (1906). His philosophy is idealistic and is based on Kant. However, he differs from Kant in several respects. He trusts only in personal experience as shown by phenomena as the true test of validity and distrusts every doctrine of an unknowable as a basis of explanation of the universe, whether that unknowable be spiritual, ideal or material force. Realities are of objective as well as subjective aspect. In his theory of volition, he holds that liberty is the real and fundamental characteristic of man; and that belief consists also in an act of will. In the field of religion, he is opposed to any doctrine of an infinite God, but believes that the consent of the doctrine of a finite God and immortality is rational and justifiable. Consult Prat, L., 'Les Derniers entretiens de Charles Renouvier' (1904); Darlu, A., 'La Morale de Renouvier' (1904); Séailles, G., 'La Philosophie de Charles Renouvier' (1907).

RENOVO, rê-nô'vô, Pa., borough in Clinton County, on a division of the Pennsylvania railroad, about 125 miles northeast of Pittsburgh and 25 miles northwest of Lock Haven. It is in a region of the Alleghany Mountains noted for grand scenery and an abundance of game. Renovo is a summer resort which is growing in favor. It has considerable industrial interests connected with the extensive bituminous coal-fields and the fire-clay deposits in the vicinity. The chief industrial establishments are the Pennsylvania railroad shops, the coal yards and the brick works. There is a national bank, with (1917) capital \$50,000 and resources \$986,970. Pop. about 4,621.

RENSSELAER, rěn'se-lér, Ind., city, county-seat of Jasper County, on the Iroquois River and on the Chicago, Indianapolis and Louisville Railroad, about 100 miles northwest of Indianapolis. It was settled in 1834 by David Nowles, John Nowles and Joseph Yeoma. It was incorporated in 1850 and chartered as a city on 1 May 1896. Rensselaer is in an agricultural region; and its industries are chiefly connected with farm products and livestock, of which it makes considerable shipments. There are five churches, Saint Joseph's College, a high school, public elementary schools, Monnet School for Girls, a Catholic seminary, public library, business schools and a national bank, with (1917) capital \$60,000 and resources \$574,602. The government is vested in a mayor and a council of six members elected biennially. Pop. 2,393.

RENSSELAER, N. Y., city in Rensselaer County, on the Hudson River and the Boston and Albany, the New York Central and Hudson River railroads, opposite Albany and six miles south of Troy. It is connected with Albany, Troy and other cities by electric lines and by steamboat with many cities and towns on the river. Three large bridges span the Hudson and connect Rensselaer with Albany. The first settlement was made by the Dutch. It was incorporated as a village in 1815 and in 1897 was chartered as a city. It was called Greenbush until it became a city, when it took the name Rensselaer. The village of Bath was annexed in 1902. Rensselaer is a commercial and manufacturing city, noted for its chemical and aniline works, felt factory, tannery and shirt-waist factory. According to the United States census for 1914, the city had 32 manufacturing establishments, employing a capital of \$2,317,925 and yielding products valued at \$2,755,418. A large number of persons are employed in connection with the railroads and steamboats and in the offices, stores and factories in Albany and Troy. There are 10 churches, two public schools, one parish school, Saint John's Academy, Saint John's Orphan Asylum, Franciscan Father's Home, Genet Barracks and Memorial Park. Fort Cralo, built in 1642, still stands. The government is vested in a mayor and a common council of 10 members, elected biennially. Pop. 11,213.

RENSSELAER POLYTECHNIC INSTITUTE, located at Troy, N. Y. It was founded by Stephen Van Rensselaer in 1824 as a school of practical science, being the first school of science and the first school of engineering to be established in any English-speaking country. It was first opened to students in January 1825 and incorporated in March 1826. It was at first named the Rensselaer School, afterward the Rensselaer Institute and finally the Rensselaer Polytechnic Institute. Lectures on land surveying and engineering were given as early as 1823; and after 1850 the Institute became more distinctly a school of civil engineering; the course at that time was lengthened from one year to three years. It now offers two courses of four years each, one in natural science and one in civil engineering. These courses include instruction in chemical analysis, mineralogy, metallurgy and assaying, as well as in the design and construction of roads, railroads, bridges, roofs, arches, dams, steam

engines, electric engines, dynamos, turbines, foundations, waterworks, tunnels, sewers and canals. The degrees of B.S. and C.E. are conferred. The students in 1917 numbered 687 and the faculty 63. Its influence has been widespread. Students have come to it from 42 of the States of the Union and 25 foreign countries, and its graduates are at present practising their profession in 45 of the States and 19 foreign countries. Its standing as a professional school is shown by the following extract from the report to the German government by Prof. A. Riedler of the Royal Polytechnicum of Berlin: "The greatest number of renowned hydraulic and railroad engineers of America are graduates of this school."

RENT. Rent is commonly defined as the income received for the use of land, whether the owner uses it himself or leases it to some one else. Land, however, must be distinguished from real estate which includes not simply the land itself, but the permanent improvements and the fixtures on the land. Land in the strictly economic sense means simply the original and indestructible properties of the soil. Economic rent would, therefore, include only the income received for the use of these original and indestructible properties. There is still some question as to whether land should be so defined as to include the available supplies of plant food which may be found in the soil. From the standpoint of the original settler on a piece of virgin land, considerable supplies of plant food are found in the soil and may, therefore, be regarded as original properties. In older and more permanent settlements, however this original supply of plant food has long been exhausted and whatever plant food there is in the soil must be regarded as one of the improvements which have been placed on the land, along with draining, fencing, wells, buildings and so forth. In short, while a certain amount of plant food may have been one of the original properties of the soil, it is clearly not an indestructible property. It may easily be exhausted and usually has to be replaced by human endeavor. There is, therefore, a tendency to define land in stricter terms so as to include only the physical and geometrical properties of solidity, extension and location. Rent in this strict and narrow interpretation is that which the owner receives for the use of these physical and geometrical properties. This definition is satisfactory for urban land. The only difficulty is in applying it to farm land. The physical and geometrical properties of solidity, extension and location are the only properties that give urban land any appreciable part of its value. These are the only properties needed for building purposes. Farm land, however, derives a large part of its value from soil fertility which is partly chemical. The farm owner who receives rent from his farm is not likely to distinguish that part of his income which is due to the chemical fertility of his soil from that part which is due to the physical and geometrical properties of solidity, extension and location.

The principle which determines the amount which a piece of land yields in the way of rent has been variously stated. The most widely accepted statement is that formulated first by the Scotch writer, Anderson, and later by the Englishman, Ricardo. Both regard rent as d

to a preferential value. If we assume that there is always free land, that is, land which can be had free of charge, then the utmost which will be paid for the use of a particular piece of land is the equivalent of the superiority of this land over such free land as may be had. Something can always be produced on free land. If we can determine how much more can be produced with the same amount of labor and expenditure on a given piece of land than could be produced on free land, the difference between these two products will measure the degree of preference for the piece of land in question; or this difference in product will represent the preferential value of the better piece of land. Stated in formal terms, this law of rent is as follows: The rent of a given piece of land is equal to the difference between what it will yield under the method of treatment suited to its condition and that which the best free land available could be made to yield with the same application of labor and capital under a treatment suitable to its condition.

The cause of rent is undoubtedly the scarcity of land. This does not mean that all land of all qualities is scarce, but that lands of certain desirable kinds and qualities are scarce. These are the only lands that yield rent. If we consider a certain desirable piece of land and find that there is not enough of the same grade to supply all the needs of the community, then, in order that the needs of the community may be supplied, inferior grades of land must be brought into use. Rather than make use of these inferior grades, cultivators, builders and so forth will pay something for the use of the better grades. While the cause of rent is the scarcity of the better grades of land, the amount of rent is limited by the presence and availability of inferior grades of land and their degree of inferiority. If there is an abundance of land only slightly inferior to the piece of land in question, this piece of land will command a low rental. If there is a scarcity of inferior land and if it is vastly inferior to the piece of land in question, then the piece of land in question will command a high rental. There is another way of looking at the question of rent, though it leads to much the same conclusion. The rent of a given piece of land may be said to be equal to its social productivity. If a given piece of land is brought into cultivation, the labor and capital necessary to its cultivation cannot be used on other land, or if it is thrown out of cultivation, the labor and capital which formerly cultivated it must be now employed on other land. How much difference does it make to the community whether this piece of land is cultivated or not? If it is a good piece of land and is thrown out of cultivation, the labor and capital which formerly cultivated it will produce less when employed on other land than it formerly produced on the piece of land in question. When we determine how much less, we have a measure of the social value or the social productivity of the piece of land in question. If it is very poor land, and there is plenty of other land equally good on which the labor and capital can be employed, it will make no difference whatever to the total productivity of the community whether the piece of land in question is cultivated or not. In that case the piece of land in question is worth nothing and will command no rent. The

more difference it makes to the community whether the piece of land in question is used or not, the higher the rental which it will command.

THOMAS N. CARVER,

Professor of Political Economy, Harvard University.

RENT, Law of. Rent being the sum, duty or return levied on the occupants, lessee or user of land, buildings, apartments, rooms, machinery, tools, power, heat, artificial light, etc., for the benefit of the owner it follows that a relation is thereby instituted from which many legal complications may arise. The relation established that of landlord and tenant. A subtenant is one who rents all or part of the premises from the original tenant. A lease is a legal instrument by which the relation of landlord and tenant is formally established and which to a very great extent defines the privileges, duties and obligations of the parties subscribing to it. The relation is often less formally established and may arise by implication if the acts of the parties are consistent with it. A tenant is bound to pay the stipulated rent at the time stated in his lease or contract or otherwise agreed upon. Should he fail to do so, however, his status of tenant is not affected, but the landlord acquires a right to institute a civil action to recover the amount in default and further may levy a distress. A tenant who occupies the premises beyond the term of his lease or contract becomes liable for the rent of the next ensuing period, week, month, etc., as the case may be. He becomes in such a case a tenant at will and his tenancy may be terminated at the will of the landlord. Statutes in some jurisdictions hold that a tenancy not governed by a lease is a tenancy at will. Such a tenancy may be terminated in various ways, i.e., by the lease of the property to a third person, by the death of either the landlord or tenant, by the sale of the property, or by any act on the part of the landlord amounting to a demand for possession or showing such intention. A lease once signed, the lessee or tenant is ordinarily liable for the rent agreed upon whether or not he takes possession, except in the case where the premises are destroyed before the beginning of the term. A lease is terminated by the sale of the property under foreclosure proceedings. Unless contained in the agreement a landlord is not compelled to make repairs, nor is he liable for them, and seldom for any injury caused by the condition of the premises. A landlord is generally liable to tenants for injuries due to accidental defects, and for any negligence on his part. In modern states increasing liabilities are being placed upon property-owners, property being held in less divine regard than formerly and persons proportionally higher. Thus in modern cities, the landlord is often obliged to keep passageways and approaches lighted, to prevent any obstruction of a passageway, which would render it dangerous. The duty of removing ice and snow in many cases devolves upon the tenant. Where heat, light, power, etc., are included in the agreement, failure of the landlord to supply same creates a right of the tenant to damages. The owner is obliged to maintain the premises in a habitable condition. Disputes and suits at law over repairs

have been so numerous as to cause very many landlords to insert in their leases a clause that all repairs shall be made by the tenant. Of course this involves a reduced rental. An action at law at any time can be maintained by the landlord, or his assignee, to recover rent, and under ordinary circumstances no prior demand is necessary; in few jurisdictions, however, is the landlord authorized to attach the property of a tenant, but never the household goods, trade tools, etc. Courts have held that the right to collect rent was a species of real property that might be delegated, held in fee, or willed to posterity. Every State has its own laws and many municipalities have ordinances that tend to complicate greatly the relations of landlords and tenants. It is impossible, therefore, within the limits of the present article to give details of the statutes obtaining in the several jurisdictions. See *FEE; LANDLORD AND TENANT; LEASE; PROPERTY, LAWS OF*. Consult Kent, J., 'Commentary on American Law' (14th ed., 4 vols., Boston 1896); Maine, H. J. S., 'Lectures in the Early History of Institutions' (7th ed., London 1897); 'Corpus Juris' (New York 1915 et seq.); Tiffany, H. T., 'The Law of Landlord and Tenant' (New York 1913); Williams, T. C., 'Principles of the Law of Real Property' (19th ed., London 1901).

RENTON, Wash., city in King County, 10 miles southeast of Seattle, on the Columbia and Puget Sound, the Northern Pacific and the Chicago, Milwaukee and Saint Paul railroads. There are clay, coal and lumber interests and manufactories of bricks, briquettes and cars. Pop. 2,740.

RENUNCIATION, in law, the act of giving up a right, such as the position of an executor or administrator of an estate, or any other office, charge or claim to which the person renouncing is legally entitled. The term is applied especially to the act of an executor, who, having been nominated in a will, and having the option of acting as such or not, declines to act, and in order to avoid any liability expressly renounces the office. There are proper legal forms for such action.

RENWICK, Edward Sabine, American engineer and patent expert: b. New York, 3 Jan. 1823; d. 19 March 1912. He was graduated from Columbia in 1839 as a civil and mechanical engineer and became superintendent of large iron works at Wilkesbarre, Pa. In 1849 he began his career as a patent expert and in 1862, with his brother Henry Renwick, he repaired a break 82 feet long and 10 feet wide in the bilge of the Great Eastern while afloat, a feat deemed an impossibility by experts. He invented several machines and mechanical appliances and published 'Practical Invention' (1893).

RENWICK, James, Scottish covenanter: b. Moniaive, Dumfriesshire, Scotland, 15 Feb. 1662; d. Edinburgh, 17 Feb. 1688. He was educated for the ministry at the University of Edinburgh, but upon declining to recognize Charles II as the head of the Church was refused a degree. He finished his education at Groningen, Holland, was ordained in 1683, returned to Scotland and engaged in preaching at conventicles. He was outlawed in 1684 as a result of publishing with Alexander Shields 'An Informatory Vindication of the Covenant-

ers.' When James II came to the throne (1685), Renwick with 200 men went to Sanquhar, and published a declaration rejecting him, and in 1687, as the acknowledged leader of the Cameronians a price was put upon his head, and he was hunted from place to place. He was captured in the following year and executed at Edinburgh.

RENWICK, James, American scientist: b. Liverpool, England, 30 May 1790; d. New York, 12 Jan. 1863. He came with his parents to New York in 1794, was graduated from Columbia and in 1812 acted as instructor in natural philosophy there. In 1814 he became a topographical engineer with rank as major in the United States service and in 1820-53 was professor of chemistry and physics at Columbia. In 1840 he was engaged as one of the commissioners to survey the boundary line between United States and New Brunswick. His publications include 'Outlines of Natural Philosophy' (1822-23); 'Treatise on the Steam Engine' (1830); 'Elements of Mechanics' (1832); 'Outlines of Geology' (1838); 'Applications of the Science of Mechanics to Practical Purposes' (1840); 'Memoir of De Witt Clinton' (1840); 'Life of John Jay' and 'First Principles of Chemistry' (1841); 'First Principles of Natural Philosophy' (1842); lives of 'David Rittenhouse' (1839); 'Robert Fulton' (1845), and 'Count Rumford' (1848), in Sparks's 'Library of American Biography'; lectures on 'Chemistry Applied to the Arts,' etc.

RENWICK, James, American architect: b. New York, 3 Nov. 1818; d. there, 23 June 1895. He was son of the preceding, and was graduated at Columbia College in 1836. Among his many works are Grace Church, New York, completed in 1845; the Smithsonian Institution and the Corcoran Art Gallery, Washington, D. C.; Vassar College, Poughkeepsie; and Saint Patrick's Cathedral, New York. This list of buildings shows the versatility of this truly learned architect, whose mastery of French-Gothic, both in its details and proportions, enabled him to give New York two of the noblest ecclesiastical exteriors in the city. He gathered a remarkable collection of professional material which he bequeathed to the Metropolitan Museum of Art, New York.

REORGANIZED CHURCH OF JESUS CHRIST OF LATTER DAY SAINTS, The, organized 6 April 1860, at Amboy, Ill. On 27 June 1844 Joseph Smith, President of the Church of Jesus Christ of Latter Day Saints and his brother Hyrum, the Patriarch, were murdered by a mob at Carthage, Ill. Following this event several aspirants arose claiming the right to the presidency of the Church. The most prominent of these were Sidney Rigdon, William B. Smith and James J. Strang. Sidney Rigdon, who served as first counselor to the Prophet Joseph Smith 1833-44, was the first to make the claim, stating that the Church should choose him as 'Guardian' to stand for the martyred president. By appointment, a conference of the Church was held 8 Aug. 1844, in Nauvoo, Ill., at which Mr. Rigdon presented his claims at length and was rejected by the assembled members when the question was put to vote. At this same conference the Twelve Apostles were sustained by unanimous vote as

the presiding quorum of the Church agreeable to the revelation which reads: "The Twelve traveling counselors are called to be the Twelve Apostles, or special witnesses of the name of Christ in all the world; thus differing from other officers in the Church in the duties of their calling. And they form a quorum equal in authority and power to the three Presidents previously mentioned." (Doctrine and Covenants 107; 23-24). After the rejection of his claims, Sidney Rigdon became disaffected and withdrew to Pittsburgh, Pa., with a small following, over which he presided for a few years, when the organization, for lack of members, ceased to exist. William B. Smith claimed the right to the presidency by virtue of being the only surviving brother of Joseph Smith. His following was always small and soon disbanded. James J. Strang declared that he had been appointed by the Prophet Joseph Smith to be his successor, in a letter written but a few days before the tragedy. He was a man of some ability and gathered about him a few prominent men who refused to remain with the Church under the leadership of Brigham Young and the Twelve Apostles. For a time his organization appeared to flourish, but like the organizations of Sidney Rigdon and William B. Smith, soon fell into decay and was deserted by many members. In the year 1852 Jason W. Briggs, a resident of Beloit, Ill., and Zenas H. Gurley, gathered some of the scattered remnants from these organizations and formed branches at Beloit, Waukesha and Yellowstone, in what they called the "New Organization of the Church." Jason W. Briggs, it is said, held the office of Elder in the Church of Jesus Christ of Latter Day Saints previous to the death of Joseph Smith. Until 1846, the year of the exodus to the west, he remained a member of the Church. Later he joined the organization of James J. Strang, then that of William B. Smith in which he remained until 1851. Zenas H. Gurley, before the death of the Prophet Joseph Smith, held the office of Seventy. He also accepted the leadership of Brigham Young and the Twelve Apostles until the exodus in 1846, when he withdrew and became a member of the Church under James J. Strang. In this organization he labored diligently until 1851. After Jason W. Briggs and Zenas H. Gurley joined their forces in 1852, they commenced to preach the doctrine of the "rejection" of the Church of Jesus Christ of Latter Day Saints or the "original church" because they said the saints had failed to build the temple at Nauvoo within a given time, which expired at, or shortly following, the death of Joseph and Hyrum Smith. Because of this "rejection" they said it became necessary for the church to be newly organized that it might find favor with the Lord. They also promulgated the doctrine of "lineal priesthood" claiming that it was the right of the oldest son of Joseph Smith to succeed his father in the presidency of the Church. For a number of years they labored to induce Joseph Smith, son of the Prophet Joseph, to take the presidency of the new organization, but without success. Finally, at a conference held at Amboy, Ill., 6 April 1860, he consented and was installed as president of the new organization, which was later incorporated as the Reorganized Church of Jesus Christ of Latter Day Saints.

The Saints' Herald, the official publication of the Church, was begun 1 Jan. 1860, at Cincinnati, Ohio. It was removed to Plano, Ill., March 1863. Since 1881 it has been published at Lamoni, Iowa. Joseph Smith was its editor-in-chief from 1865 to 1914. The Church held annual and semi-annual conferences until and including 1882, when the semi-annual were discontinued. The headquarters were at Plano, Ill., from 1863 to 1881; since then at Lamoni, Iowa. The quorums of the reorganization are organized in the same order which existed at the death of Joseph Smith. The doctrines are as follows:

A belief in God the Eternal Father, his Son Jesus Christ, and the Holy Ghost.

That men will be punished for their own sins, and not for Adam's transgression.

That all men may be saved by obedience to the laws and ordinances of the gospel, namely, faith in God and the Lord Jesus Christ; repentance; baptism by immersion for the remission of sins; laying on of hands for the gift of the Holy Ghost; the resurrection of the body; that the dead in Christ will rise first; that men shall be judged, rewarded, or punished, according to the degree of good or evil they shall have done.

That a man must be called of God, and ordained by the laying on of hands of those who are in authority, to entitle him to preach the Gospel, and administer in the ordinances thereof.

In the same kind of organization that existed in the primitive Church.

That in the Bible is contained the word of God, so far as it is translated correctly. That the canon of Scripture is not full, but that God, by His Spirit, will continue to reveal His word.

In the powers and gifts of the everlasting gospel, namely, the gift of faith, discerning of spirits, prophecy, revelation, healing, visions, tongues, and the interpretation of tongues, wisdom, charity, brotherly love, etc.

That marriage is ordained of God; and that the law of God provides for but one companion in wedlock, for either man or woman, except where the contract is broken by death or transgression.

That the doctrines of a plurality and a community of wives are heresies. The Book of Mormon says: "Wherefore, my brethren, hear me, and hearken to the word of the Lord: For there shall not any man among you have save it be one wife, and concubines he shall have none."

That the religion of Jesus Christ, will, if its precepts are accepted and obeyed, make men and women better in the domestic circle, and better citizens, and consequently better fitted for the change that cometh at death.

That men should worship God in "Spirit and in truth;" and that such worship does not require a violation of the constitutional law of the land.

The Church has been more aggressive in its fight against polygamy than any other organization. The local work is divided into the following organizations according to latest reports: Two States, Lamoni, Iowa; and Independence, Mo.; both organized in 1901; 74 districts; 62 in the United States, two in Australia, five in England, two in Wales, two in Canada and one in Nova Scotia. The reorganization supports Graceland College and a home for the aged, both at Lamoni, Iowa. It is prosecuting missionary work throughout the United States, the Canadas, Australia, New Zealand, Society Islands, Sandwich Islands, the British Isles, Scandinavia and other countries. The membership is about 75,000.

REPAIRS. See LAW OF LANDLORD AND TENANT.

REPARATIVE SURGERY. See SURGERY.

REPEAL, the rescission, annulling, or revocation of a law. Repeal of a statute may be express or implied. It is express when the repealing statute states specifically that a prior statute has been abrogated. It is implied when the statute does not refer specifically to a prior

statute but contains provisions wholly or in part repugnant thereto. In case only a part is repugnant, the other part of the prior statute continues in effect.

REPEAL MOVEMENT, the agitation for the repeal of the Union between Great Britain and Ireland. This agitation began almost at the moment of the Union, and has continued to the present time. Robert Emmet sacrificed his life to the cause of repeal in 1803. But the word repeal is most intimately connected with the name and career of Daniel O'Connell, the Irish "Liberator." O'Connell died in 1847, and the cause of repeal was taken up by the Young Ireland party of 1848; by the Fenians, whose operations came to a head in 1865-67; and finally by the Home Rule party organized under the leadership first of Isaac Butt, in 1870, and later under the leadership of Charles S. Parnell. During the celebrated Parnell Commission of 1888-89, however, the Home Rule party, through their counsel, disclaimed all desire for repeal, maintaining that their aims were confined to the obtaining of Home Rule in the strict, or restricted, sense of the word.

REPEATER, in arithmetic, an indeterminate decimal in which the same figures continually recur or are repeated. A pure repeater, or circulating decimal, is one in which the repetition goes on from the beginning; as, .3333 . . . 272727 . . . A mixed repeater is one in which the repetition does not begin till after the intervention of a figure or figures; as, .128888 . . . , .0113636 . . . etc. For the algebraic method of finding the value of a repeating decimal see PROGRESSION.

In firearms, an arm which may be caused to fire several successive shots without reloading, whether rifle, pistol or cannon. *In horology*, a watch or clock made to strike the time when a spring is pushed in. Some strike the hour and quarter, others the hour, quarter and odd minutes. *Nautically*, a vessel, usually a frigate, appointed to attend each admiral in a fleet, and to repeat every signal he makes, with which she immediately sails to the ship for which it is intended, or the whole length of the fleet when the signal is general; called also a repeating ship. *In telegraphy*, the same as relay.

REPEATING. See **BALLOT**.

REPENTANCE, or **CONTRITION**, as understood by divines, both Protestant and Catholic, is defined by the Council of Trent as "grief of mind and detestation of sin committed, with a purpose of sinning no more"; more specifically it is that sorrow for sin which arises out of consideration of God's goodness which sin has outraged, and which includes a resolution never more to offend God because God so deserves our love. This is the repentance called by Protestant divines "goodly sorrow." The same Protestant divines recognized a second kind of repentance, which mourns that sin is attended by a penalty rather than hates sin. This differs little from the "attrition" of Catholic divines, which is an imperfect sorrow for sin arising from such motives as fear of hell, loss of heaven, the turpitude of sin. Consult Psalms li, 4; Acts v, 31, xl, 18; 2 Timothy ii, 25; Matthew xxvii, 3-5.

REPLACEMENT. See **METASOMATISM**.

REPLEVIN, *rè-plèv'în* (French *replevin*, from Middle Latin *replivire*, to pledge), an action for the recovery of unlawfully possessed or detained goods or chattels. The action requires the issue of a writ for the seizure of the goods. To effect this the plaintiff must file a bond large enough to cover all probable resulting damage of the action to the defendant; or the latter may, in some cases, give bond and retain the possession of the contested goods until the case is settled. Should the plaintiff win the action he is entitled to the return of the goods, or, in case this be impossible, the payment of their value. In either case he is also entitled to damages for the retention of the goods. But should the plaintiff lose the action the defendant may recover damages and may sue for the same on the plaintiff's bond.

REPLICATION, from the Latin *replicatio* an answer, a reply. *In law*, the reply of the plaintiff to the defendant's plea.

REPLY TO HAYNE, The. The reply delivered by Daniel Webster of Massachusetts in the United States Senate 26-27 Jan. 1830 (to Senator Robert Y. Hayne, of South Carolina) was the culmination of a debate that arose over an unimportant resolution regarding the sale of the public lands, and grew to include sectional political issues. The oration may be divided into two sections. The first replies in detail to charges of political inconsistency which had been brought against New England and against Webster personally, and closes with glowing eulogy on Massachusetts. The second and more important section opposes the claim of South Carolina to the right of nullification and leads up to the famous peroration on the Union, closing "Union and Liberty, now as forever, one and inseparable." This last passage was for many years the best-known piece of American political oratory with the exception of Patrick Henry's "Give me liberty, give me death." The two impassioned outbursts, closing the two sections of the address, are, however, each but a paragraph in length. The greater part of the Reply, which occupies four hours in the delivery, is taken up with simple and direct reasoning, and while it gives the sense of great moral earnestness on the part of the speaker it contains no obvious appeal to the feelings of the hearers. Webster who according to tradition once said that his whole life had been a preparation for "Reply to Hayne," spoke almost extemporaneously, and the chief impression which his address produces is that of vast grasp of all widely different matters on which he touched. There were two sides to the questions under discussion, as there always are, but to many of his hearers he seemed to have annihilated the arguments of his opponent. In a private letter Webster once referred somewhat oddly to the Reply as "No. 1 among my political efforts" and to the Seventh of March Speech as "probably the most important effort of my life." It was an almost unanimous verdict of his admirers, many of whom disagreed with the political sentiments of the Seventh of March Speech, to give the highest rank to the Reply to Hayne.

REPORTING. See JOURNALISM; NEWS-PAPERS, AMERICAN.

REPOUSSÉ, *rə-pōō'sā'*. A term taken from the French, meaning "beaten back." It is used to designate the formation of raised (*relief*) ornament in metal on flat or hollow ware. In its stricter interpretation the term refers to that division of beaten relief work which is performed by hammering or punching on the reverse (negative) side of the metal. This is, therefore, embossing as contradistinguished from *chasing*, which latter process is the hammering or driving of the metal into recesses (*depressing*). Inasmuch as the relief ornament is, almost invariably, followed by a finishing process of chasing, the entire performance (of relief and intaglio work on a single piece) is, by extension, frequently termed *repoussé* work. The great esteem in which *repoussé* work of fine character is held by connoisseurs is enhanced by the knowledge that the quality of the production depends solely on the skill of the craftsman. The art dates back to very early history, and the ancients did very refined, delicate work in this process, as is proven by such examples as the Bernay Treasure (see SILVERWARE) and other finds of silver, gold and bronze art metal work (see BRONZES). To the Greeks the process was known as *sphyrallaton*. *Repoussé* work is about the most difficult the craftsman in metal can undertake, requiring great skill and patience to obtain fine execution, and for this very reason the great gold and silversmiths of all times have loved to display their skill in this medium; Greeks, Romans, Italians, Dutch, French and Germans have all left us grand examples. The golden altar in Cluny Museum, Paris (see ALTAR), is a beautiful 11th century example of *repoussé* work.

Technique.—As above stated, this process consists of hammering or punching embossed work from the reverse side. In efficient work the whole surface, both the relief and the background, should remain of equal thickness as near as possible. This involves hammering up the metal sheet (termed blank) to thicken, or reinforce, the parts which are to be in relief, so that, while covering a larger surface than the flat, the thickness of the "walls" may be maintained. Another chief difficulty to overcome is the fact that hammering on the metal tends to harden and cause "temper" or brittleness. A frequent "annealing" is, therefore, necessary. Annealing is the softening process brought about by bringing the metal to red heat, then "quenching" in "pickle" or water. In the case of copper the quenching can be done at red heat, but with brass or silver the metal should cool down somewhat. The first process in producing *repoussé* work is to get a copy of the required design on to the metal; for which there are several processes, but the simple methods of pasting the drawing on the metal or tracing it on to the surface with carbon paper and stylus, or a needle point, are commonly used for flat work. For hollow ware surfaces the work has to be done by freehand generally, using "dividers" for tracing the measurements. In the case of flat work, the blank is placed face downward, the design being on the reverse side, on a board which is faced with a composition which will yield to the blows of the tool yet

maintain the surrounding surface to support the remainder of the metal. Usually a composition is used containing pitch (Stockholm or Swedish preferred) mixed with tallow or some other substance to soften it and overcome its tendency to brittleness; brickdust, plaster of Paris or resin are often used for this purpose. In high relief work the pitch must be kept warm so as to be sufficiently soft to take on deep impressions. But, in order to avoid the inconveniences of working on such a soft, sticky substance, lead, tin or zinc are frequently used to support the metal that is to be hammered into high relief. For surfaces which are not in the flat a "pitch bowl and ring" are used as support. A hemispherical bowl filled with the pitch is rested on a thick ring of leather, rope or other substance. This contrivance permits the worker to tilt the surface in any desired direction.

Tools.—At least two hammers are needed, one with flat face, the other a "chasing" hammer with handle ending bulb-shaped; a wooden mallet can take the place of the latter. Punches and several kinds of chasing tools should be numerous if it is desired to avoid monotonous effects; a "tracer" and a "back grounding" tool are needed, and, to ease operations, at least 50 different punches are required (which are best shaped by the individual worker). Bossing and "cushion" tools vary in form (but the edges must be eliminated) and are used to produce bosses or ridges. "Modelling" and "chasing" tools have a flatter working end; "lining," "freezing" and "matting" tools are used to produce "texture" on the surface and contain working surfaces in lines, grooves, hatchings, etc. "Ring" tools produce a depressed circular mark; "backgrounding" tools, of course, are for giving background texture. "Snarling irons" are for working in the interior of hollow ware (such as ewers, vases, etc.) and are made in elongated Z shape; they are fastened at one end in a vice the other end (which is provided with a knob or button) is inserted in the orifice of the hollow piece, pressing against the surface to be operated on. A blow of the hammer on the tool near the vice sets the free end in vibration whose percussion produces on the inside of the vessel a depression, therefore a corresponding embossing effect on the outer (positive) surface. Consult Gawthorp, 'A Manual of Practical Instruction in the Art of Brass Repoussé Work for Amateurs' (London 1899); Horth, A. C., 'Repoussé Metalwork: a Scheme of Sheet Metal Work for Schools and Amateurs' (London 1905); Maryon, H., 'Metal Work and Enamelling' (London 1912).

REPPLIER, *rəp'lēr*, Agnes, American essayist: b. Philadelphia, Pa., 1 April 1855. She is of French descent and was educated at the convent of the Sacred Heart, Torresdale. Her essays are characterized by lightness of touch, a keen sense of the humorous side of a theme and not a little irony. She published 'Books and Men' (1888); 'Points of View' (1892); 'In the Dozy Hours' (1894); 'Essays in Idleness' (1893); 'Essays in Miniature' (1892); 'Varia' (1897); and 'Philadelphia: the Place and the People' (1898); 'The Fireside Sphinx'

(1901); 'Compromises' (1904); 'In Our Convent Days' (1905); 'A Happy Half Century' (1908); 'Americans and Others' and 'The Cat' (1912), etc. She also compiled a 'Book of Famous Verse' (1892), and was a contributor to the *Saturday Evening Post*.

REPRESENTATION. See MINORITY AND PROPORTIONAL REPRESENTATION.

REPRESENTATION, (1) the authorized acting by one person in behalf of another, as in a legislative assembly; also, the system of choosing such representatives. Representation in a modified form was known in ancient times, and the principle was extended by the Church, in its ecumenical councils. The Germanic nations, however, were the first to adopt political representation, having employed it in their popular assemblies. Later it spread to Great Britain and still later to the United States, in which latter country it developed into the representative democracy which still endures. Representation to-day is found not only in republics, as the United States, but in monarchies also, as Great Britain. In republics, however, representatives are less restricted in their power than in monarchies, it being usual in the latter to place a check in the form of an appointed or hereditary upper house to control legislation. In early times representation was largely by classes, and to-day this principle is still carried out to some extent in England. There is much conflict of opinion as to whether a national representative should follow closely the wishes of his constituents solely or whether he should, in case of conflicting interests, prefer to use his powers in a manner that would most benefit the entire country. The latter view appears to dominate, but it is nevertheless a fact that representatives, especially those seeking re-election, are largely influenced by the wishes of their constituency.

Majority, Minority and Proportional Representation.—In the United States the majority generally rules, and no provision is usually made for giving the proportionate representation to the minority that it would seem in all justice to require. It often happens, owing to the system of representation in vogue in the United States, that a party which casts less than 40 per cent of the votes in a Congressional or other election may have all the representation while the parties casting the remainder of the votes have no representation whatever. In Illinois an attempt was made to remedy this by the constitution of 1870, which provided for what is known as the "free vote." This system, as applied in this State, affects the election of members of the lower house of the legislature only, and by the provisions of the constitution each voter may cast as many votes for each candidate as there are representatives to be elected or he may apportion such votes, or equal parts thereof, among the candidates, if he so desires, and those receiving the largest number of votes shall be elected, three representatives being chosen in each district. The chief objection to this method is that at best it gives only minority and not proportional representation, gives it solely to a very large minority and ignores third parties entirely. Another objection is that the politicians of the two leading

parties have rendered the regulation practically valueless by manipulation in naming the candidates. For instances, in districts largely Democratic, the Democratic party makes but two nominations and the Republicans one, thus ensuring the election of two Democrats and one Republican in a very large preponderance of cases. Another method advocated for the reform of present methods is known as the "limited vote," which has been used in England, and also in Pennsylvania in choosing Supreme Court judges, county auditors and other officials and in New York for the selecting of members at large to the Constitutional Convention of 1867. By this method each voter has less votes than there are offices to be filled. For example, where there are three offices, the voter has only two votes. This method, in a modified form, is in effect in a number of countries, among them Portugal and Spain. Another method, known as the "transferable vote" or "Hare system," is complicated but much favored by advocates of the minority system. By this method a voter indicates his choice (1st, 2d, etc.) by number, after voting for as many candidates as he desires. The total number of votes cast is divided by the number of offices to be filled, and the quotient gives the "quota," or number of votes necessary to elect a candidate. At the first count of votes, only the first choices are reckoned and those that receive at least a quota are declared elected. After this, if all the offices are not filled, the remaining votes of the candidates who have been declared are transferred to the candidate having second choice, and the process is continued until all the offices are filled. Tasmania adopted this method, for all elections in 1907, and it is in use also in Moravia, Denmark and Iceland. Another method, in use in Switzerland and elsewhere in Europe, is known as the "free-list" system. Under it any organized party may nominate as many candidates as it desires, but not to exceed the total number of places to be filled. Any voter may cast as many votes as there are candidates to be elected, but not more than one for any candidate. The total vote cast is then divided by the number of places to be filled, and this gives the quota of representation. The total vote cast by each party divided by this quota gives the number of representatives to which each party is entitled. For example, if 20 representatives are to be elected, with 1,000,000 voters in the district, the Democrats polling 400,000, the Republicans 350,000 and the Socialists 250,000, the quota is found by dividing the total votes cast (1,000,000) by the number of representatives to be chosen (20), equalling 50,000. This would give the Democrats eight representatives, the Republicans seven and the Socialists five. Other systems are in use which are modifications of those above described.

(2) *In law*, an oral or written statement of fact, as one made incidentally or collaterally to a contract. Whether express or implied, material false representation made by one party to a contract, if acted upon and believed by the other party to his injury, will render such contract void; (3) the principle by which the line descendants of a deceased person inherit or take part of the estate which their ancestor would have inherited if he had survived.

REPRESENTATIVE GOVERNMENT.

Representative government in the modern meaning of the term was unknown to the ancients. Kings, chiefs and administrative officers were often elected by popular vote or acclamation, but neither in ancient Greece nor Rome did a body exist even remotely resembling a Congress, a Parliament or a Reichstag. States which were not absolute despotisms were governed, as a rule, by a council of magistrates and a popular assembly, in which latter all persons with civic rights took part, and which was very much like a New England town meeting; but there is no instance of the popular assembly of ancient times developing into a representative body. The Roman Senate was composed of magistrates and ex-magistrates and resembled the American Senate of to-day only in name. This ancient system, which appears from the standpoint of to-day both unwieldy and unruly, was well enough fitted, however, for the so-called republics in which it prevailed, and in which all power was reserved to the central city, whether Athens, Thebes or Rome. The citizens in public assembly stood for the state, and were the state, and did not think it necessary to delegate their powers to representatives. When civic rule in Rome gave place to imperialism, the public assembly ceased to exist, while the Senate was retained to register the decrees of the Cæsars, and offer honorable retirement to those who had gained imperial favor.

Representative government, as we know it to-day, is not derived, therefore, from any Roman or Greek institution. It is essentially an outgrowth of that love of liberty inherent alike in Saxon, Norman and Celt, and reached its present development through centuries of struggle and of political and social evolution. The English Parliament, with its combination of mediæval House of Lords and 20th century House of Commons, has grown gradually from beginnings dating back almost to the Norman Conquest. The barons asserted their rights against tyrannical kings, and the necessities of the kings compelled them to recognize the well-to-do classes outside the nobility, who had the wealth of which the royal exchequer stood badly in need. Taxation gave birth to representation, and at length it became a recognized principle that Englishmen would not stand taxation imposed without their own consent through representatives in Parliament assembled. It was not, however, until far into the 19th century that the common people of England were permitted to have a voice in public affairs, and not until 1885 that the suffrage was bestowed on virtually all male subjects of adult age in the United Kingdom. The Parliament of to-day, therefore, represents the English people; less than half a century ago it represented only the privileged classes.

Representative government in the United States inherited its spirit from England, but not its form. The American system is of native origin. It developed from town-meeting to assembly, and when the new States adopted new fundamental laws, the upper house was called a senate, after the ancient Roman Senate, while the right of originating measures of taxation was reserved to the popular branch of the legislature. In the United States, also, however, the right or privilege of voting was generally restricted to taxpayers and property-owners

for many years after independence, and in one of the States—Rhode Island—a landholding qualification for foreign-born citizens existed until a few years ago. Excepting some peculiar restriction intended to prevent negroes from voting in certain Southern States, nearly all male citizens of adult age now possess the right to vote. The second decade of the 20th century saw the extension of the suffrage to women in many States of the Union and the passage of the Federal amendment to the Constitution, in 1918, by which all women in the United States are enfranchised ends the long struggle in other States and confers the voting power on millions, making for a really representative government. See **SUFFRAGE**.

In the Hanseatic towns, in Switzerland, the Italian free cities, and other republics of the Middle Ages, representative government had no real existence so far as the common people were concerned, and the parliaments of modern Europe are not derived from the institutions of those states. The American Revolution gave the impulse and inspiration needed to awaken the people of Europe to a sense of their rights and wrongs and the constitutions granted by monarchs on the Continent to their subjects adopted as models a mixture of the English and American systems. Every European country at present has a congress or parliament in which the people are represented by deputies elected according to law. Japan has a similar system, and representative government, which 100 years ago was practically confined to the United States and England, is now coextensive with civilization in every continent. See **DEMOCRACY**; **GOVERNMENT**; and consult Beard, Charles A., 'American Government and Politics' (New York 1910); Commons, John R., 'Proportional Representation' (2d ed., ib. 1907); Garner, J. W., 'Introduction to Political Science' (1910); McLaughlin, A. C., and Hart, A. B., 'Cyclopedia of American Government' (3 vols., New York 1914); Stubbs, W., 'Constitutional History of England' (London 1897).

REPRESENTATIVES, Election of. See **ELECTIONS**; **ELECTORAL QUALIFICATIONS**; **CONGRESS**.

REPRESENTATIVES, House of. See **HOUSE OF REPRESENTATIVES**; **CONGRESS OF THE UNITED STATES**; **SENATE, UNITED STATES**; **ASSEMBLY, LEGISLATIVE**; **LEGISLATURE**.

REPRESENTATIVES, State. See **ELECTORAL QUALIFICATIONS**.

REPRIEVE, in law, a temporary suspension of the execution of a sentence after conviction of a crime, as by a governor or a sovereign; also, the instrument granting such suspension. The term to-day is usually applied with reference to sentences of death only. Reprieves are usually granted by the chief executive of a nation or state, among some of the reasons being: newly-discovered evidence affecting favorably the case of the condemned, pregnancy, insanity occurring after sentence of death and to allow time for the determination of facts after a pardon has been requested. Sometimes the court which tried the prisoner may grant a reprieve.

REPRISALS, in international law, (1) forcible seizure and retention of the goods of an enemy in retaliation or as satisfaction.

While it is an act of war, it is usually resorted to for the purpose of avoiding war and is always accompanied by force, as by the seizure of property. Sometimes naval forces are landed on territory of the offending nation and the custom-house and other public buildings are taken and held until satisfaction has been secured. Compensation should first be demanded by a state before resort is had to reprisal. (2) A retaking of one's own property by force.

REPROACHES, or **IMPROPERIA** (a Latin word of the same meaning), in the Roman Missal, a part of the divine service which on Good Friday is substituted for the usual daily mass. While the clergy and people are paying veneration to the representation of the Crucified before the high altar, two pairs of choristers chant alternately a series of antiphons, to which two choruses respond in versicles, Greek and Latin alternately, then repeating part of the antiphon. There are 12 Improperia, the first being: "My people, what have I done to thee? or wherein have I vexed thee? For that I led thee out of the land of Egypt, thou hast provided a cross for thy Saviour." Again: "I lifted thee up with mighty power; and thou hast hanged me on the gibbet of the cross." These reproaches were first sung to plain-chant melodies, preserved in the 'Graduale Romanum,' and still extensively used, but in the Sistine Chapel, since 1560 they have been sung to some exquisite "faux bourdons," to which they were adopted by Palestrina.

REPROBATION, a dogma of the Calvinistic creeds, which teaches the predestination of some of the children of Adam to be eternally lost. Though the word reprobation is not used in the Westminster Confession of Faith and does not occur in the Authorized Version or Revised Version, the definite reprobation of those who are not predestinated to everlasting life is unequivocally expressed in this passage of the Confession (iii, 7): "The rest of mankind"—that is, all but the elect to everlasting happiness—"God was pleased, according to the unsearchable counsel of his own will, whereby he extendeth or withholdeth mercy as he pleaseth, for the glory of his sovereign power over his creatures to pass by and to ordain them to dishonour and wrath for their sin, to the praise of his glorious grace." Among the passages of the New Testament that are cited in support of this doctrine are Rom. ix, 11-22; 1 Thess. v, 9; 1 Pet. ii, 8; Jude 4.

REPRODUCTIVE ORGANS. See **ANATOMY, COMPARATIVE.**

REPTILES, or **REPTILIA**, a class of vertebrate animals. Although no two groups of *Vertebrata* are more dissimilar in general appearance and habits, and to the popular mind might seem more unrelated than the birds and reptiles, they are, by common consent of modern systematists, combined in a superclass, the *Sauropsida*, of Huxley, or the *Monocondylia*, of Haeckel and Cope. The *Sauropsida* are distinguished by the possession of lungs, gills being permanently absent. The embryo possesses an amnion and allantois, the former being a sac investing the body, the latter a structure developed from the lower surface of the embryo and serving for respiration. The lower jaw in *Sauropsida* is compound in that each half or

ramus consists of a number of distinct pieces; while in mammals each half consists of but a single piece. The lower jaw in reptiles and birds further articulates with the skull, not directly, but through the intervention of a separate and distinct bone, the os quadratum or quadrate bone. The skull is joined to the spine by one condyle only; two such condyles exist in amphibians and mammals. As compared with the fishes and batrachians the basal axis of the brain-case is bony instead of cartilaginous and the parasphenoid bone is absent. The bodies of the vertebræ are formed chiefly of centra (that is, are gastrocentrous) instead of intercentra (notocentrous) as in the *Amphibia*. Very rarely and only in extinct forms is the notochord persistent. The anklejoint is placed in *Sauropsida*, not as in mammals, between the tibia and the astragalus, but between the proximal and distal parts of the tarsus which in *Sauropsida* becomes thus divided. The coracoid bone is almost always well developed. The intestine ends in a cloaca. No complete diaphragm is developed to separate the thorax from the abdominal cavity. The corpus callosum uniting the halves or hemispheres of the cerebrum is rudimentary, no mammary glands exist and the *Sauropsida* are oviparous or ovo-viviparous. Such are the characters common to birds and reptiles.

Comparison with Birds.—Reptiles differ from birds in the following characters, which may, therefore, be taken as including the definition of the class *Reptilia*. The covering consists of horny scales or of bony plates (scutes), but never of feathers. The blood is cold and two aortic arches (right and left) exist in living *Reptilia*. The heart is three chambered in all save the crocodiles, which possess a four-chambered heart. But in all reptiles, without exception, the venous and arterial currents of blood are connected and an impure or mixed blood is thus circulated throughout the body. The lungs do not present the open character of those of birds, but, like those of *mammalia*, are in modern reptiles almost always closed sacs. The tarsal and metatarsal bones of the hind limbs, which in birds are united to form a single bone, are distinct and separate in the great majority of reptiles. When a sacrum exists it bears sacral ribs, which articulate with the ilia or haunch-bones.

Skeleton.—The body in reptiles is generally elongated, the tortoises and their allies presenting the most notable exceptions to this rule. The limbs may be entirely wanting, as in most snakes and in many lizards; or only a pair of limbs may be developed, as in some lizards, while in most other reptiles all four members are present. The bones of reptiles are more compact than those of lower vertebrates. In the reptilian skeleton the five different regions into which the spine is ordinarily divided are to be recognized, except in the serpents and a few others. There are seldom more than two sacral vertebræ, and free cervical ribs are usually present. The epiphysial and other suture of the vertebræ are retained through life. The bones of the shoulder-girdle of each side include a simple or divided scapula or shoulder blade and an often complex coracoid bone, including precoracoid and epicoracoid, the latter bone of each side articulating with the sternum or breast-bone when the latter is present.

In addition a clavicle and interclavicle may be present. The fore-limbs consist each of a humerus, radius and ulna, the carpal bones and normally five digits. The pelvis contains its three typical elements, ilium, ischium and pubis, the first being often of larger size and the last usually forming a symphysis. In serpents the shoulder-girdle is totally absent and vestiges of the pelvic-girdle appear only in a few instances; and in the turtles both are enclosed within the shell, except that the clavicle and interclavicle form part of the plastron. The limbs are usually adapted for running, but sometimes for leaping and in the extinct pterodactyls for flight. In the extinct marine pelagic reptiles, and in the modern sea-turtles, they are paddle-like. The ribs in reptiles are always present, but may differ greatly in form and disposition, those of the turtles, for example, contributing toward the formation of the upper shell or carapace.

Skull.—The skull of *Reptilia* possesses but a single occipital condyle, which is sometimes tripartite. The quadrate bone is generally firmly fixed to the skull, joining the squamosal bone, but is freely movable in serpents and only less so in many lizards. Each half or ramus of the lower jaw is composed of dentary, angular, surangular, coronoid, splenial and articular bone. Other regions of the skull are modified in the greatest varieties of ways in the several orders, the most important from a systematic standpoint being in the bones which form the complex roof of the temporal fossa. Primitively this roof is complete as in the stegocephalian-batrachians, but by the formation of one or two openings (supra- and infra-temporal vacuities) it is divided into one (*Synapsida*) or two (*Diapsida*) longitudinal bars behind the orbits. Through variations in the size and position of these openings, to which may be added emarginations, this region is modified, and may even practically disappear altogether, as in the snakes.

Digestive Organs.—The teeth are generally well developed, but in the *Chelonia* are wanting, the jaws, like those of birds, being ensheathed in horn. The reptilian teeth, like those of lower *Vertebrata* generally, are adapted less for mastication than for merely retaining prey while it is being swallowed. Save in the crocodiles and in some extinct forms the teeth are not implanted in sockets or *alveoli*, but are attached in various ways and by bony union to the jaw-bones. Teeth may be borne by bones other than the jaws (for example, palate bones); and, as seen in the poison-fangs of serpents, may be modified for special purposes. The teeth vary greatly in number and are not persistent, new teeth being produced in regular order (as in crocodiles) from a growing pulp at the base of the socket, the new tooth displacing the old.

The tongue may be elongated, distensible and bifid, as in many lizards and serpents; short, thick and non-protrusible, as in other lizards; or completely attached and fixed throughout its entire extent, as in *Crocodylia*. The oesophagus or gullet is usually greatly distensible (as in serpents), and may be covered (as in some *Chelonia*) with retroverted spines. The stomach is mostly pyriform or pear-shaped, and (as in snakes) may, like the gullet, be capable of great distension. In *Ophidia* it exhibits an anterior dilated part, with

thin walls for receiving nutriment, and a posterior hinder portion with non-distensible walls provided with glands and adapted for digesting the food. In the crocodile the stomach resembles the gizzard of a grain-eating bird in its high muscularity.

Circulation.—The heart in reptiles consists of two auricles (right and left) and a ventricle, except in the *Crocodylia*, in which two auricles and two ventricles are developed. The aortæ or main arterial trunks exist, and are respectively named right and left aorta. These chief vessels bend around the gullet and unite to form a single and common main-trunk for the supply of blood to the system generally. But the chief peculiarity in the circulation of all reptiles consists in the peculiar mixture of arterial with venous blood, which takes place in the aorta in such a manner that the head alone is supplied with arterial blood. The reptiles exhibit sluggish habits, slow respiration and a series of vital actions marked by no active conditions demanding a more perfect circulation or highly-oxygenated blood. The blood is cold (poikilothermic) in reptiles, that is, but little higher in temperature than the surrounding medium, with changes in which it varies. The red blood-corpuscles are oval and nucleated.

Respiration in reptiles is carried on solely by means of lungs, the presence of branchiæ or gills in early life, and sometimes in the adult life also of batrachians, constituting a marked difference between these latter and reptilian forms. In the *Crocodylia*, *Chelonia* and most lizards, the lungs are equally developed, but in serpents and some lizards only one lung is fully developed, the right lung being usually abortive. The lungs may, as in snakes and other *Reptilia*, in which the body is elongated, be of proportionally large size, and may extend nearly throughout the whole length of the body-cavity which is not separated by a complete diaphragm into a distinct thorax and abdomen. In the crocodiles, lizards and serpents the respiratory action is carried on through movements of the walls of the trunks. But in turtles, in which no movements can take place, air is drawn into the lungs by a process analogous to swallowing. The larynx or organ of voice is simple in structure, no vocal cords being in general developed, although these organs appear in crocodiles and some others.

Brain and Sense-Organs.—In the higher *Reptilia* the cerebrum attains a comparatively larger size than in the lower forms, while the cerebellum also attains a relatively higher development as we proceed upward. The cerebellum has no lateral lobes nor pons, while the corpora bigemina and thalami are of large size. The senses are developed in tolerable perfection. The nasal cavities are of large size and open into the mouth through either the anterior or posterior part of the palate. In the *Crocodylia* the hinder nostrils open very far back in the mouth, enabling these animals to hold their prey under water in their mouths, and so to drown it, while their own respiration is carried on unimpeded through the nostrils. The eyes are usually of small size, and exhibit variations in structure and in the disposition of the protective coverings. Thus in snakes the eye-ball in front is covered by a transparent lid, formed by a layer of the skin, which is attached to a circle of surrounding scales, and is shed periodically,

with the outer skin. In snakes the pupil of the eye is round. In the lizards movable and ordinary eyelids exist, while the turtles possess a nictitating membrane. In lizards and snakes the sclerotic coat of the eye is strengthened by a circle of bony plates, such as also occur in several extinct reptilian forms and in birds. In the chameleons the single eyelid is formed by the united lids, and through an opening in this circular lid the rays of light enter the pupil of the eye within. The tympanum of the ear is imperfectly developed in *Ophidia*, and no eustachian tube exists. In lizards the tympanic apparatus is better developed, while in chelonians the tympanic cavity is large and complicated, and a rudimentary cochlea exists. The *Crocodylia* possess a movable valve, by means of which the tympanic canal of each ear can be closed at will; and most of the structures found in the ear of higher *Vertebrata* are represented in greater or less structural detail and perfection.

Viscera.—The kidneys are generally placed far back and deep within the pelvic cavity. In the serpents, however, the kidneys are situated anteriorly, and are unsymmetrically placed, the right being higher up and in advance of the left kidney; they also are divided into small lobes. No urinary bladder exists, and the urine of the lizards is fluid; that of the serpents resemble the excrement of birds in being pasty and crystalline. In *Crocodylia* the testes are elongated, and placed in front of the kidneys. The penis in *Crocodylia* is single, grooved and contained within a special cloacal fold; in *Ophidia* two lateral penes exist, and these are hollow and evertible; a double penis exists in lizards, while that of turtles is single.

The eggs are generally of relatively large size, and provided with a thick parchment-like shell and a large yolk. In many instances the eggs may be deposited in sand and hatched by the sun's heat.

Distribution.—With regard to the distribution in space of reptiles, the warm or tropical regions of the earth contain these animals not only in greatest number, but in most typical form and variety. During winter or in the colder seasons of the year, most reptiles hibernate and many desert species also pass into a summer sleep. Reptiles are varied in their habits, most of them being terrestrial, but many arboreal and some, including the great majority of the turtles, are aquatic. While most are strictly carnivorous or insectivorous, some subsist on a general diet and a few are purely vegetarian. Many of the extinct forms fed exclusively on fishes. Reptiles exhibit many interesting habits, but, owing to a popular prejudice against them and the tax on the patience of the observer resulting from their inactivity and secretiveness, they have been comparatively little studied.

Classification.—Because of certain resemblances in form and manners, all of the early zoologists, to and including Cuvier, classed the *Reptilia* and *Amphibia* together, and it was only when embryological data began to play an important part in taxonomy that their dissimilarity was perceived. Milne-Edwards and his contemporaries toward the middle of the 19th century were the first to recognize this in a scheme of classification. In 1860-70 when

zoologists were still working under the fresh stimulus of the publication of the 'Origin of Species,' Huxley, Haeckel and Cope almost simultaneously perceived much more clearly than had any of their predecessors the close relationship and probable community of descent of birds and reptiles. Reptilian life played a much more important rôle in past ages of the earth than now, that it is not surprising that we must turn to palæontologists for nearly all of the recent advances in the classification of the groups. The scheme and nomenclature mainly followed in this work is that elaborated by Gadow in Vol. VIII of the 'Cambridge Natural History.'

CLASS REPTILIA.

Subclass *Proreptilia*.

Subclass *Prosauria*. Orders: Microsauri, Prosauri (Rhynchocephalia, etc.).

Subclass *Theromorpha*. Orders: Pareiasauri, Theriodontia, Placodontia, Anomodontia.

Subclass *Chelonía* (Turtles). Orders: Atheca, Thecophora.

Subclass *Dinosauria* (Dinosaurs). Orders: Sauropoda, Theropoda, Orthopoda, Ceratopsia.

Subclass *Crocodylia* (Crocodylians). Orders: Pseudosuchia, Parasuchia, Eusuchia.

Subclass *Plesiosauria*. Orders: Nothosauri, Plesiosauri.

Subclass *Ichthyosauria*. Orders: Ichthyosauri (Fish-lizards).

Subclass *Pterosauria* (Flying Reptiles). Order: Pterosauri (Pterodactyls).

Subclass *Pythonomorpha*, Orders: Dolichosauri, Mosasauri.

Subclass *Sauria*. Orders: Lacetilia (Lizards); Ophidia (Serpents).

A more elaborate scheme, but one which more correctly expresses the natural relationships of the orders, has been developed by Cope, Baur and Osborn.

The vast majority of reptilian types have become extinct. Only four orders are represented in our modern fauna, and one of these, the *Rhynchocephalia*, by only a single species, the New Zealand tuatara. The *Crocodylia* have greatly declined in variety of forms since the close of the Mesozoic Age. The *Pythonomorpha* have become extinct, but lizards and snakes are represented in the saurian orders by a great number of species and are the only dominant reptilian types. Reptiles flourished especially during the Mesozoic Age, to which four of the most remarkable groups were confined, the great marine reptiles (*Plesiosauria* and *Ichthyosauria*), the huge and often remarkably modified terrestrial *Dinosauria* and the equally wonderful flying *Pterosauria*. This epoch, when the seas were shrinking and dry land increasing in extent, but when the atmosphere was heavy with moisture and carbonic-acid gas, unfitted for the respiration of high types of life, was well suited for the development of the sluggish reptiles; and they were dominant on land and sea, replacing on the one hand the amphibians and on the other the primitive types of fishes of earlier ages. With the close of the Age of Reptiles and the advent of the Eocene Period, mammals quickly rose to full dominance on the land and many orders of reptiles, having played their parts in the evolution of life, disappeared forever. Reptile

sprang from the stegocephalian *Amphibia*. From some group of the *Theromorpha* (of the synapsidan series) mammals are supposed to have come; while birds took their origin from the diapsidan line, probably in common with some primitive dinosaurian.

Consult, besides the numerous articles in this work on special orders and kinds of reptiles, the following: Cope, 'The Crocodilians, Lizards and Snakes of North America,' Report of United States National Museum (Washington 1900); Holbrook, 'North American Herpetology' (Philadelphia 1842); Gadow, 'Amphibia and Reptiles' (New York 1901); Boulenger, 'Catalogue of the Reptiles in the British Museum' (London 1889-96); Osborn, 'The Reptilian Subclasses Diapsida and Synapsida,' Memoirs American Museum of Natural History (New York 1903); Woodward, 'Vertebrate Paleontology' (Cambridge 1898).

University of Pennsylvania.

REPTILES, Eggs of. See EGG.

REPTON, a village of Derbyshire, England, about eight miles southwest of Derby; it was once an Episcopal see, capital of the kingdom of Mercia and had a celebrated nunnery from 660 till its destruction by the Northmen in 874. From 1172 till the dissolution of the monasteries under Henry VIII it was the seat of a priory of Austin friars; part of the priory buildings is incorporated in the fabric of the Repton free grammar school, founded in 1556, one of the great English public schools. The parish church of Saint Wystan is notable for its curious crypt, consisting of a centre and side isles divided by three arches on either side and supposed to date from the reign of Edgar. Pop. 1,695.

REPUBLIC, a word signifying a state in which the people are the source of power. The degree of popular sovereignty in republics has varied very widely in the past, most of the so-called republics having been ruled by an aristocracy which jealously guarded its own rights, but treated the multitude as little better than slaves. Real republican government may be said to date from the American Declaration of Independence, and even in the United States the government was largely one of class until about the second quarter of the 19th century, when suffrage barriers began to break down. The other so-called American republics have been so far mostly military despotisms, in which order or disorder was maintained by force under the command of a successful general. But the force of true republicanism has been slowly growing in all the ancient Spanish possessions. Argentina, Chile and Brazil are also gradually becoming inspired by the real republican spirit, while Cuba, the youngest of American republics except Panama, which has just been admitted to the family of nations, is making an excellent record.

As an instance of the way in which the term "republic" was used or abused in the past, it may be mentioned that Poland was formerly called a republic because the king was elected by the nobles. In the 18th century it was not uncommon to designate the German Empire by the appellation of the "republic of princes." The large commercial cities of Italy, Genoa and Venice were called republics because they were

governed by an aristocracy of noble families, who appointed one of their number to be supreme chief of the state, as the *doge*. The republican institutions of the greater part of the Greek states, as well as that of Rome, at least in later times, were of a more democratic character.

Of the tiny republics of the world San Marino is the best known. It is situated in central Italy, and its territory covers about 33 square miles and the population numbers about 8,500 souls. This miniature state was founded in the 4th century by Saint Marinus, who, having embraced Christianity, fled there to escape the persecution under Diocletian. The capital, San Marino, is on the crest of a mountain over 2,000 feet high and has a population of 1,200. It is one of the most picturesque places in the world, being perched on perpendicular cliffs.

The small half French and half Spanish republic of Andorra, which lies in an almost inaccessible valley of the eastern Pyrenees, possesses a charter of rights dating from Charlemagne in 790. See FREE CITIES; SAN MARINO; ANDORRA; REPUBLICS, THE HISTORY OF; REPUBLICS, DURATION OF; DEMOCRACY; GOVERNMENT; CONSTITUTION OF THE UNITED STATES.

REPUBLICAN, the river which unites with Smoky Hill River, at Junction City, Kan., to form the Kansas River. The Republican is formed by two streams which unite in east central Colorado. The river flows northeast into Nebraska, then east and southwest, entering Kansas at Superior in Jewell County, continuing south, east and southeast to the Kansas River, uniting with that stream in Gary County, about three miles below Junction City; estimated length, 550 miles.

REPUBLICAN PARTY, The. The Republican party was an inevitable outgrowth of the conditions which prevailed about the time of the repeal of the Missouri Compromise in 1854. The Whigs, incapable of grappling with new problems, were rapidly disintegrating; no one of the sporadic parties sprouting in the political confusion of the time was based on broad enough principles to become a truly national organization; the Republican party, germinating in the Free Soil movement and inheriting Whig and Federalist traditions, happily combined the inspiration of a great moral idea with the enduring quality of sane policies in Federal administration. Its origin cannot properly be ascribed to any particular date or place. The first known suggestion of the name was in a letter written by Horace Greeley. The earliest convention of importance to adopt it was held at Jackson, Mich., 6 July 1854. Virtually coincident with the Michigan convention there were conventions in Maine, Illinois, Massachusetts, Ohio, Indiana, Wisconsin and Iowa; almost spontaneously the Republican party had become a strong national organization. On the roster of the 33d Congress, the name "Republican" does not appear; in the 34th Congress, which met 3 Dec. 1855, there were in the Senate 15 Republicans, 42 Democrats and 5 Americans; in the House of Representatives there were 108 Republicans, 83 Democrats and 45 Americans. The Whigs had disappeared. Nathaniel P. Banks of Massachusetts was chosen speaker of the House by a combination of Republicans and Americans,

after a memorable contest. Steps were taken at once to put a ticket in the field for the approaching election of President. The chairmen of the State committees of Maine, Vermont, Massachusetts, New York, Pennsylvania, Ohio, Michigan, Indiana and Wisconsin called an informal convention to meet at Pittsburgh, 22 Feb. 1856. A committee appointed at that meeting called a national convention to meet at Philadelphia, 17 June 1856, to nominate candidates for President and Vice-President. The call was addressed to "the people of the United States, without regard to past political differences or divisions, who are opposed to the repeal of the Missouri Compromise, to the policy of the present administration, to the extension of slavery into the Territories, in favor of the admission of Kansas as a free State, and of restoring the action of the Federal government to the principles of Washington and Jefferson." John C. Fremont, of California, was nominated for President, and William L. Dayton, of New Jersey, for Vice-President, on a platform the most conspicuous plank of which read as follows:

"Resolved, That the Constitution confers upon Congress sovereign power over the territories of the United States for their government and that in the exercise of this power it is both the right and the imperative duty of Congress to prohibit in the territories those twin relics of barbarism, polygamy and slavery."

It was essentially a one-idea convention, although resolutions were adopted favoring national aid for a railway to the Pacific Coast, and liberal appropriations for rivers and harbors; but the party was not long to remain thus limited in its mission. The convention of 1860, which nominated Abraham Lincoln for President, adopted resolutions which committed the new party to the doctrine of a protective tariff, in the following clause:

"That, while providing revenue for the support of the general government by duties upon imports, sound policy requires such an adjustment of these imports as to encourage the development of the industrial interests of the whole country; and we commend that policy of national exchanges which secures to the workmen liberal wages, to agriculture remunerative prices, to mechanics and manufacturers an adequate reward for their skill, labor, and enterprise, and to the nation commercial prosperity and independence."

The Republican party is thus seen almost from the beginning to have been committed to the protective policy which remains to-day one of its cardinal principles. The election of 1856 resulted in a Democratic victory. James Buchanan received 174 electoral votes; Fremont received 114. It is perhaps fortunate that the new party did not then meet with success. Their candidate was a popular hero. No better name could have been selected about which to rally a new party alive with the crusading spirit. Had the party been successful in 1856, however, the Civil War would doubtless have begun then, and Fremont by temperament and experience was ill-fitted to grapple with such a problem. The inspiration of the campaign which he led carried the Republican party up to the momentous success of 1860. When the clouds broke, Lincoln providentially was at the head of the state, endowed beyond all other men of his time with the peculiar genius required to cope with the storm. The national convention at Chicago, 16-18 May 1860, nominated Abraham Lincoln, of Illinois, for President, and Hannibal Hamlin,

of Maine, for Vice-President. In the election which followed Lincoln and Hamlin received 180 electoral votes; all others received 123 electoral votes. In April immediately following Lincoln's inauguration Fort Sumter was fired upon and the Civil War began. The war occupied the four years of Lincoln's administration. The Republican party was not only charged with the heavy work of administration, but it was responsible for the preservation of the government. When it entered upon the war, the government was without military preparation. Congress and the President were compelled to build navies, raise armies, to provide money and to fight the battles of the republic. They were hampered by secession sympathizers in the South, and "copperheads" in the North, although the masses of the Democratic party and many of its leaders were thoroughly loyal. Lincoln called into his Cabinet Democrats like Stanton, Blair and Welles, and gave high military command to loyal officers with Democratic affiliations. Logan, McClelland, McClellan and Butler were cases in point. Had it not been for this broad and statesmanlike attitude of Lincoln, who always acted on the theory that he was President of all the people, it may be doubted whether the Union would have been preserved. In the midst of the war, on 1 Jan. 1863, the proclamation of Emancipation went into effect. An election for President was held in November 1864. The Democratic party nominated Gen. George B. McClellan of New Jersey, for President, and George H. Pendleton, of Ohio, for Vice-President. The principal plank of its platform was a blunt declaration that the war was a failure. The Republicans at Baltimore, 7 June 1864, renominated Lincoln for President, with Andrew Johnson, of Tennessee, for Vice-President. During the early days of the campaign, while military success seemed to be still far away, Lincoln, believing that he was likely to be defeated at the polls, began preparations for a Democratic successor, pledging himself to do everything in his power in the few months remaining to him to carry through the war and save the Union. His fears were not justified by the results. Lincoln received the electoral vote of every State not in the rebellion except Kentucky, Delaware and New Jersey—212 electoral votes; McClellan received 21.

The assassination of Lincoln, 14 April 1865, was a calamity not only to the country but also to the Republican party, upon which was pressing at the moment the problem of reconstruction growing out of the Civil War. Lincoln had the qualities needed at that time—firmness, moderation and political sagacity. Andrew Johnson, who succeeded to the Presidency, was ill-fitted either by temperament or by training to deal with the delicate questions which then arose. He was hot-headed, uninformed and unstable. He was soon at odds with the leaders of his party in Congress, and by his obstinacy drove them to extremes which might have been avoided had the executive been guided by a broader intelligence. All the measures of reconstruction were forced through in spite of the President's opposition. The difference became so marked

that in February 1868 articles of impeachment were brought against the President by the House of Representatives. In the impeachment proceedings in the Senate the President was not convicted. The vote was: Guilty, 35; not guilty, 19—one less than the two-thirds majority required by the Constitution for conviction.

Ulysses S. Grant, of Illinois, the victorious commander of the Union armies, was the unanimous choice of the Republican National Convention, which met at Chicago 20-21 May 1868. Schuyler Colfax, of Indiana, was the candidate for Vice-President. In the election which followed Grant and Colfax received 214 electoral votes. Seymour and Blair, the Democratic candidates, received 80. Throughout Grant's first administration, both Senate and House were strongly Republican. The 15th Amendment to the Constitution, having been recommended by Congress and adopted by the States, was proclaimed on 30 March 1870. To Grant fell the task of bringing the Southern States into adjustment with the reconstructed Union. The problems of his first administration were largely those which grew out of this new relationship. The former slaves in Southern States exercised for the first time their newly-acquired privileges of voting. The State governments of negroes and "carpet-baggers" which were set up became a scandal. The outrages committed by Southern Democrats upon all Republicans of whatever color aroused the resentment of the North, and kept the South in a condition of disorder which necessitated constant Federal interference.

The situation in the South, coupled with differences between the administration and certain Republican leaders, conspicuous among whom were Charles Sumner, Carl Schurz and Horace Greeley, caused a defection in the Republican ranks. The discontented Republicans met at Cincinnati in May 1872, and nominated Horace Greeley, of New York, for President, and B. Gratz Brown, of Missouri, for Vice-President. The platform declared that sectional issues should be buried, that civil service reforms should be inaugurated and that specie payments should be immediately resumed. The Democratic convention at Baltimore, in July, accepted the Liberal Republican candidates and platform. The regular Republican convention at Philadelphia, 5-6 June, renominated Grant for President by acclamation, and put Henry Wilson, of Massachusetts, on the ticket with him. Grant and Wilson received 286 electoral votes out of 366. The first two years of Grant's second administration witnessed a strong reaction against the Republican party. There was a financial panic in 1872 and 1873, and the scandals of the whisky ring in the Treasury Department, and of the post tradership in the War Department, involving men close to the administration, created a strong feeling of dissatisfaction throughout the country, which resulted in a political overturn in 1874. In the 44th Congress for the first time since 1860 the House of Representatives contained a Democratic majority.

Notwithstanding these adverse influences, Grant's administration in constructive achieve-

ment has hardly been equaled by any other. He established our monetary system on a sound basis through his veto of the Inflation Bill in 1874 and through the enactment, in January 1875, of a law providing for the resumption payments by the redemption of greenbacks in coin. With the co-operation of Hamilton Fish, the Secretary of State, he carried through a strong, far-seeing foreign policy. There has never been a period in American history when an American citizen could count more surely on world-wide respect. He secured satisfaction from Spain for the seizure of the *Virginius* and the execution at Santiago, Cuba, of American citizens among her passengers. Through the Treaty of Washington and the creation of the Geneva Tribunal to pass on the *Alabama* claims, he was first in history to establish arbitration in the settlement of international disputes. By the appointment of a Civil Service Commission he was the first President to give official recognition to Civil Service reform—to the principle of fitness in official appointments rather than selection for partisan political activity. He urged the upbuilding of an American merchant marine through ocean mail subsidies. He enforced the laws, maintained economy in government expenditures, lowered taxes and reduced the national debt.

By the time the Presidential election of 1876 arrived the Republican party had regained some of the ground it had lost. Rutherford B. Hayes, of Ohio, was nominated for President in the convention at Cincinnati, 14-16 June 1876. William A. Wheeler, of New York, was nominated for Vice-President. The Democratic candidates, nominated at Saint Louis, were Samuel J. Tilden, of New York, and Thomas A. Hendricks, of Indiana. The Democrats went into the campaign with a cry of "Turn the rascals out." In the election which followed Tilden and Hendricks received a majority of the popular vote. There was a dispute in regard to the electoral votes of South Carolina, Florida, Louisiana and Oregon. The disputed votes were finally referred to an electoral commission, composed of five senators, five representatives and five justices of the Supreme Court. After a long hearing, during which the country was in great excitement, the commission held that it had no authority to go behind the returns, upon which the choice of electors had been certified. With this decision all the contested votes were awarded to Hayes and Wheeler, and they were declared elected, receiving 185 electoral votes. Tilden and Hendricks received 184 votes. The administration of President Hayes is notable for two reasons. He withdrew Federal troops from the South, thus leaving the negro voters at the mercy of the white population. The Southern States, which under reconstruction had been Republican up to 1876, now passed under Democratic control, and have remained Democratic with only occasional exceptions, ever since. Under the administration of John Sherman, as Secretary of the Treasury, specie payments, assured by legislation urged and made law by Grant, were resumed, and the finances of the government were fixed firmly on a substantial foundation. President Hayes had to deal with a Democratic House of Representatives throughout his term.

In the election of 1880, James A. Garfield, of

Ohio, and Chester A. Arthur, of New York, nominated at Chicago, 2-8 June, were chosen President and Vice-President, respectively, receiving 214 votes against 155 electoral votes cast for Hancock and English, their Democratic opponents. They also received a plurality of the popular vote. For the first time since 1874 the Republicans controlled the House of Representatives. The Senate was evenly divided. President Garfield was shot on 2 July 1881, and died on 19 September, leaving the administration in the hands of President Arthur. During Arthur's administration the Civil Service Commission was created and effective steps were taken to divorce the great body of subordinate offices in the civil service from the changes incident to party politics. Under the administration of William E. Chandler, as Secretary of the Navy, the building of the new navy was begun. A treaty was negotiated with the government of Nicaragua, looking to the construction of an inter-oceanic canal. This treaty had not been ratified by the Senate when the administration came to an end, and President Cleveland promptly withdrew it upon entering the White House. The administrations of Garfield and Arthur were marked by factional differences in the Republican party. The elections for Congress in 1882 resulted adversely, and in the 48th Congress there was a Democratic majority of 73. Grover Cleveland was elected governor of New York by a majority of nearly 200,000 over Secretary Folger, who had been nominated for governor through administration influence. In the election of 1884, Blaine and Logan, the Republican candidates for President and Vice-President—nominated at Chicago, 3-6 June—were defeated by Cleveland and Hendricks, the Democratic candidates, receiving 182 electoral votes as compared with 219 for their opponents. The campaign was fought almost solely on the personality of Mr. Blaine, and had never been exceeded in bitterness. The result was determined by a plurality of 1,149 in a total vote of 1,200,000 in the State of New York. The Democrats controlled the House throughout the Cleveland administration, but the Republicans had a majority in the Senate, a combination which prevented affirmative legislation of any consequence. President Cleveland brought the tariff question sharply to the front in his message of 1887, and the agitation which grew out of that message resulted in a campaign fought on the tariff issue in 1888. The Republicans in that year, in a convention at Chicago, 19-25 June, nominated Benjamin Harrison, of Indiana, for President, and Levi P. Morton, of New York, for Vice-President. The Democrats renominated President Cleveland, and placed Allen G. Thurman, of Ohio, second on the ticket. Harrison and Morton received 233 electoral votes; Cleveland and Thurman received 168. Both Senate and House were strongly Republican. The administration of President Harrison was signalized by the enactment of important legislation and by a strong foreign policy. Thomas B. Reed was speaker of the House of Representatives in the 51st Congress, with a narrow Republican majority. The Democratic minority essayed at the beginning of the Congress to prevent all Republican legislation by appealing to the technicalities of antiquated rules. Speaker Reed,

in the face of vehement opposition, secured the adoption of new rules, under which it became possible for the majority to do business. The Reed rules, although angrily assailed by the Democratic minority, were adopted by the Democratic party when it next came into control of the House, and they prevailed for nearly 20 years. Having obtained the power to legislate, the Republican party in the House proceeded to enact a tariff bill in obedience to the command of the electorate. The McKinley Act was signed 1 Oct. 1890. A law was passed, known as the Sherman Anti-Trust Law, providing penalties for creating combinations in restraint of interstate trade. The House of Representatives passed a bill looking to the more efficient control of Federal elections. This measure aroused great Democratic opposition. It failed to pass the Senate. During Harrison's administration a revolution in Hawaii resulted in the deposition of Liliuokalani, the native queen. A republic was set up, and a commission was sent to Washington seeking annexation to the United States. President Harrison made a treaty of annexation, which the Senate failed to ratify in the few weeks remaining of the administration. The treaty was withdrawn by President Cleveland and the queen was restored to the throne, but Hawaii was finally annexed shortly after the return of the Republican party to power in 1897.

The Congressional elections of 1890 were fought on the issue created by the McKinley bill. In the 52d Congress the House contained 235 Democrats and only 88 Republicans. The election of 1892 resulted in turning all branches of the government over to the Democratic party. Cleveland and Stevenson were elected President and Vice-President, receiving 277 electoral votes; Harrison and Reid, nominated at Minneapolis, 7-10 June 1892, received 145 votes. Both House and Senate were strongly Democratic in the 53d Congress. The administration had come in on a platform which denounced protection as a fraud and declared it to be a fundamental principle of the Democratic party that the Federal government has no constitutional power to impose and collect tariff duties except for the purposes of revenue only. The election of a Democratic President on this platform created distrust in business circles and caused a paralysis of industry which resulted in a financial panic, hitherto unequaled during the spring of 1893. President Cleveland, believing that the financial depression was due to the operation of the Sherman Act, which provided for the purchase of silver bullion called a special session of Congress to repeal that act. The Republicans in the House and Senate combined with a small number of Democrats to carry out the President's recommendation and finally after weeks of heated discussion the law was repealed, but the financial situation was not relieved. The money stringency continued with the dread of tariff legislation hanging over the country. A tariff bill was enacted after months of debate which did not go to the lengths recommended by the President, and which he accordingly denounced as an act of perfidy and dishonor, although he refrained from vetoing it. The fight over the repeal of the Sherman Act and over the Wilson Gorman Tariff Act disrupted the Democratic party and at the Congressional elections held

1894 the Republican party came into control of both branches of Congress.

In 1896 the Republicans at Saint Louis, 16-18 June, nominated William McKinley for President and Garret A. Hobart, of New Jersey, for Vice-President, on a platform declaring for a protective tariff and for the maintenance of the gold standard. The Democratic convention at Chicago was carried away by the cry of free silver coinage at the ratio of 16 to 1. William J. Bryan, of Nebraska, and Arthur Sewall, of Maine, were nominated for President and Vice-President, respectively. The campaign was fought chiefly on the financial planks of the two platforms. McKinley and Hobart were elected by a decisive majority, both in the electoral college and of the popular vote. They received 271 electoral votes. Bryan and Sewall received 176 votes. Both Senate and House were strongly Republican in the 55th Congress. Thomas B. Reed was speaker of the House and Nelson Dingley, of Maine, was chairman of the Committee on Ways and Means. A special session of Congress was called to carry into effect the pledges of the party with regard to the tariff. The Dingley Tariff Act became law 24 July 1897. It marked the beginning of a period of prosperity unequalled in the previous history of the United States.

The disturbed conditions in Cuba growing out of the uprising against Spanish misgovernment were rapidly reaching a point where intervention by the United States would have become inevitable, when the destruction of the battleship *Maine* by a mine in Havana Harbor, on 15 Feb. 1898, roused the resentment of the people and precipitated the war with Spain. The war began on 21 April 1898. The American forces gained two great victories by sea, one in Manila Bay, on 1 May, the other off Santiago Harbor on 3 July 1898. After a brief and effective campaign by land, Spain sued for peace. The treaty of peace was signed at Paris on 10 Dec. 1898. It provided for the acquisition by the United States of the island of Porto Rico in the West Indies and of the Philippine Archipelago and the island of Guam in the Pacific. It placed the island of Cuba temporarily under the guardianship of the United States. The McKinley administration undertook the government of the newly-acquired territory with all the serious problems involved. It quickly set up a stable American government in Porto Rico. It established order in Cuba under a military administration, prepared the people of the island for self-government and on 20 May 1901 withdrew the American military forces, permitting the Cuban people to set up an independent republic of their own. In the Philippines, after four years of armed opposition by guerrilla tribes in Luzon, a civil government was finally established and the people of the island were given a degree of civil freedom such as they had not known in 400 years. Early in the McKinley administration resolutions were enacted providing for the voluntary annexation of Hawaii on terms similar to those contemplated by President Harrison in the treaty of annexation which President Cleveland withdrew. President McKinley was renominated at Philadelphia on 19-21 June 1900. Theodore Roosevelt was nominated by acclamation for Vice-President.

William J. Bryan was again nominated for President at Kansas City on 4 July with Adlai E. Stevenson, of Illinois, for Vice-President. The Democrats reaffirmed the platform of 1896 with its declaration of free silver, but they declared the paramount issue to be the question of imperialism. The Republican candidates received 292 votes in the electoral college; the Democratic candidates 155 votes. The Republicans retained control of both Senate and House. On 6 Sept. 1901 President McKinley was shot at Buffalo by the anarchist Czolgosz. On 14 September he died. Vice-President Roosevelt succeeded to the Presidency. He pledged himself to carry out the McKinley policies under which the country had experienced unparalleled prosperity and he retained all members of President McKinley's Cabinet. Among the cabinet members thus retained in office was Elihu Root. As Secretary of War, Mr. Root effected a complete reorganization of the army on lines which made it capable of quick and effective expansion in time of need. He established the General Staff Corps. John Hay, as Secretary of State, enhanced the prestige of the United States throughout the world by his masterful handling of our foreign relations, securing the recognition of the "Open Door" in China and commanding respect for American diplomacy among the European powers.

The Panama Canal (q.v.), begun under Roosevelt and completed under the succeeding Republican administration, is one of the greatest engineering feats of all time and will have a lasting influence upon the development of the United States, bringing constantly into closer commercial and political relations the people of the Atlantic and Pacific coasts and simplifying the problems of national defense. It would have been indefinitely delayed had it not been for Roosevelt's firmness and prompt decision in dealing with the neighboring South and Central American states. The early years of his incumbency were marked by the settlement of the great anthracite coal strike, which threatened a coal famine in the winter of 1902. He brought the contending operators and operatives together and named a non-partisan commission composed of men representing labor, capital and the public, which named terms of agreement.

The Republican National Convention held at Chicago in June 1904 unanimously nominated Roosevelt as his own successor and named Charles W. Fairbanks, of Indiana, as the candidate for Vice-President. The Democrats at Saint Louis nominated for President Alton B. Parker, of New York, and for Vice-President Henry G. Davis, of West Virginia. Roosevelt and Fairbanks were elected, receiving a total of 336 electoral votes out of 476. In his second administration Roosevelt entered on a crusade against what he regarded as a dangerous tendency to concentrate power in the hands of capitalists controlling agencies of transportation, manufacture and commerce. He secured the enactment by Congress of legislation enlarging the functions of the Interstate Commerce Commission and investing the Commission with authority to fix railroad rates and abolish discriminating practices. The Department of Justice with his approval brought suit under the Sherman Law against large indus-

trial organizations as combinations in restraint of trade.

In the spring of 1904 war broke out between Russia and Japan. After the battle of the Sea of Japan, 27 and 28 May 1904, in which the Russian fleet was almost annihilated, President Roosevelt (9 June) urged on the Russian and Japanese governments the desirability of putting an end to the war and proffered his good offices toward bringing about peace. Both governments acceded and appointed plenipotentiaries to discuss terms. Portsmouth, N. H., was selected as the place of meeting. A deadlock arising between the plenipotentiaries, the President again appealed to the high contracting parties and finally succeeded in bringing about an agreement. A treaty was signed at Portsmouth, 5 September. For his services in bringing about peace President Roosevelt was later awarded the Nobel Prize.

In November 1906 President Roosevelt made a visit to the Isthmus of Panama. This was the first time a President of the United States had gone outside the territorial limits of the Union, even technically. It was at a time when Congress was not in session and there were no great and immediately pressing questions which might call for official action by the President.

The first session of the 60th Congress passed an act to regulate the employment of child labor in the District of Columbia, intended to be a model law on the subject. It was the forerunner of more comprehensive legislation which was declared unconstitutional by the Supreme Court in 1918. On 30 May 1908 was passed an act to amend the national banking laws of the United States and creating a National Monetary Commission, which was authorized to investigate and ascertain what changes may be necessary in the banking and currency laws. This commission made an exhaustive and scientific study of our entire financial policy, which it had long been plain was faulty. Our banking system, based on legislation adopted early in the Civil War and applicable primarily to the Civil War emergency, was quite unequal to the demands of our expanding commerce. Our currency was inelastic. In times of monetary stringency the resources of the treasury were repeatedly called upon to meet a desperate emergency and even this reservoir of credit occasionally proved inadequate, as was evidenced in the panics of 1873, 1893, 1901 and 1907. The Monetary Commission composed of senators and representatives was fortunate in the high character of its personnel. At the head was Nelson W. Aldrich of Rhode Island, chairman of the Finance Committee of the Senate; while among the representatives on the commission were Edward B. Vreeland of New York, chairman of the House Committee on Banking and Currency, and John W. Weeks of Massachusetts, later a United States senator, a man of constructive ability and financial knowledge. Owing to limitation of time it was impossible to secure the enactment of a comprehensive measure such as Senator Aldrich and his associates had in mind, but a measure calculated to meet immediately urgent necessities and called the "Aldrich-Vreeland" Emergency Act was enacted. This act was first called into operation in 1914, after the outbreak of the European War, and by resorting to

the methods of relief which it provided the danger of panic was averted. A striking feature of Roosevelt's administration was his dramatic action in sending around the world a great American fleet consisting of 16 battleships which stopped at many ports, impressing European and Asiatic powers with the potential naval strength of the United States. The fleet left Hampton Roads, Va., 16 Dec. 1907 and arrived at Hampton Roads, on its return, 22 Feb. 1909. The principal places visited were Trinidad, Rio de Janeiro, Valparaiso, Callao, San Diego, San Francisco, Honolulu, New Zealand, New South Wales, Australia, Manila, Japan, Ceylon, Suez, Naples, Villefranche, Athens, Algiers, Gibraltar and Portugal and everywhere the fleet was received with great demonstrations of goodwill toward the United States. While Roosevelt was President, the United States remained at peace. No foreign nation had the hardihood to trespass on the rights of American citizens on land or sea.

The Republican National Convention at Chicago in June 1908 named William H. Taft, of Ohio, for President and James S. Sherman, of New York, for Vice-President. The Democratic Convention at Denver, Colo., named William J. Bryan for President and John W. Kern, of Indiana, for Vice-President. Taft and Sherman were elected, receiving 321 electoral votes out of a total of 483.

President Taft, who had been a Federal judge, governor-general of the Philippines and later Secretary of War, was the personal choice of President Roosevelt for the succession, but he had hardly taken his seat before differences arose between the two. President Taft was lacking in political prescience. He showed a leaning toward the more conservative element of the party, called into his Cabinet men who were not in sympathy with the policies of his predecessor and asked for the resignation of men in high positions, in whom his predecessor had shown especial interest. A bitter contest grew out of the attitude of the Secretary of the Interior toward the program of the Roosevelt administration, which looked to the conservation of mineral and agricultural resources, especially in the West. This resulted in the displacement of Gifford Pinchot, the head of the Forestry Division, one of Colonel Roosevelt's closest friends. The Republican party in its platform in 1908 had declared for revision of the tariff and President Taft, on his own initiative during the campaign, had interpreted this to mean a "revision downward"—a declaration which was made much of later. Sereno E. Payne of New York, as chairman of the House Committee on Ways and Means, brought in a bill which was not regarded favorably by many members of the party, especially those from Western and Middle Western States, and when the Finance Committee of the Senate, under the leadership of Senator Aldrich of Rhode Island, undertook its amendment, reporting a bill to the Senate which Western senators thought drawn too closely in accordance with the necessities of textile manufacturers of the Northeast, it aroused bitter opposition and gave rise to one of the most acrimonious political debates which had taken place in the Senate in many years. The bitterness aroused by the contest had an influence on the future of the

United States which it would be hard to overestimate. It had much to do with the election of a Democratic House in 1910, with the election of a Democratic President in 1912 and with the Republican reverses which resulted in Democratic ascendancy during the years immediately preceding the war with Germany and the reshaping of the map of the world. The Payne-Aldrich Tariff Act was approved by President Taft 5 Aug. 1909, although he had severely criticized its provisions. Rates of duty were increased where found necessary or desirable, but were reduced in many instances. All prior commercial and reciprocity treaties were terminated, except the treaty with Cuba, and authority was given the President to create a board of experts to collect information upon cost of production of commodities at home and abroad. In opposition to public sentiment and against the judgment of Republican leaders, President Taft persisted in negotiating a reciprocity treaty with Canada. The agreement which contained provisions seriously affecting the agricultural and industrial welfare of the northern tier of Republican States was signed on 26 Jan. 1911. It passed the House on 14 Feb. 1911 under strong administration pressure but was not brought to a vote in the Senate before the expiration of the 61st Congress on 3 March 1911. A new bill was introduced at the special session of the new Congress which was called to meet on 4 April. Both House and Senate acted favorably on the bill, but Canada had seen new light in the meantime and failed to act. Thus reciprocity was defeated by the indifference of Canada after the administration had exhausted its influence in forcing it through a reluctant Congress. The proceeding accentuated the administration's unpopularity and helped to precipitate the split in the party.

The struggle in the House of Representatives between Speaker Cannon and the recognized organization on one side and a combination of Democrats and Republican insurgents on the other also contributed to the party's demoralization. Under the Reed rules the speaker appointed all committees and was himself chairman of the Committee on Rules which fixed the order of precedence for legislation, by the introduction of special rules, limiting debate and fixing the time for a vote, thus concentrating power in the hands of a small group of leaders. The insurgent Republicans with the aid of the Democrats, after a tumultuous time in the 61st Congress, adopted by a vote of 191 to 156 a resolution taking out of the speaker's hands the appointment of the Committee on Rules and making the committee elective. The 62d Congress made all committees elective and reduced the influence of the speakership below the point where Speaker Reed had found it. As the end of the administration approached it became clear that President Taft could not be re-elected. He had not only alienated the Progressives in the party who regarded Colonel Roosevelt as their leader, but he had also alienated the substantial business element in the North and East by prosecution of suits under the Sherman Anti-Trust Law. Colonel Roosevelt had spent much time abroad during the early part of the administration, hunting big game in Africa, exploring in Brazil and visiting European and South American capitals. On his re-

turn the demand became vociferous in many quarters that he be a candidate against Taft for the nomination. Through delay in an announcement of his candidacy, however, many party leaders who might otherwise have favored it committed themselves to the renomination of Taft and when the announcement finally came it was accompanied by radical declarations for the recall of judges and judicial decisions and by other advanced ideas, antagonistic to the political convictions of many who had previously been among Colonel Roosevelt's most cordial supporters. The campaign for nomination was vituperative. The contending factions were not sparing in attacks upon each other's motives. The National Convention assembled at Chicago in June 1912 in the heat of passion, with many contested seats. After much wrangling the majority of these contests were determined in favor of delegates pledged to Taft in accordance with recognized rules and precedents which had governed previous conventions. Taft and Sherman were renominated. The followers of Roosevelt, denouncing the action of the convention as illegal and declaring that the nomination had been stolen, withdrew before the ballot was taken, organized a new party and called a convention of their own. This convention of Progressive Republicans met at Chicago in July, nominated Roosevelt for President by acclamation and named Hiram W. Johnson, governor of California, as his running mate. The Democratic Convention at Baltimore in June nominated for President Woodrow Wilson, of New Jersey, and for Vice-President, Thomas R. Marshall, of Indiana. In the election Taft carried only two States, Vermont and Utah, with eight electoral votes. Roosevelt received 88 electoral votes and Wilson received 435 electoral votes. The Congress chosen was Democratic in both branches. Vice-President Sherman died before the meeting of the electoral college and the votes of Vermont and Utah were thrown for Nicholas Murray Butler of New York. With the inauguration of Wilson and Marshall on 4 March 1913 the Republican party went out of power in all departments of the government and remained in a minority in all departments until 4 March 1919 when they regained control of the Senate and the House of Representatives — the Senate by a majority of two, the House by a majority of 45.

Although in a minority and excluded from participation in administration councils, the Republican leaders in Congress and out were able to modify to some extent radical and dangerous tendencies in legislation, to neutralize the errors of the majority and to perfect measures which had possibilities of merit. The Federal Reserve Act of 23 Dec. 1913 as enacted carried into effect many of the changes in our banking system recommended by the Monetary Commission, and in its final form it had the benefit of the knowledge and experience of Senator Weeks, who at that time was the recognized Republican authority in the Senate on financial questions. The amendments which he induced the Senate to incorporate in the original bill framed by the administration and forced through the House, were of incalculable value in eliminating provisions which contained the germs of currency inflation and future panics.

The Underwood Tariff Act was an expression of classic Democratic theories — a tariff for

revenue, not protection. It brought on industrial doubt and depression, arrested manufacturing production and led to unemployment and distress all through the industrial North. The outbreak of war in Europe nullified the evils of the act, since the peaceful and exporting industrial energies of Europe were transferred to the industries of war and destruction and gave to neutral America an artificial but highly profitable market for all her products and stopped the western flow of competitive products.

The plainly-announced purposes of the Wilson administration and its intolerance of advice and criticism had one wholesome political effect—it made a solid and united party of all Republican factions. The National Convention of June 1916, at Chicago, nominated for President former Gov. Charles E. Hughes, then on the Supreme Court bench, and for Vice-President, Charles W. Fairbanks. The Democratic National Convention at Saint Louis, a week later, renominated Wilson and Marshall. For over three years the American people had been fed on the strange doctrines of pacifism, internationalism and socialism. While Europe was at war, we were at peace, and through the very fact of war abroad were rich and prosperous at home. At the same time we were earning the contempt and ill-will of all the warring nations. American citizens had suffered much in Mexico, while the government pursued its policy of "watchful waiting," and now were slaughtered on the high seas without any vigorous or effective steps being taken to protect American interests. Republican leaders, like Roosevelt, Lodge and Weeks, and military leaders like Gen. Leonard Wood, saw that we might at any time be dragged into war in order to maintain our national self-respect, and urged insistently that we put ourselves in readiness, but the administration, preaching neutrality and neglecting even ordinary preparations, went to the country with the boast that Wilson had "kept us out of war" and carried the election by a narrow margin of the popular vote in States which were affected by this cry. The Wilson administration had undivided responsibility and unlimited power from the time war was declared—modified only by constructive criticism by the Senate of inefficient and extravagant control of war activities, and when the Congressional elections of 1918 were at hand, the President issued an appeal to the electorate to return a Democratic Senate and House because "the leaders of the minority in the present Congress have unquestionably been pro-war but they have been anti-administration"; because "unity of government is as necessary now in civil actions as it is upon the field of battle," and because "the return of a Republican majority to either House of the Congress would moreover be interpretative on the other side of the water as a repudiation of my leadership." The response of the country was emphatic and unmistakable. The Congress elected was Republican in both branches, and the President within a month after the election set sail for Europe to appear there in the Peace Conference as the spokesman of American opinion and purpose.

The Republican party from its beginning has been distinctly an American party, a party

of constructive ability and of moral purpose. In power it has been rich in achievement and in a minority it has been unselfishly loyal to the best interests of the United States. The war with Germany is the first war since the United States became a nation in which the party out of power has stood unswervingly for the successful prosecution of the war and by its attitude has forced the party in control to greater efforts than those in power would have preferred. The most compact and forceful summary of its principles to-day was set forth in the Middlesex Resolutions accepted by the Republicans of Massachusetts just before the signing of the armistice which marked the end of the great European War. This is the creed:

To carry on the war unflinchingly to unconditional surrender.

Germany to make full reparation for her crime against the world.

A lasting peace which leaves America the master of her destiny—a nation unbeguiled by international or socialistic dreams.

Revitalize the Hague tribunal. Create machinery to insure observance of its awards.

Political and economical independence for the United States.

—The Monroe doctrine to be respected and enforced.

No foreign power to have the right to meddle in American affairs.

No European interference in Cuba, Mexico, the Caribbean or the Philippines.

The Panama canal to be owned, controlled and fortified by the United States.

A navy strong enough to guard our commerce and our coast.

A strong army to repel invasion and resist aggression.

Universal military training that we may always be prepared for national defense.

Protection of American industry. No agreements with any other nations preventing the enactment of such tariff laws as we see fit.

Internal taxes an incident to revenue and not its chief reliance. No excessive and unequal burdens of taxation upon any section, industry or class.

A great merchant marine.

Congress to begin at once to solve tremendous problems soon to be upon us. We who were criminally unprepared for war must not be unprepared for peace.

When war is done, to lose no time in bringing home the men who have been fighting overseas.

To stop the insidious growth of bureaucratic government and put an end to the petty tyranny of manifold commissions.

No government ownership except of undisputed government activities.

To restore freedom of speech and of the press.

To reassert the constitutional prerogative of Congress that this may once more be a government of laws and not of men. Having fought to rid the world of Prussianism, let us not Prussianize ourselves.

This platform, promulgated before the armistice with Germany became effective on 11 Nov. 1918 not only anticipated the termination of diplomatic negotiations in the settlement of terms of peace but also defined the party's attitude on foreign and domestic problems which speedily pressed for solution. After the conclusion of the armistice with Germany, President Wilson hastened to Europe to conduct in person the negotiations for peace on behalf of the United States. He remained abroad until the end of February 1919 returning for a few days in order to sign the bills passed by Congress in the closing days of its session; he then returned to France and remained abroad until July, when he brought back with him the treaty with Germany, which he and the representatives of other powers had signed, including the covenant of a League of Nations, the ostensible object of which was to create an organization through which the permanent peace of the world might be secured. The Senate, deprived of the usual sources of

information with regard to the details of the treaty of peace, undertook to consider that great question with the aid of such inquiries as it could institute on its own initiative. The majority of the Republicans in the Senate believed that the treaty as signed, including the covenant of the League of Nations, failed to protect American interests and imperilled recognized American doctrines. The division in the Senate and in the country was not strictly on party lines. Some Democratic leaders were equally insistent with the majority of Republicans in their determination to Americanize the treaty and so amend the covenant of the League of Nations that it should not endanger national interests. As the inquiry in the Senate proceeded, the debate became nation-wide and the feeling throughout the country strengthened that in the parleys at Paris, American delegates had entered into engagements to which the Senate could not assent without betraying the United States. There was an insistent demand that the treaty be rejected altogether and that the Congress by resolution declare a state of peace. So strong did this feeling grow that on 4 September the President began a tour of the country in order to save his work at Paris from defeat.

LOUIS A. COOLIDGE,
*Formerly Assistant Secretary of the Treasury,
Washington, D. C.*

REPUBLICAN PARTY, Jeffersonian, the name of the party of which Thomas Jefferson was leader. During Washington's first administration the Federalist party showed a tendency to centralize the government and to destroy little by little the rights of the States. The Federalist leader at that time was Alexander Hamilton, and Thomas Jefferson was the ablest among the opponents of the Federalists. The differences between the two led to the resignation of Jefferson from Washington's cabinet on 31 Dec. In the election of 1796 Jefferson was the candidate of the Republicans, but was defeated by John Adams, the Federalist candidate. Under the law as it then existed Jefferson became vice-president. He watched carefully the march of events and when the Federalists, who were almost monarchists at heart, passed the hateful Alien and Sedition Laws, Jefferson and Madison prepared and secured the passage of the Kentucky and Virginia resolutions. The reaction against the Federalists set in at once. Jefferson was the candidate of the Republicans in 1800 and received an equal number of votes with Aaron Burr and it devolved upon the House of Representatives to make one of the two president. The Federalists thought to prevent an election, but calmer counsels prevailed and, Hamilton throwing his weight to Jefferson, the latter became President. His first administration was marked by great simplicity and by a great reduction in expenditure. See **JEFFERSON, THOMAS.**

REPUBLICS, Duration of. It is not easy to set down in each case precisely the length of years that the various republics have existed. Among historians there are differences, in most instances, as to the dates of beginning and ending. Some authorities date from the physical overthrow of a monarchy or other form of government preceding; others from the beginning of the struggle for popular rights; others from the adoption of a constitution, and so on. Some accept as the end the accession of king or emperor, or the actual establishment of a new form of authority, while others hold that the republic really became non-existent before those events occurred to finally and formally mark its disappearance. Frequently the birth or the death of a republic has been a gradual development extending over many years, so that it is almost impossible to fix the exact time when it was fully fledged,

or, on the other hand, had passed away completely. Some republics, noticeably those of South America and Central America, have had interrupted careers, republican rule in them being frequently suspended for a few months or even years, while dictators have held power, although in form, at least, it has been practically continuous. Others have begun as members of a republican federation and later have been established entirely independent. Venezuela, Colombia and Ecuador were originally united in the one republic of Colombia; Guatemala, Honduras, Nicaragua and San Salvador were first members of a federal union. It is a disputed question whether such republics should be considered as dating from the beginning of the federation or from the beginning of their individual independence. In the appended table the former view is generally taken; approximately, then, the duration of life of the world's republics is as follows:

Israelitish Commonwealth...	1491-1095 B.C.	396 years.
Grecian republic	700-146 B.C.	554 years.
Carthage	850-146 B.C.	704 years.
Rome	535-29 B.C.	506 years.
Lombard Communes	1183-1530	347 years.
Genoa	1000-1802	802 years.
Venice	600-1796	1196 years.
Amalfi	900-1135	235 years.
Free Cities of Germany	1241-1630	389 years.
Hamburg	1630-1919	289 years.
Lubeck	1630-1919	289 years.
Bremen	1630-1919	289 years.
Frankfort	1630-1810	180 years.
Iceland	928-1261	333 years.
The Netherlands	1609-1805	196 years.
French Republic I	1792-1804	12 years.
French Republic II	1848-1852	4 years.
French Republic III	1871-1919	48 years.
San Marino	885-1919	1034 years.
Andorra	790-1919	1129 years.
Switzerland	1291-1919	628 years.
Liberia	1820-1919	92 years.
Orange Free State	1854-1919	65 years.
South African Republic	1849-1903	54 years.
United States of America	1776-1919	143 years.
Mexico	1824-1919	88 years.
Venezuela	1819-1919	100 years.
Colombia	1819-1919	100 years.
Ecuador	1819-1919	100 years.
Peru	1821-1919	98 years.
Bolivia	1825-1919	94 years.
Paraguay	1811-1919	108 years.
Argentina	1810-1919	109 years.
Uruguay	1825-1919	94 years.
Chile	1810-1919	109 years.
Guatemala	1823-1919	96 years.
Honduras	1823-1919	96 years.
Nicaragua	1823-1919	96 years.
San Salvador	1823-1919	96 years.
Costa Rica	1821-1919	98 years.
Brazil	1889-1919	30 years.
Haiti	1804-1919	115 years.
San Domingo	1844-1919	75 years.
Cuba	1903-1919	16 years.
Hawaii	1894-1919	25 years.
Panama	1903-1919	16 years.
Portugal	1911-1919	9 years.
China	1911-1919	8 years.
Russia	1917-1919	2 years.

Of these 48 republics 33 were in existence in 1912. Taken altogether history shows that these nations have been as stable, prosperous, influential and powerful under republican forms of government as under monarchical or other form. No dynasties can compare in years of existence with the 12 centuries of Venice, the 11 centuries of Andorra and the 10 centuries of San Marino. Few can show longer life than the republics of Israel, Carthage, Greece, Rome, Genoa, Switzerland and the Hanse cities of Germany. The ancient republics of Greece, Carthage, Rome, Lombardy, Venice and Genoa were the greatest nations of their times. In

art, literature, law, commerce — all that goes to make up the best of modern civilization, they led the world for more than 1,000 years, and left a heritage of good for all mankind coming after them, such as can be credited to no monarchy. The death of those that have gone out of existence was not, as is claimed by some, due to defects peculiar to the republican form of government. It came about naturally from the condition of things in the civilization of the earlier centuries. Men were warlike in those days, unrestrainedly contentious and regardless of the rights of others; public and private affairs were in the hands of the turbulent; class distinctions were sharply defined. Under such conditions all governments were, for the most part, short lived. Monarchies and oligarchies suffered as well as others. One after another they rose and disappeared, and none of them, until comparatively recent centuries, endured as long as the republics that were contemporary with them or that succeeded. The older republics deteriorated in public spirit toward the end; they were torn by internal dissensions; they became the prey of extravagance, dissolution and idle wealth within their borders, while jealous neighbors constantly sought to plunder and destroy or subjugate them. But these were dominant evils of the day in all lands and it stands to the credit of republican institutions that, despite disintegrating forces constantly at work, they existed long and splendidly. In modern times the story has been much the same. Only Great Britain and two or three smaller monarchies can show results comparable with contemporary republics, and in those countries constitutions have given the people almost as much voice in public affairs as in a republic. Even in South America and Central America where government is still more or less chaotic and uncertain, the republics are an improvement upon the despotic rule of Spain which they succeeded. The first French republic was undisguised anarchy; the second was merely in comparison a temporary flurry, but the third suffered in no wise in comparison with the most brilliant decades of the French kingdom or empire. The United States of America, under republican form of government, in all that goes to make up a great nation, has advanced to the forefront of world powers. Brazil has been a well governed in the decade and a half of a republican existence as it was even under the last Dom Pedro, most beneficent and most democratic of monarchs. The lesson to be drawn from the history of these republics is that men are able to govern themselves well. The dangers and evils that may threaten the republic have always been and are now the dangers of the evils inherent to the period, and threatened to any government, republican or otherwise. The elasticity of republicanism, permitting easier adaptation to changing conditions, gives it an advantage over the more rigid monarchy. That the general trend of the 19th century was toward republicanism cannot be questioned. Nearly half the republics that history tells of were started then and all of them are now in existence. At the beginning of the 21st century more than one-half of the territory of the civilized world belonged to republics and fully one-third of the population.

in all the civilized countries lived under republican rule. See REPUBLIC; REPUBLICS, THE HISTORY OF.

REPUBLICS, The History of. The word republic is derived from the Latin *res*, a thing, and *publicus*, belonging to the people. The word is frequently applied to any group of individuals having a common interest in their pursuits, as the republic of letters. Its general usage, however, is as a political designation for a state or country in which the supreme power of government is vested in rulers elected periodically by those of its citizens who have acquired the right to vote. In the narrowest sense a republic is a democracy where political power rests in all the people and is wholly in their unrestricted control. It is the antithesis of a monarchy, where the power rests in one individual or family and is self-perpetuating through dynastic succession. Between these two extremes of monarchic and democratic government are other forms, of oligarchic or aristocratic character, where the right of participation in the direction of public affairs is in the hands of classes or of a restricted portion of the community. Strictly speaking, these are not republics, but in history nearly all authorities agree in so regarding and placing them.

Republics may be divided into two distinct types, the centralized and the non-centralized. A centralized republic is one in which all power is deputed to and is exercised by the general government entirely independent of local authority in any of the subdivisions of the country. France and some of the South American republics are examples of the centralized republic. When the power of the general government is derived, to a greater or less extent, from the local constituent bodies or states which also have independent rights and powers over which the general government has no constitutional control, we have the non-centralized republic. The Greek republics, the free cities of Germany and the United States of America are examples of the non-centralized republic.

The Earliest Republics.—In prehistoric times when men first began to feel the necessity for communal control of their affairs and interrelations, government took somewhat the form that has persisted in modern times in the monarchy. At the beginning this was patriarchal, as history shows us at later date among the Hebrews, the Pelasgians and other early races. The head of the family was recognized as supreme in authority, first over his immediate family and then over its branches. As the associated families grew in number and size and expanded into tribes, the strongest family or group of families asserted its pre-eminence by force or peacefully, by common consent, and

became the ruling power; hence the king and the dynasty. It was a reversion from this condition that led to the earliest republics of which history has anything to tell. Among the Israelites, the patriarchal or family government continued until the time of the Egyptian serfdom. When, under Moses, the people escaped from Egypt and became again free and independent, the Israelitish commonwealth or republic was established; it lasted nearly four centuries, from 1491 B.C. to 1095 B.C. Under Moses and Joshua the government was of the consolidated and centralized type. All the people, young and old, rich and poor, male and female, had a voice in public affairs and the privilege of political preferment. This is the earliest record of choosing rulers by elective franchise. Only the priesthood was a privileged class. Laws were beneficent and wise; a general system of education was established; the military spirit was fostered so that the nation became a strong power. Usury was illegal and interest was regarded with disfavor. An agrarian law assigned to each family a small acreage of land and this was made inalienable; it could not be held under mortgage or sale. Of this early stage of the republic it has been said that "the descendants of Abraham had reached a higher state of virtue and happiness than any other nation of that period." Upon the death of Joshua the seeds of disintegration were sown. The different states seceded, forming independent confederacies, although generally all were united for common defense. Dissensions arose, patriotism weakened, officials became dishonest and finally the people, whose will was still the highest law of the land, demanded of Samuel a king. Saul was anointed king in 1095 B.C. and that was the end of the Israelitish republic.

Greece.—In the Heroic Age, Greece was divided into several states or tribes, each ruled by a chief or king. It was about the time of the first Olympiad—776 B.C.—772 B.C.—that the people began to aspire to political independence, and they gradually deposed the kings, setting up chosen rulers in place thereof. At first the new governments were oligarchal, but in the course of time all of them, except that of Sparta, became democratic. The states were only loosely bound to each other and national unity was altogether lacking. Athens became foremost in the time of Thucydides and exercised a sort of sovereignty over the entire country. But after a while Sparta imposed her oligarchic system upon the other states and then again Thebes had the ascendancy. Greek civilization, Greek laws, Greek art, Greek literature, Greek patriotism, became forces that have never ceased to dominate the world. But the passion for wealth and display, local political strife and particularly jealousy between the different states and cities led to dissension and disunion. Greece came under the influence of the Persian monarchs, then was ruled by the Macedonian kings, Philip and Alexander, and finally, when in 146 B.C. the Roman legions conquered Macedonia, the last Grecian league, the Achæan, and then Athens, were completely vanquished. Successively under the domination of Roman Empire of the East, the Byzantine Empire and Turkey, Greece, finally reunited, became an independent kingdom, under a constitutional monarchy in 1832.

Carthage.—Carthage had its beginning before history had its records. Five centuries before Christ it flourished under rulers who were not hereditary, but who were elected by the people. The commonwealth of Carthage was a centralized republic, unlike that of Greece and similar to that of Rome. In the Great Council of the State and in the Council of the Elders there was something of aristocracy, but on the whole the people were in control. There was a liberal administration in the interest of all citizens alike, courts of justice, banking institutions, public libraries and schools of literature and art. Carthage acquired great wealth and a high degree of civilization. Her territory was wide, extended and rich, and the city, Carthage, capital of the country, was the most superb of that day, being to the republic what Paris is to France. The prosperity of the commonwealth begat its downfall. Political feuds developed and its citizens became divided into factions. Rome, grown in power, saw the opportunity for revenge for earlier defeats and humiliations. Her legions swept over the country. Carthage, the splendid city, was blotted from the face of the earth, never to reappear, and with her went every vestige of the republic of which she was the metropolis.

Rome.—Like Israel and Greece, Rome had its political beginning in peoples who were organized in families, clans and tribes. In the early Roman state a king was the ruler, partly an hereditary chief and partly an elected magistrate. Naturally the kingly office grew in importance and power until, in the time of the Tarquins, it was well-nigh supreme. Still even during this regal period the people retained much power. The inhabitants were divided into two classes, patricians and clients, and the franchise and right of office-holding were possessed only by the former. A similar condition existed under the Etruscan kings, who ruled from the 7th century before Christ. With the deposition of Tarquin, the Proud, at the close of the 6th century before Christ, the Roman republic began and lasted until 27 B.C., nearly five centuries. Of the early years of the republic little is positively known. Romance and tradition make up a large part of the story. In order to curb the growing power of the executive office, administrative authority was vested in two elected consuls, with limited tenure of office; but as had always been, the franchise still remained in the patrician class to the exclusion of the plebeians. No sooner was the republic fully established than a struggle for power began between the two classes and lasted for several centuries. The patricians endeavored to establish an exclusive aristocratic government on the ruins of the monarchy, and the plebeians demanded a large participation in common civic privileges. Slowly but surely the plebeians gained. Gradually the social and political barriers between the classes were broken down and by the 3d century before Christ practically all distinctions in regard to the franchise and office holding had disappeared. In 200 years the Romans emancipated themselves, first from kingly and then from oligarchal domination. During these and the ensuing centuries constitutional changes were frequent, but until toward the end, generally to the enlargement of the powers of the people.

Under this republican government Rome arose to a civic distinction unparalleled at that time. The story of the city and state fills the most brilliant pages of ancient history. Her law is to-day largely the basis of law throughout the civilized world. She made herself mistress of the peninsula of Italy and then conquered the world. Her power became colossal and then her conquests proved her undoing. War made her a military nation and agriculture was neglected. The spoils of victory brought to her enormous wealth and created great fortunes for her soldiers. Inordinate extravagances followed and resultantly the condition of the poorer classes became more and more distressing. Reverence for law disappeared, many attempts were made by the aristocracy to control the power of the masses and the state became an arena on which men were merely contending for power, wealth and influence. The civil war in which Marius and Sulla were the leaders was the final struggle between the aristocratic and democratic elements. Constitutional government had been long forgotten and, in the general distress, all classes of citizens felt that a change of government with a strong man at the head was the only thing that could save the state. So Sulla was proclaimed dictator in 81 B.C. In form the republic endured for 50 years more under the consulships of Pompey, Cæsar, Crassus and Cicero, but it was little more than form. The dictatorship of Cæsar in 48 B.C. was another step toward the end, and Rome was ready for the empire when Octavius Augustus came to the head of the state and was proclaimed emperor in 33 B.C. Republican institutions more and more faded into the background during the life of Augustus and in all but name he was an absolute monarch. When Tiberius succeeded to the throne, Rome was an empire in reality.

Mediæval Republics.—In mediæval times there were the Lombard communes, the independent cities of Italy, the free cities of Germany and Iceland, all of which had republican forms of government. Lombardy, in the north of Italy, was a separate kingdom, part of the Carolingian Empire, or annexed to the German Empire until near the close of the 10th century. Then arose a number of independent duchies, as Mantua, Susa, Piedmont and others and several independent cities that in the 11th century became republics. Among these were Florence, Milan, Padua, Piacenza, Treviso, Modena, Cremona, Vicenza and Bologna. In them municipal organization grew up independent of Church or empire that had heretofore dominated. Consuls were elected by the citizens and arts, crafts and guilds had part in the control of affairs. Between these cities there was no firm federal compact, but in times of danger they formed powerful leagues for mutual defense. Although they grew in wealth, power and influence their governments were never stable. They quarreled with each other and were torn by internal dissensions, constantly shifting between the power of the people and the power of the few. The history of Florence, which remained longest the champion of constitutional liberty, is a story of centuries of contention between the forces of democracy and oligarchy. One by one these cities finally fell before the assaults of foes, were incorpo-

rated into kingdoms, duchies or principalities, becoming, in some instances, possessions of Austria and finally were incorporated into the kingdom of Italy. In the 10th century Genoa established a free constitution. During the next two centuries the republic increased in wealth and power. A world-wide commerce was established and many of the large cities of southern Europe and Asia came under her control, as Marseilles, Nice, Venice and Constantinople. At the outset the constitution of the state leaned toward an aristocracy. A bitter antagonism between conservatism and democracy developed, changes of government became frequent and in 1339 the citizens elected a doge for life. Three centuries later Genoa yielded to Austria and then to France, by the Treaty of Vienna became a tributary city of the Sardinian monarchy and ultimately a part of the Italian kingdom. Venice had an independent government in the middle of the 6th century, her rulers being called military tribunes. From 697 to 755 the elected chief magistrate was the doge, whose authority was well-nigh imperial. Universal suffrage existed, but during the season of the republic's greatest prosperity, wealth and aristocracy for the most part administered public affairs. In time the democracy demanded more rights and privileges and in the 11th and 12th centuries the strife between the aristocracy and the commonalty was determined and bitter. In 1172 the government became essentially a patrician oligarchy with constantly increasing power, and in 1298 popular elections were abolished by the Great Council. Further encroachments upon the civic rights of the people, expensive wars with sister republics and selfish legislation of the oligarchy undermined patriotism, and for four centuries the classes fought with each other. In 1674 the oligarchy yielded to the commonalty and for another century the republic continued in varying fortune until Napoleon, in 1797, placed it under the domination of Austria. Amalfi, on the west coast of southern Italy, was an independent city of 50,000 inhabitants in the 9th century and the capital of a flourishing republic. Toward the close of the 11th century Amalfi was subjugated by the Normans.

Later Struggles.—The larger towns and communities of northwestern Europe gradually freed themselves from the exactions of feudal lords and became independent. From the beginning of the 12th century they established a large commercial intercourse between themselves and with the rest of the world. To protect themselves against marauders and to develop their commercial interests they formed the Hanseatic League in the 13th century. Hamburg, Lubeck, Bremen, Frankfort and Cologne were the principal cities in this league, but city after city joined the union until it embraced 85, and in power matched the strongest governments of Europe. These cities were sovereign states and, while part of the German confederation or empire, they exercised full authority in their local affairs. In the Hanse confederacy they held the Baltic in dominion and controlled the foreign commerce of northern Europe. The league lasted until 1630, although previous to that date it had been shorn of its powers. Most of the cities had been absorbed into the German kingdoms or principalities and at last only Hamburg, Lubeck,

Bremen and Frankfort remained independent. In 1813 these four became free members of the German Confederacy, but in 1866 Frankfort fell to Prussia. Hamburg, Lubeck and Bremen still retain their freedom in local affairs, being governed by chambers of representatives elected by popular vote.

Iceland was settled by exiles from the tyranny of the princes of Norway, Denmark and Scotland, in the 10th century and a republican form of government was established in 928. At the head was placed a supreme magistrate, elected by the people and sharing authority with a general assembly. This form of government lasted for nearly 400 years and Iceland attained to civilization and a measure of prosperity. But internal dissensions sprang up and civil wars devastated the island. In 1621 the National Council, by common consent of the people, invited Haco, king of Norway, to become Iceland's ruler and in 1380, again by common consent and peacefully, the island was transferred to Denmark.

During the 10th, 11th, 12th and 13th centuries Belgium and Bavaria were split up into small dominions. In 1383 the house of Burgundy obtained control of this territory, which afterward became the 17 provinces of the Netherlands. Following the Burgundian rule came the long struggle with Spain, which ended in 1648 with the Peace of Westphalia, by which the independence of the republic of the United Provinces was acknowledged by the great powers of Europe. The provinces had formally united, with William of Orange as stadtholder, in 1580. The republic continued through many vicissitudes for two centuries, the people enjoying political freedom and the nation acquiring a high degree of power and prosperity. European politics could not withhold its hand from the Netherlands, and the Dutch provinces were in constant turmoil within and engaged in war without. In 1747, through all these influences, William IV was made captain and admiral-general of the whole union and stadtholder of the seven provinces; a little later these offices were made hereditary in both male and female lines. At the time of the French Revolution the stadtholder was driven out by the French and the old republican forms of government re-established; but in 1814 the people recalled the Prince of Orange from his exile in England and established the monarchy, under William I, king of the Netherlands.

France.—The first French republic had an inglorious career of 12 years. It began with the overthrow of the monarchy in 1792 and ended with the crowning of Napoleon as emperor of France, in 1804. The 12 years of this republic were 12 years of terror. A state of anarchy existed, not a state of government. It was a despotism of a democratic mob united with the despotism of a democratic dictatorship. When the passion of the hour had burned itself out and Robespierre, Marat, Danton and other leaders had fallen, France turned again to a monarchy for self-preservation. For the second time the people, in 1848, overthrew the monarchy and re-established a republic. The king, Louis Phillippe, abdicated and fled to England and a new constitution was adopted, providing for a President, a council of state and an assembly elected by popular vote. Louis Bonaparte was elected the first President and in 1852

by an almost unanimous vote he was accepted as hereditary emperor under the name of Napoleon III. The second empire lasted for 18 years and was succeeded by the third republic in 1870, which was in stable and unthreatened existence in 1918. The defeat of France by Germany in 1870 led to the overthrow of Napoleon III and the Napoleonic dynasty. For almost half a century France, the republic, has steadily grown in wealth and power, and is reckoned as one of the strongest nations of Europe. Its government is a pure democracy and authority is vested in a President elected for seven years, by the Congress and a Senate and Chamber of Deputies elected by the people, the latter by popular vote and the former by an electoral body.

Switzerland.—The Swiss republic dates from 1291, when the men of Uri, Schwyz and Unterwalden entered into a defensive league. Other cantons were added to the league until, in 1798, under the influence of France, the Helvetic Republic was formed with a regular constitution. In 1815 the perpetual neutrality of Switzerland and the inviolability of her territory was guaranteed by the powers of Europe. The republic is non-centralized, each canton having independent local powers. The federal government consists of a state council of members elected by the separate cantons and a national council elected by the people as a whole. The President and the Vice-President are elected for terms of one year by the federal assembly. Universal suffrage prevails and the compulsory referendum and popular initiative are features of legislative procedure.

Andorra.—Andorra, in a valley of the eastern Pyrenees, between France and Spain, is under the joint-suzerainty of these two countries. It was declared a free state by Charlemagne and has always retained its independence. It is governed by a council of 24, elected by the people, and the chief executive is a member of the council, elected for life by his associates. It has a population of less than 10,000.

San Marino.—San Marino, in Italy, is the oldest existing republic in the world. It embraces five villages with a population of about 11,000. The general government is entrusted to a council of 60, the chief officer being termed captain-regent.

The United States.—On the western hemisphere, with the exception of the Dominion of Canada and the smaller dependencies of Great Britain, France and Holland, every country is under a republican form of government. The United States of America is the oldest of these republics, the most extensive in territory and the largest in population. It stands among the world's greatest powers and in its influence it dominates the Western world. As a nation, the United States originated in the colonies of Great Britain that existed in the eastern, middle and southern sections of the New World in the 18th century. The inhabitants of these colonies were mostly of English origin but they rebelled against the rule of the mother country and united in establishing themselves as a free nation, under the Declaration of Independence in 1776. In form of government, the country is a non-centralized republic, and its constitution and form of government have been the pattern upon which all republics have been

modeled since the beginning. The President, who serves for a term of four years, is chosen by an electoral college, the members of which are elected by popular vote in the several States and represent the State-at-large and its Congressional districts. The Senate consists of two members from each State, elected by popular vote. The House of Representatives consists of members elected by popular vote in the separate Congressional districts in the several States. There is a Federal judiciary and, in foreign relations, interstate commerce, army and navy affairs, navigation and postal service, the Federal government is supreme. Each State is wholly independent in the control of its own affairs, having a form of government like the Federal, a governor, upper and lower houses of legislation and State judiciary. The nation has had a prosperous existence. It has been engaged in wars with England, France, Mexico and Spain and passed through, 1861-65, the greatest Civil War the world has ever known. It has expanded until now it covers the northern part of the hemisphere from the Atlantic to the Pacific and from Canada on the north to Mexico on the south. At a result of the Spanish-American War, the republic entered upon a colonial policy and extended its operations across the Pacific. It acquired the Philippine Islands by the treaty of 1898 and also the islands of Porto Rico and Guam, and all three have been held as colonial dependencies. Hawaii, whose white citizens had revolted from native monarchical rule and set up an independent republic, was annexed to the United States in 1898 as a Territory. For centuries the island of Cuba was under the rule of Spain. Insurrection followed insurrection against the Spanish power, but Cuba was held fast as a Spanish colony until the Spanish-American War, of which it was the cause. In the peace treaty between the United States and Spain, Cuba was relinquished. It was temporarily held by the United States pending the establishment of a stable home government, but in 1901 this was accomplished and in the following year, with Tomas Estrada Palma at its head, free Cuba took its place as the latest republic in the world. Universal suffrage with educational qualifications prevails, and the form of federal government and methods of election follow closely those of the United States of America. In 1917 and 1918 the United States was engaged in a stupendous war against the central allied powers of Germany, Austria and Turkey. In this she was one of the allies of England, France, Italy, Belgium and other allied nations fighting to sustain the cause of democracy. See WAR, EUROPEAN.

South America.—The South American republics are 10 in number, Argentine, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay and Venezuela. Early in the 16th century Spain invaded and subjugated Peru and achieved a conquest of almost the entire South American continent. For three centuries she was able to master and hold not only that portion of the hemisphere, but also the territories of Mexico and Central America and a great part of what is now the western and southwestern section of the United States. In South America she divided power only with Portugal. In the first quarter of the 19th cen-

ture most of the South American states achieved their independence and established themselves under republican forms of government. The agitation for emancipation broke out almost simultaneously in different parts of the continent but was not always quickly or easily successful. In 1810 the Chileans revolted against the king of Spain and a junta which met at Santiago elected the Marquis de la Platte, a native Chilean, President of the republic, but it was not until 1818 that independence was formally proclaimed. A constitution was voted in 1833. The Argentine provinces freed themselves from the Spanish yoke in 1810, but were immediately embroiled in disputes and contentions among themselves. The history of the republic until comparatively recently was a record of anarchy, civil contentions and warfare with European nations and sister republics. The existing constitution was adopted in 1853. Paraguay gained its independence in 1811 and after a short period of government by two councils, the supreme power was seized in 1815 by Dr. José Gaspar Rodríguez Francia, who exercised autocratic sway as dictator until his death in 1840. A state of anarchy followed and lasted two years, after which a National Congress put two consuls at the head of affairs. The dictatorship of President López followed, and in 1870 a new constitution was voted, making the country a full-fledged republic. Bolívar, the liberator, began his work for freeing South America from the Spanish yoke in 1809. After alternate defeat and success, he finally triumphed, and in 1819 united New Granada and Venezuela as a republic under the name of Colombia. In 1832 the republic split up into Venezuela, Ecuador and New Granada, and after several changes in constitution and in state membership, the country became, in 1886, the republic of Colombia. In 1820 San Martín, at the head of an invading army from the republic of Chile, entered Peru, drove out the Spanish authorities and proclaimed himself protector. Two years later Simon Bolívar, at the request of San Martín, entered the country and was appointed dictator. Under Bolívar, Peru achieved her full freedom. A succession of civil wars and constitutional changes followed during a period of over 30 years. A constitution, in the modern spirit, was proclaimed in 1856 and under it the republic has continued since. In 1825 the republic of Bolívar was instituted from the southern province of Peru by Simon Bolívar and named after its founder. The constitution then formed underwent important modifications in 1828, 1831, 1863 and 1880. For nearly two centuries the territory of Uruguay was the subject of almost constant contention between Brazil and Buenos Aires. In 1828 by the mediation of England, the northern part of the territory was ceded to Brazil and the southern part was erected into the republic of Uruguay, having declared its independence three years before. The constitution was established in 1830. The republic of Ecuador was established in 1830 as the outcome of a civil war which separated the members of the original republic of Colombia formed by Simon Bolívar upon the ruins of the Spanish kingdom of New Granada. Its constitution was voted in 1844 and modified in 1887. Venezuela also had its

origin in 1830 in the break-up of the Bolívar republic of Colombia. The Spanish flag was cut down in this province in 1811 and the struggle against Spain was carried on until 1823, when the Spanish troops were completely expelled. The charter of fundamental laws put into force in 1830 has been several times modified. Of all the South American countries, Brazil remained longest under a monarchy. It was an appanage of Portugal until 1815. The royal family of Portugal fled to Brazil in 1807 and establishing the throne there; the colony was declared a kingdom in 1815. When the royal family returned to Portugal in 1821, Brazil declared itself independent with Dom Pedro, son of Dom Joao VI of Portugal, as emperor. The throne came to Dom Pedro II in 1831 and he ruled until 1889, when, by a revolution, he was deposed and, with his family, exiled to Europe. Brazil was declared a republic under the name of the United States of Brazil. In origin, in career and in form of constitutional government, the South American republics show striking similarity. The cry for liberty expressed in the French Revolution and more especially the successful establishment of the republic of the United States of America inspired the patriots of the southern part of the hemisphere to the struggle for freedom. In establishing constitutional government, they took pattern from the United States of America. Universal suffrage with age and educational qualifications prevails. The central government in each republic consists of a President and two legislative branches, a Senate and a House of Representatives or House of Deputies. Methods of electing the President and members of the Senate and the House vary somewhat, but directly or indirectly adhere to the principle of the rule of the people. The states or provinces that constitute each republic generally have full freedom in their local affairs, although in several republics federal officers have more or less control. Theoretically, most of the South American governments are non-centralized republics. Practically the federal government is a strongly centralized power. The population may be broadly divided, as far as government is concerned, into two classes, the illiterate, ignorant and indifferent and the educated and enlightened, among whom are to be found leaders ambitious and turbulent. Consequently the history of these governments has been almost uniformly a story of intrigue, revolution, sanguinary civil war and domestic upheaval. Presidents have held themselves in power by bayonets, usurpers have arisen supported by the army and dictators have ruled under the name of presidents and nominally so elected.

Central America.—The Central American republics are Costa Rica, Guatemala, Honduras, Nicaragua, San Salvador and Panama. Central America, after freeing itself from Spain in 1821, until which time it was known as the kingdom of Guatemala, was attached to the kingdom of Mexico. In 1823 Guatemala, Honduras, Nicaragua and San Salvador formed an independent federal union, under the name of the United States of Central America. Subsequently the states dissolved this alliance and became independent, Guatemala in 1847, Honduras in 1839, Nicaragua in 1858, Costa Rica in 1829 and San Salvador in 1853. These repub-

lics are republics in little more than name. Each has a constitutional government and theoretically possesses popular suffrage. In form the federal authority consists of a President and two legislative houses. In fact, the government is always in the hands of a few strong men who exercise autocratic power. Revolutions are frequent, the factions resort to arms whenever desire or opportunity impels and there is frequently no security of life or property. Panama, which may, perhaps, be considered as belonging almost as much to South America as to Central America, was originally part of the republic of Colombia. When the latter country hesitated in coming to an understanding with the United States in regard to the construction of the Panama Canal in 1903, the department of Panama seized the opportunity to secede from her associate. There was a bloodless revolution of a few days. Panama declared itself an independent republic and was recognized at once by the United States. She is now practically under the protection of the United States. See PANAMA.

West Indies.—In the West Indies is an island on which there are two nominal republics, known as the Black Republics. Hayti, governed first by Spain and then by France, became free in 1793. First the free colored population gained the franchise in 1791 and then all the negroes in 1793 under the leadership of Touissant l'Ouverture acquired freedom. In the last century the island had varying fortunes, sometimes under English, French or Spanish domination, being twice an empire and several times a republic. San Domingo Republic, on the eastern end of the island, was established in 1844. The government is in the hands of an elected President and two legislative houses, but control of affairs is constantly being changed by revolutions and the setting up of dictatorships. The republic of Hayti, on the western end of the island, has a similar history, under a like form of government proclaimed in 1867. In both republics the government is in the hands of negroes and mulattoes who constitute almost the entire population.

Mexico.—From the time that Cortes conquered Mexico, 1519-21, that country remained in the hands of Spain for three full centuries. Finally in 1810 rebellion broke out and after 11 years' struggle, Iturbide, the liberator, was proclaimed emperor. Upon the deposition of Iturbide, the army organized a republic. For nearly half a century there was only the merest semblance of government of any kind. The history of the period is a record of anarchy, intrigue, revolution, military leaderships and dictatorships. In 1857 a constitution was formed, but the existing condition of internal disorder did not terminate. The French made war against Mexico and Maximilian was created emperor by a provisional government in 1862. Upon the execution of Maximilian in 1867 the republic was more firmly established, but it was not until as late as 1878 that under Porfirio Diaz the country became settled. In 1911 a revolution broke out against the Diaz government and a bloody civil war followed for nearly five years, finally terminating in the triumph of the Constitutional party under Carranza who became Constitutional President. (See MEXICO—HISTORY). Mexico is a federa-

tive republic, divided into states, each of which manages its own local affairs, while the whole are bound together by fundamental and constitutional laws. The powers of government are exercised by a President, Senate, House of Representatives and judiciary.

Africa.—On the western coast of Africa is the republic of Liberia which represents an attempt made by American philanthropists to prove the capacity of the negro race for self-government. Founded in 1820 by the American Colonization Society, it was organized as an independent state in 1847 and acknowledged first by England and other nations of Europe and by the United States in 1861. The constitution of the republic is copied from that of the United States and the right of suffrage is inalienable to every male citizen who owns real estate. As no white man can be admitted to citizenship and as none but citizens can hold real estate, the republic is in absolute control of men of the African race. It is a fairly prosperous country but is heavily loaded with debt and has been constantly torn by political disorder. Executive power is vested in a President and legislative power in a Senate and House of Representatives. In the southern part of Africa the Boers of Dutch origin founded two republics. The Orange Free State was established by Boers who in 1836 and following years quitted Cape Colony in order to separate themselves from British rule there. In 1854 the independence of the republic was declared and a constitution proclaimed. The legislative authority is vested in a single popular assembly elected by the suffrage of adult white males having property qualifications. The President is elected by universal suffrage. Similar to the history of the establishment of the Orange Free State is that of the South African Republic, known also as the Transvaal. It was formed by Boers who moved from Cape Colony and Natal and in 1852 its independence was acknowledged by Great Britain. A constitution was adopted in 1858. There was never lasting peace between the Transvaal and its British neighbors to the south. In 1877 the country was annexed to Great Britain, but the Boers gained their freedom again under the treaty of 1881. Great Britain acquired suzerainty over the foreign relations of the republic in 1884. Friction between the two countries continued unceasingly and finally culminated in open war in 1899 which resulted in the defeat of the Boers and the addition of the republic to the South African possessions of Great Britain.

GEORGE EDWIN RINES

REPUDIATION, a term signifying the refusal of a national or State government to pay pecuniary obligations, especially bonds or other evidences of borrowed money. Nearly all leading countries have, at some time in their history, repudiated indebtedness. England has never repaid money borrowed for public use from a Florentine merchant by one of the Edwards, and prominent London bankers were ruined when Charles II confiscated their fund deposited in the royal exchequer. France repudiated the paper money called assignats a one-thirtieth of its value. The United States failed to redeem the Continental currency. In the disastrous financial period of 1840 and several subsequent years, the States of Illinois

Indiana, Pennsylvania, Maryland, Mississippi, Michigan and Louisiana suspended payment of interest on their debts incurred in promoting public improvements, but all of them, except Michigan, Mississippi and Louisiana, eventually fulfilled their obligations as to the capital of the debt. Governor McNut of Mississippi advocated "repudiating the sale of certain of the State bonds," on account of alleged fraud and illegality in the issue, and this was the origin of the popular use of the term "repudiation" as applied to that course on the part of a State. The legislature of Mississippi refused to accept the governor's suggestion, but while the bonds were not formally repudiated, they were not redeemed. Michigan provided for the repayment of money actually received, repudiating obligations shown to have been issued without a fair equivalent, even although in the hands of innocent parties. Louisiana paid her creditors in depreciated State bonds. Minnesota refused to honor certain railroad bonds guaranteed by the State, in 1858, claiming that the railroads had failed to comply with the conditions on which the guarantee was given. The question of paying this indebtedness was agitated for many years, and finally in 1880 Minnesota compromised by agreeing to pay 50 cents on the dollar.

After the Civil War the Southern States fell largely under the rule of unscrupulous politicians known as "carpet-baggers," intruders from the North took advantage of the prostrate condition of the Southerners, and inflicted much wrong and injustice. Obligations were issued for which no reasonable equivalent ever reached the State treasuries, and the impoverished communities, when the native whites obtained supremacy again, found themselves deeply in debt. Georgia, Virginia, North Carolina, South Carolina, Florida, Alabama, Mississippi, Louisiana, Arkansas and Tennessee either scaled their debts to a figure which represented value received, or refused to pay obligations alleged to be tainted with injustice and corruption. In all, the Southern States scaled down their indebtedness from about \$235,000,000 to a little more than \$100,000,000. While there was rough justice in these reductions, yet the natural result was that foreign investors were shy of State securities for many years. Cities and towns of the United States have sought at times to repudiate a portion of their debts, and in case a city actually is bankrupt, it is not clear how the debt can be collected. Under the 11th Amendment to the national Constitution, States cannot be sued by individuals, and creditors are, therefore, powerless to attempt collection in the courts.

Spanish-American republics, with some honorable exceptions, have persistently ignored their financial obligations. An attempt by France, England and Spain, to collect debts due by Mexico, was the cause, or more correctly the excuse, for the ill-fated effort to establish an empire in Mexico, with Maximilian on the throne. Since the growth of Mexico in prosperity and position among the nations, under the beneficent despotism of Diaz, the Mexican government has voluntarily taken steps to meet its financial obligations.

REPULSION, in *physics*, the force which impels certain bodies or their particles to re-

cede from each other. Apparent repulsion exists when there is a greater attraction elsewhere. No repulsion exists between bodies at sensible distances, except when they are in certain electric or magnetic states, in which case the repulsions between them are in the inverse ratio of the square of the distance. At insensible distances, some influence keeps the particles of a body from being in absolute contact, whence results the phenomenon of elasticity. The motions produced by heat are also a cause of strong molecular repulsion. The molecules of gases are always in a state of mutual repulsion. Compare **ATTRACTION**; **MAGNETISM**.

REPUTED OWNERSHIP, in *law*, is a phrase used of one who has to all appearances the right and actual possession of property. "The false credit raised by a person exercising all the rights of ownership over a subject not his own has led to the adoption of the rule that the creditors of the reputed owner may take the subject as if it were his own." See **BANKRUPTCY LAW**.

REQUENA, rā-kā'nā, Spain, town in the province of Valencia, 40 miles west of Valencia. The remains of the tower of the ancient church of San Salvador; the castle towering above Las Cabrillas (a prominent summit), and the ruins of walls which formerly surrounded the city, are the chief points of architectural interest. The chief industry consists in the culture of silk, saffron, grain, fruit and wine. Pop. 14,500.

REQUEST, Letters of, (1) in *law*, a written request by one court asking another court in a different jurisdiction for assistance in performing a judicial act, as to enforce a monition, execute a judgment or the like. They are used in the United States in admiralty practice. They have been superseded to some extent, both in the United States and England, by commissions for taking evidence. (2) In *ecclesiastical law*, a written request to send a cause to another court. Usually letters of request lie only in cases in which an appeal would be proper.

REQUIEM, rē'kwī-ēm, the Roman Catholic mass for the dead, named from the first word of the Introit "*Requiem aeternam dona eis, Domine*." While the term covers the entire mass it is more distinctively employed to designate the musical setting for the mass; and in common usage has come to mean a musical service or hymn for the dead. Among the most famous musical settings for the Requiem mass are those of Palestrina, Vittoria, Mozart, and two by Cherubini and Verdi.

REREDOS, rēr'dōs, in church architecture, usually the screen back of the altar, which is adorned with sculptured work comprising the tabernacle, niches, statuary and the like; in some great cathedrals, for example, in England, the cathedrals of Durham, Winchester and Saint Albans, the reredos is a mass of most elaborate carving which reaches nearly to the graining.

RES JUDICATA, rēz joo-di-kā'tā, a law term meaning that the subject matter of an action has been already decided by a court of competent jurisdiction. A matter so decided cannot again be made a ground of action between the same parties.

RESACA, rā-sā-lā, Battle of. While the armies of Generals Thomas and Schofield were threatening an advance from the north on Dalton, Ga. (q.v.), General Sherman ordered General McPherson, commanding the Army of the Tennessee, to move southward through Snake Creek Gap and interpose between Dalton and Resaca. McPherson moved from Gordon's Springs, 8 May 1864, his advance bivouacked that night in the Gap and next morning pushed through it, defeated a brigade of Confederate cavalry at the eastern end of it, and approached to within a mile of Resaca, on the Oostanaula, where he found the enemy in position too strong to be attacked; and being unable to find a good road by which he could quickly reach the railroad, north of Resaca, and fearing an attack upon his own left flank, he prudently withdrew, after some severe skirmishing and took a strong position near the east end of Snake Creek Gap. Sherman now resolved to transfer the greater part of his army to join McPherson. Howard's Fourth corps and a small force of cavalry were to demonstrate on Buzzard Roost Gap and occupy Confederate attention north of Dalton. On the 10th Hooker's 20th corps moved through Snake Creek Gap and joined McPherson. Palmer's 14th corps and Schofield's 23d corps followed, and on the 12th the whole army except Howard's corps and the cavalry with it, was through the Gap. On the morning of the 13th McPherson, preceded by General Kilpatrick's cavalry, led the advance on the direct road to Resaca. Thomas, with the corps of Palmer and Hooker, was to move on McPherson's left, and Schofield on the left of Thomas. The country was covered by dense forest, and the movement of troops was difficult. Kilpatrick drove the Confederate cavalry to within two miles of Resaca, and was wounded, and his cavalry wheeled out of the road, allowing McPherson to pass, who, encountering the Confederate pickets near Resaca, drove them in and occupied a range of bald hills, his right on the Oostanaula, about two miles below the railroad bridge, and his left abreast the town. Thomas came up on McPherson's left and faced Camp Creek. Schofield worked his way through dense forest and came up on the left of Thomas, but it was noon of the 14th when these movements were completed, at which time Howard's Fourth corps, following Johnston from Dalton, had reached a position about a mile north of Schofield's left. Johnston abandoned Dalton about midnight of the 12th, and during the 13th formed his army covering Resaca, Polk's and Hardee's corps west of the place, facing west and covering the railroad bridge and a trestle bridge. Polk rested his left on the Oostanaula, and Hood's corps on the right of Hardee's extended across the railroad to the Connesauga, facing to the northeast. Wheeler's cavalry was on the right, and Jackson's cavalry on the left guarded the Oostanaula from Resaca to Rome. There had been severe skirmishing on the afternoon of the 13th between the troops of McPherson and Polk, and it was renewed on the morning of the 14th, and in the afternoon McPherson carried a bridge on Camp Creek, crossed it and secured a commanding position very close to Polk's main line and intrenched. Confederate efforts to retake the position were repulsed. Farther to the left Palmer's 14th

and Schofield's 23d corps became engaged with Hardee on Camp Creek; parts of Schofield's corps were repulsed with great loss, another part succeeded in making a lodgment beyond the creek. Two divisions of Howard's corps coming in from the north were sent to Schofield's support, leaving Stanley's division in echelon to the left. Hooker's corps was sent to the left. Johnston had noted the exposed position of Sherman's left and ordered Hood, with the divisions of Stewart and Stevenson to attack and turn it. Late in the afternoon Hood attacked Stanley, outflanked him and was driving him back when the advance of Hooker's corps, Williams' division, came up, repulsed Hood and drove him back to his intrenchments. Skirmishing was resumed along the entire line on the morning of the 15th, and Sherman ordered an advance of Hooker on the left, and the two divisions of the 23d corps were withdrawn from the centre and marched to the extreme left in support. It was after noon when Hooker advanced, Butterfield's and Geary's divisions on the right and centre, and Williams' on the left. Hood, with the divisions of Stevenson and Stewart, supported by three brigades from Polk's and Hardee's corps, made a simultaneous advance from his works. Stevenson on his left was struck first by Butterfield and then by Geary, before he had gone far from his works, and after a severe fight was driven back to them, leaving a four-gun battery in advance of his line, which remained between the two lines until night, when it was secured by a detachment of Geary's division. On Hood's right Stewart's division swung to the left, drove Williams' skirmishers from the railroad and, crossing, assaulted Williams' main line most vigorously, but was bloodily repulsed and fell back to its intrenchments. A part of Schofield's corps on Hooker's left took part in this engagement. Hooker's loss was over 1,600. On the 14th Sherman had ordered a pontoon-bridge to be thrown across the Oostanaula at Lay's Ferry, in the direction of Calhoun, and Sweeny's division of the 16th corps was ordered to cross it and threaten Calhoun. Sweeny crossed one brigade, drove some Confederate cavalry from the opposite bank, then hearing that the Confederates were crossing above him, he withdrew the brigade and retired his entire division half a mile to a less exposed position. On the morning of the 15th he moved back to the river and crossed it, laid a pontoon-bridge and constructed works. Here he was fiercely attacked by Walker's Confederate division, which was repulsed. The presence of a part of Sherman's army east of the Oostanaula determined Johnston to retreat, and that night he abandoned Resaca and marched for Calhoun. Sherman occupied Resaca on the morning of the 16th and started in pursuit. The Union loss at Resaca was about 600 killed and 2,147 wounded. The Confederate loss was about 300 killed, 1,500 wounded and 1,000 missing. Consult 'Official Records' (Vol. XXXVIII); Cox, 'Atlanta'; Van Horne, 'History of the Army of the Cumberland' (Vol. II); Sherman, 'Personal Memoirs' (Vol. II); The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV); Johnston, 'Narrative of Military Operations.'

E. A. CARMAN.

RESACA DE LA PALMA, *rā-sā'kā dā lā pal'mā*, Battle of, in the Mexican War (q.v.). After the battle of Palo Alto (q.v.), 8 May 1846, the Mexican general Mariano Artista fell back on the road to Matamoras and took position in a ravine called Resaca de la Palma (Palm Ravine) in Cameron County, Tex., four miles north of Brownsville. Having been reinforced by 2,000 men, bringing his army up to about 6,000 infantry and 800 cavalry, he determined to resist the further advance of Gen. Zachary Taylor (q.v.) and the American army of about 2,200 troops. About noon of 9 May, having sent his wounded back to Point Isabel, Taylor began his advance and came upon the Mexicans, strongly intrenched in the ravine which forms a natural breastworks, defended in front by artillery and well secured in the rear against the possibility of being flanked. On the road along which the Americans must approach the Mexicans had established a three-gun battery so as to rain a shower of grape-shot on the advancing enemy. Perceiving that the severest struggle must take place on this road, Taylor, after sending some troops into the chaparral on either side of the road, ordered Capt. Charles A. May with a squadron of dragoons to take the battery. Though the Mexican shot tore his ranks to pieces, May gallantly executed this task, drove the Mexicans from their guns and captured General La Vega, but was gradually being driven back by superior numbers when Taylor ordered the 5th and 8th infantry to charge. This decided the battle; the Mexicans fled from their positions and were put to total rout, the pursuit being halted only at the river. Taylor might have entered Matamoras at once but took time for his troops to recover from their labors and did not enter the town until the 17th, without encountering any resistance from Arista. Taylor's loss was 39 killed and 83 wounded, while the Mexican loss is variously stated, though it probably was between 500 and 600. Taylor then remained practically inactive until he had fought the battle of Monterey (q.v.). Consult 'Executive Documents,' 30th Congress, 1st session, Vol. VII, No. 60, pp. 293-296; Montgomery, H., 'Life of Taylor,' pp. 141-187; Howard, 'Life of Taylor,' pp. 119-130; Bancroft, H. H., 'Mexico,' Vol. V, chap. XIV; Ladd, H. O., 'The War with Mexico,' pp. 59-69; Wiley and Rines, 'The United States,' Vol. VII, pp. 197-200.

RESCISSION, *rē-sish'un*, a legal term designating the act of rescinding or abrogating a voidable contract, that is, a contract in force but which owing to some injustice, infirmity or demand of justice or public policy may be annulled, and refers to the dissolution of the contract through the will of the parties involved instead of through an action in court, in which case the term "cancellation" is employed. The rescission may take place through the inclusion of a clause providing for it in the contract; through evidence of fraud practised when the contract was made; inadequacy of consideration through the employment of fraud; the exercise of undue influence, as resulting from confidence and friendship, the relation of husband and wife, parent and child, principal and agent, trustee, executor or administrator and heir or legatee; mistake in drafting the contract, or misunderstanding of the terms em-

ployed, or want of authority on the part of an agent or officer; the contractors of minors on the application of the minor, and of people insane or under the influence of intoxicants, or made under duress or stress; failure of one of the contracting parties to perform his part of the contract, either through inability or refusal; failure of consideration, or non-existence of subject matter, but not through depreciation after the consummation of the contract; and, in the case of a selling contract, the discovery before transfer of possession, that the purchaser intends making illegal use of the purchase. Insurance policies cannot be rescinded by either party without the consent of the other unless the right of rescission be included in the policy. The right to rescind belongs only to the party without fault. The act of rescission may be effected by an act of party, notifying the other of intention; or by an act in equity in order that the instrument may not later be used to the annoyance or disinterest of an innocent party. Right to rescind is lost through unreasonable or inexcusable delay, or by an act at law to recover damages; but an action in court for recovery of damages or property may follow rescission. The party rescinding must place the other *in statu quo*; he may not rescind and retain the benefits derived from the contract; and no rights received through it remain upon its rescission.

RESCRIPT, the term applied in Roman law to the answers of popes and emperors to questions in jurisprudence propounded to them officially. The rescripts of the Roman emperors constitute one of the authoritative sources of the civil law. These were usually addressed to the provincial magistrates, to corporations or even to individuals. The rescripts of Justinian admitted into the code have acquired great authority. The rescripts of the popes of Rome are still referred to as fundamental in Catholic theology.

RESCUE, (1) *in law*, the forcible setting at liberty of a person or thing in legal custody. The punishment varies, depending on the circumstances. In the case of persons, the rescuer was formerly held to be guilty of the same degree of crime as the prisoner if the former knew the prisoner was in lawful custody at the time. (2) *In international law*, the retaking of a prize by the persons taken with such prize.

RESCUE, or **SCHRADER'S BROME GRASS**. See GRASSES IN THE UNITED STATES.

RESECTION, *in surgery*, the operation of cutting out the diseased bone of a joint. It frequently obviates the necessity of amputating the whole limb, and by the removal of the dead parts leaves the patient a limb which, though shortened, is in the majority of cases better than an artificial one. Resection, which is one of the triumphs of modern surgery, became a recognized form of surgical operation in 1850.

RESERVATION, *in law*, (1) the withholding of an interest in property granted, or the interest so withheld. (2) Notice that specific rights are retained. (3) That part of a deed in which the vendee reserves an interest in the property granted. A reservation must be carefully distinguished from an exception. The latter denotes a specific part of land not conveyed by the grantor, while a reservation de-

notes that the grantor reserves a right in land which he has conveyed. This right cannot be granted to any one but the grantor of the land. A reservation may be of a life estate or even a right of fishing. (4) In the United States the withholding of certain territory, as for public uses, or the territory so held.

RESERVATION, Papal, of Benefices, the taking of the bestowal of certain Church benefices and dignities out of the hands of the local church rulers and the attribution to the Roman Pontiff of the right to confer the same; or, what amounts to the same thing, the requiring of bishops, chapters and other persons or ecclesiastical bodies possessing the right of conferring benefices, that in case of vacancies they should bestow such benefices on persons nominated by the Pope. One reason alleged in favor of this practice was that thus the several national churches were linked more closely by personal ties of gratitude and affection to the central see, and through it to each other; another was that thus the Supreme Pontiff was provided with the means of rewarding those who had labored meritoriously in the cause of the Holy See and the Church Catholic.

RESERVATION OF THE EUCHARIST, the keeping of the sacramental species against emergent occasions, as the communion of the sick in their homes, for the Mass of the Presanctified on Good Friday, for the rite called Benediction of the Blessed Sacrament and for the perpetual adoration. Mention is made in authors of the times immediately following the Apostolic Age, of the custom of the bishops sending to one another the Eucharist in token of Christian union and fraternity. Saint Ambrose (4th century) tells of the Eucharist being carried by lay persons; in the Middle Ages this custom was still in vogue. Thomas à Becket carried the Eucharist with him when he went to meet Henry II and Saint Louis carried the sacred species with him on his Crusade. The sacred host is now customarily reserved in all Catholic churches whether of Latin or Oriental rite, being kept usually in the tabernacle of the high altar in the Latin Church and in Greek churches in a special receptacle, *artophorion*, behind the altar; whenever it is reserved a lamp is kept ever burning before it.

RESERVATIONS, Game. See **GAME PRESERVES**.

RESERVATIONS, Indian. When the settlers from Europe came to realize that the Indians had human rights, and ought not to be enslaved or exterminated, the rule was generally adopted of confining the tribes to reservations, both for their own protection from unprincipled whites and for the security of the white population. New York, Massachusetts, Connecticut, Rhode Island and other States enforced this policy in the colonial period and after independence, and the United States government has carried it out from an early date. Southern tribes east of the Mississippi were removed to the Indian Territory, designated by solemn pledge of the national government as a permanent home for their race, and there some of the tribes have achieved a high degree of civilization and gained considerable wealth. They are largely intermarried with whites and to some extent with negroes, whom they formerly held as slaves. Other tribes, chiefly from

the Southwest, have been gathered into the Indian Territory, but large Indian reservations, mainly of Sioux, are still maintained in the Northwest, and altogether the various tribal reservations in the different States and Territories number about 185. The reservations are carefully guarded against intrusion by unscrupulous whites, and provision is made for the intellectual and physical welfare of the Indians and for leading them to adopt civilized methods of self-support, instead of depending on the chase which now offers only the most precarious returns, or on government aid, which, however, is not withdrawn under any circumstances while an Indian is in need of it. The sale of intoxicating liquor to Indians is severely punished when detected, but the law is frequently evaded.

In 1917 the Indian population, as returned by the leading States having reservations, was as follows: Oklahoma, 119,108; Arizona, 44,617; South Dakota, 26,246; New Mexico, 20,853; California, 15,362; Minnesota, 11,777; Montana, 11,525; Washington, 11,181; Wisconsin, 10,216; North Dakota, 8,903; North Carolina, 8,118; Nevada, 7,944; Oregon, 6,612; New York, 6,272. No other State had as many as 4,000.

RESERVATIONS, Military. The United States government maintains military reservations in all the States and dependencies. Very many of these are used for rifle ranges; others for barracks, training grounds, cemeteries, fort and arsenals. They were extensively utilized for the war in 1917, and in many cases new lands have been acquired for military training. See **RESERVE**.

RESERVE, in military affairs, has several significations. In battle the reserve consists of those troops not in action, and destined to supply fresh forces as they are needed, to support those points which are shaken and to be ready to act at decisive moments. Napoleon's guard and his disposition of them, are models. They often decided the victory when the enemy felt sure of success. The reserve of ammunition, the supply of warlike stores placed close to the scene of action to allow of the supply actually in the field being speedily replenished.

The term reserves is also applied to the forces which are liable to be called into the field on great emergencies, for the purposes of national defense; which have received a military training but follow the ordinary occupations of civil life and do not form part of the standing army. Such reserves now form a part of national troops organized on a great scale. They are entitled to wear "U.S.R.", on their uniforms.

In 1917 the United States army began to establish reserve officers' training camps and by 1 Jan. 1918 had issued more than 60,000 officers' commissions from these camps. A third series of such reserve officers' camps was started January 1918. (See **RESERVATION MILITARY**). The United States naval reserve force was authorized by Congress, 29 A. 1916. Only citizens are enlisted; the pay \$12 a month minimum. The fleet naval reserve is composed of retired naval officers and men who receive retainer pay of \$50 per month and upward, being liable to be called to serve at their former rank. The United States coast guard reserve is composed of ex-merchant seamen who are liable to be called to duty.

in the regular navy or on auxiliary vessels. They receive a small retainer pay, varying with their previous earnings. There is also a naval auxiliary reserve, made up of officers and men who have been listed by the Navy Department as desirable for enlistment. The naval coast defense reserve is composed of owners and operators of yachts, motorboats, or men who are familiar with coasting, radio work, handling mines and torpedoes, etc. The naval reserve flying corps is operated on similar lines and is open to men who understand something of aviation. There is also a medical reserve corps connected with the navy.

RESERVOIR, a large and commodious receptacle for storing water for any purpose, but more commonly for supplying cities and towns, feeding canals, driving machinery and the like. A dam differs from a reservoir in that the name applies only to the artificial structure that holds back the water, while the reservoir includes also the entire artificial lake and its appurtenances. The construction of a reservoir is of much importance and requires great engineering skill. In the selection of a site the great object should be to choose a position which will give the means for collecting a large supply of rainfall with as little recourse as possible to artificial construction. An advantageous site would be, for instance, in the narrow gorge of a valley through which a stream passes, and at a place where the gorge widens out on the side looking toward the source of the stream. Particular care, however, is necessary to discover whether the position chosen communicates with the courses of underground waters or springs, as disastrous results have frequently been occasioned by ignoring this. As a general rule the best and safest method is to establish reservoirs in valleys filled in with clays derived from the decomposition of the primary formations, which are very slightly permeable. The embankments or dams may be constructed either of masonry or earth-work, the latter being generally the more economical method. Where the reservoir requires to be constructed on perfectly level ground the excavation should be calculated so as to equal the embankment. The earth-work of dams should be as much as possible of material—such as a mixture of clay and gravel—which would resist the infiltration of the water; but as it is impossible always to obtain such material in sufficient quantities, engineers have recourse to what is termed a *puddle-wall*, formed in the middle of the embankment. This wall is constructed of well-worked clay, the foundation of the puddle being a trench dug down to impervious rock or clay, and its breadth should be on an average about one-third the height of the embankment. The inside slope of the embankment is usually 1 perpendicular to 3 horizontal, sometimes it is steeper; the outside slope may be 1 perpendicular to 2 horizontal; and the height above the surface of the water is often 4 to 7 feet. The earth-work ought to be constructed of thin layers, carefully rammed so as to secure their equal settlement; the inner face requires to be protected by stones in order to resist the action of the water. The waste-weir, to admit of the surplus water flowing over, should be from 4 to 6 feet below the surface line of the embankment, built of strong

mason-work and of a width such that with a flow of 2 feet over the crown it should be able to discharge all the water brought down by the severest floods ever known to fall upon the basin supplying the reservoir. Many of the accidents that have occurred were due to deficiencies in the waste-weirs. In the reservoirs of which the dams are built of masonry there is no necessity for a waste-weir, as then the water may be allowed to overflow the wall; there being no fear of its endangering the work. The outlet at the bottom, by which the water to be used is drawn off from the reservoir, may consist either of a tunnel, culvert or iron pipes provided with suitable sluices, and these should be so constructed that access may be had to them even when the reservoir is full.

The true principles for the proportioning of masonry dams were not thoroughly investigated until about the middle of the 19th century and subsequently. This was first done by French engineers, and many such dams have since been constructed in France, Algeria, the United States, etc. The highest of all such dams is that of the New Croton reservoir, New York, its height being 248 feet; thickness at bottom, 185 feet; at top, 16. The first great masonry dam built in France on the newer principle was that of Furens (1860-65); height, 184 feet; thickness at bottom, 162; at top 11. San Mateo reservoir dam near San Francisco is 170 feet high; thickness at bottom, 176; at top, 20. The Periyar dam, India (1890-95), has a height of 173 feet; bottom thickness, 139; top, 12. In the famous reservoir of Alicante, Spain, executed 1579-94, the wall is 67 feet thick at the top, 112 feet at the bottom, and the height 141 feet. In England the preference is generally given to earthen dams. Sometimes natural lakes are used as reservoirs, instances of which are Loch Katrine, for the water supply of Glasgow, and Lake Thirlmere, in Cumberland, for the supply of water to Manchester. Distributing reservoirs for towns are generally built of masonry, but sometimes largely of steel. Reinforced concrete is now generally favored. They ought to be placed high enough to command the highest part of the town, and ought to be capacious enough to contain half a day's supply, their chief use being to store the surplus water during the night. Among notable modern storage reservoirs for towns are those of the Vyrnwy, for supplying Liverpool, containing 11,900 million gallons; Vehar (10,800 million gallons), for Bombay; San Mateo (31,000 million gallons), for San Francisco; and the New Croton (32,000 million gallons), for New York. See DAMS; ROOSEVELT DAM; IRRIGATION.

RESHT, resht, Persia, capital of the province of Ghilan, 150 miles northwest of Tcheran, near the Caspian Sea, and with a port at Enzeli. On the highway of commerce and travel between Europe and Persia, its geographical position has a special significance. There is an extensive manufacture and trade in silk. Pop. about 40,000.

RESIDENCE, the place which a man regards as his home, even although he may be absent from it for long periods of time. In the United States the question of residence is of the greatest importance, involving citizenship, the right to vote, to sue at law, marital relations,

questions of taxation and of the disposition of property by will or inheritance. It has, therefore, frequently engaged the attention of the courts, and the decisions have not been uniform. As a rule a man is assumed to reside where his family have their home, provided he is not separated from them by law, and provided they have not refused to accompany him to a fitting residence elsewhere. When a man has a summer and a winter home, the question of residence is usually determined by his personal declaration, and his payment of personal taxes in the place which he elects to call his residence. Courts regard with suspicion and disfavor change of residence for the obvious purpose of evading the laws of the State left, or of escaping taxation. Yet the man or woman who travels a great deal has an undoubted right to declare some place as his or her home and residence for all legal purposes. While the privilege may be, and doubtless is, often abused, yet the condition continues that residence is very largely a matter of where the individual declares it, provided he regularly spends a portion of his time there. See DOMICILE.

RESIDUE, in law, that which remains of an estate after all debts, legacies, and expenses are paid. If no residuary legatee is mentioned in the will, the residue goes to the next of kin.

RESIN. See ROSIN.

RESIN WEED. See COMPASS PLANT.

RESISTANCE, Electrical, that property of electrical conductors in virtue of which the passage of a current of electricity through them is necessarily accompanied by the dissipation of a part of the energy in the form of heat. It is manifested not only in a linear conductor like a wire, but also in solids of large extent in two or three dimensions, as when a current passes from one point to another of a sheet of metal, or of a mass like an ingot or casting. It is chiefly in connection with wires, however, that electrical resistance is of practical import-

ally dissipated in the form of frictional heat, and the energy of the moving current of electricity is similarly dissipated on account of the electrical resistance of the conductor through which it is passing. The unit in terms of which electrical resistance is measured is the "ohm," which may be taken as sensibly equal to the resistance of a column of mercury 106.3 centimeters long and one millimeter in cross-section, at the temperature of freezing water. (The British Board of Trade specifies that the mercury column shall be 106.3 centimeters long and that it shall have a mass of 14.4521 grammes. This is supposed to be identically the same definition, but it is more convenient for practical work, because in reproducing the ohm by means of a mercury column a glass tube would be filled with mercury and the sectional area of the column would be determined by weighing). (See also UNITS). The phenomena of electrical resistance have been studied, both mathematically and experimentally, by many eminent physicists; but the most important contributions to our knowledge are due to George Simon Ohm (for whom the "ohm" was named), and to James Prescott Joule. Ohm investigated the manner in which the flow of electricity through a conductor depends upon the resistance of the conductor, while Joule determined the law that governs the dissipation of energy from a conductor, in the form of heat. In the present article it will be assumed that the currents in the conductors are steady, that the electromotive forces in the circuits are constant and that the conductors are stationary (so that their coefficients of induction remain constant). The laws of Ohm and Joule may still be applied, though in a somewhat more generalized form, to conductors in which these three conditions are not fulfilled; but for the proper understanding of the phenomena in such case it is necessary to refer to the more advanced treatises on electricity.

FIG. 1.

ance, and it is only in this aspect that the subject will be here considered.

The passage of a current of electricity through a wire or rod has been likened to the flow of a current of water through a pipe, the water corresponding to the electricity, and the friction between the water and the pipe to the electrical resistance of the wire. The analogy is not perfect, but it is useful in forming a good conception of electrical resistance. The energy of the moving current of water is gradu-

ally dissipated in the form of frictional heat, and the energy of the moving current of electricity is similarly dissipated on account of the electrical resistance of the conductor through which it is passing. The unit in terms of which electrical resistance is measured is the "ohm," which may be taken as sensibly equal to the resistance of a column of mercury 106.3 centimeters long and one millimeter in cross-section, at the temperature of freezing water. (The British Board of Trade specifies that the mercury column shall be 106.3 centimeters long and that it shall have a mass of 14.4521 grammes. This is supposed to be identically the same definition, but it is more convenient for practical work, because in reproducing the ohm by means of a mercury column a glass tube would be filled with mercury and the sectional area of the column would be determined by weighing). (See also UNITS). The phenomena of electrical resistance have been studied, both mathematically and experimentally, by many eminent physicists; but the most important contributions to our knowledge are due to George Simon Ohm (for whom the "ohm" was named), and to James Prescott Joule. Ohm investigated the manner in which the flow of electricity through a conductor depends upon the resistance of the conductor, while Joule determined the law that governs the dissipation of energy from a conductor, in the form of heat. In the present article it will be assumed that the currents in the conductors are steady, that the electromotive forces in the circuits are constant and that the conductors are stationary (so that their coefficients of induction remain constant). The laws of Ohm and Joule may still be applied, though in a somewhat more generalized form, to conductors in which these three conditions are not fulfilled; but for the proper understanding of the phenomena in such case it is necessary to refer to the more advanced treatises on electricity.

is a standard volume of mercury, whose cross-section is one square millimeter, and whose temperature is that of freezing water; the resistance of such a column being (as noted above) one ohm for (say) each 106 centimeters of its length. The mercury column is arranged so that the current enters it at the left end; and the current is led away from the mercury column again by means of the movable wire *P*, whose point of contact with mercury can be shifted to the right or left, at will. The measurement consists in moving the point *P* until the two galvanometers *A* and *B*, one in each branch of the circuit, show that the currents in the two branches are precisely equal. We then know that the resistances in the two branches are also equal. In preparing the engraving it has been assumed that the equality has been observed to subsist when that part of the mercury column which is included in the circuit is 150 centimeters long, and, therefore, has a resistance of 1.5 ohms. If the galvanometers and connecting wires are identical in both branches, it, therefore, follows that the resistance of the coil *R* is also 1.5 ohms. The method of measuring resistances here described is presented in order to illustrate the fundamental idea of electrical resistance. In the practical measurement of resistances a more refined method, presently to be described, is employed.

It is found that the electrical resistance of a linear conductor of uniform cross-section is proportional (1) directly to the length of the conductor, (2) inversely to the area of its cross-section and (3) directly to a certain numerical factor characteristic of each material, and which is called the "specific resistance" of the material. The "specific resistance" (or "resistivity") of a substance is the resistance, at the freezing point of water, of a conductor composed of the given substance, and having a length of one centimeter and a cross-section of one square centimeter. The specific resistance of a given metal varies to a certain extent with the physical condition of the metal, but the values given in the accompanying table will be found useful for many purposes:

SPECIFIC RESISTANCE OF METALS.

Mercury.....	0.000 094073 ohm.
Silver (hard drawn).....	0.000 001652 "
Silver (annealed).....	0.000 001521 "
Copper (hard drawn).....	0.000 001622 "
Copper (annealed).....	0.000 001590 "
Gold (hard drawn).....	0.000 002118 "
Gold (pure and soft).....	0.000 001952 "
Aluminum (hard drawn).....	0.000 003160 "
Aluminum (annealed).....	0.000 002946 "
Zinc (pressed).....	0.000 005690 "
Platinum (pure annealed).....	0.000 008222 "
Iron.....	0.000 010200 "
Nickel (specially pure).....	0.000 006935 "
Lead (pressed).....	0.000 019850 "
Manganin.....	0.000 041000 "
German silver.....	0.000 020500 "

In practice, mercury columns are not used as standards of resistance, because they are not convenient to manipulate. The mercury column is selected in defining the "ohm" for general purposes, because it is easy to obtain mercury in a satisfactory state of purity, and also because all uncertainties relating to internal stress and physical state are eliminated by the use of a fluid standard. An isolated observer, for example, who wishes to construct a resistance of one ohm for experimental pur-

poses, can do so readily enough by preparing a column of pure mercury of known length and cross-section. He can then compute the resistance of this column, at the freezing point of water, and in this way he can obtain a standard of considerable accuracy. In practical work, however, it is customary to employ, as standards of resistance, coils of wire that are wound upon spools or bobbins. These are standardized either by comparison with other coils whose resistance are known, or by direct comparison with a mercury column of known dimensions and assured purity. A bobbin that is wound with wire as an ordinary spool is wound with thread possesses a considerable coefficient of self-induction if the length of wire is at all great; and this tends to impair its efficiency as a standard, because in the practical measurement of resistance it is desirable to have the self-induction of the standard as small as possible. Standard resistance coils are, therefore, wound in a special way, with the idea of reducing the self-induction as much as possible. One-half of the wire is wound about the central core (or spool) in one direction, and the other half is wound in the opposite direction so that if an iron core were placed in the axis of the spool, and a current were sent through coil, the magnetic effect upon the central iron core would be zero. By winding the wire in this way, the self-induction of the coil may be rendered negligible.

The resistance of a conductor varies with temperature and, although the magnitude of the variation differs with different metals, and even with the physical state of any one metal, it may be taken, roughly, as increasing by about 0.21 of 1 per cent, for each Fahrenheit degree of rise of temperature, for copper and silver and several of the other pure metals. The resistance of liquid mercury increases much more slowly with temperature, the coefficient of mercury being only about one-fifth of that stated above. The resistance of carbon diminishes as the temperature rises. In accurate electrical work it is evidently essential, in view of the variation of resistance with temperature, either to keep the temperature of the standard coils constant, or to ascertain the coefficient of variation of resistance with temperature with considerable care, so that a suitable correction may be applied for any departure of the temperature of the standard coils from the one temperature at which their resistances are accurately known. In practice it is usual to determine the temperature coefficient with as much accuracy as possible, and then to keep the temperature of the coil as near as practicable to the temperature at which it has been standardized. Any error in the determination of the temperature coefficient will then have but small effect upon the calculated resistance of the standard. Many attempts have been made to prepare alloys which shall have negligible temperature coefficient; and while no alloy has been found whose electrical resistance is absolutely independent of the temperature, several have been prepared whose temperature coefficients are quite small. German silver is one of the commonest of these alloys, the composition of that which is used in the preparation of resistance wire being (by weight) four parts of copper, two of nickel and one of zinc. The specific resistance of this alloy is

about 13 times that of copper, and its temperature coefficient is only about 0.022 of 1 per cent, per degree Fahrenheit. "Platinum-silver," as used for electrical resistance standards, is composed of two parts (by weight) of platinum to one part of silver. It has a specific resistance about 15 times as great as that of copper, and its temperature coefficient per Fahrenheit degree, is only about 0.017 of 1 per cent. "Manganin" has largely come into favor for electrical resistance standards in recent years, the composition recommended by the Reichsanstalt being (by weight) 84 per cent of copper, 12 per cent of manganese and 4 per cent of nickel. Its specific resistance is about 20 times that of copper, and its temperature coefficient is only about 0.0013 of 1 per cent per Fahrenheit degree, at ordinary temperatures; the coefficient diminishing as the temperature rises, until, at about 113° F., the coefficient becomes rigorously zero. At still higher temperatures, the coefficient of manganin becomes negative; but at all temperatures it is so small that it can be neglected for all purposes save those in which the highest attainable degree of accuracy is required.

In the preceding paragraph it was tacitly assumed that the temperature was not widely different from that prevailing in rooms in which electrical measurements are usually made. Kamerlingh Onnes has shown, however, that the relation between resistance and temperature undergoes a remarkable change in the vicinity of the absolute zero. Experimenting, for example, with a coil consisting of 1,000 turns of fine lead wire, the two ends of which he had fused together, he found that, although the coil had a resistance of 734 ohms at the temperature of the laboratory, its resistance appeared to totally vanish at 6° C. on the absolute scale. The coil was surrounded with liquid helium, and thereby cooled to 4.26° C. (absolute),—which is the boiling point of helium under atmospheric pressure,—and an electric current was then produced in it, by induction. At the temperature of the laboratory this current would die out to practically nothing within an extremely small fraction of a second after the removal of the exciting cause; but at the temperature of boiling helium the current persisted for many hours. It fell off, in fact, at the rate of less than 1 per cent per hour. If, however, the coil were lifted out of the helium, the current ceased abruptly as soon as the temperature rose to 6° C. (absolute),—this being the "vanishing point" of the resistance of lead, above which the energy of the current was quickly dissipated in the form of heat, in the usual way. In another experiment Onnes used a wire of solid mercury, the resistance of which, just below the freezing point of mercury, was about 50 ohms. As the temperature of this wire was lowered, the resistance diminished regularly until it became reduced to 0.12 ohm at 4.3° C. (absolute). Upon further cooling the resistance fell off abruptly at about 4.19° C. (absolute), to 0.00001 ohm; and at 2.5° C. (absolute) the resistance of the mercury was only one ten-thousand-millionth of the resistance observed at the freezing point of water. At 1.7° C. (absolute) a mercury wire will conduct a current having a density of 1,000 am-

peres per square millimeter, without showing any measurable difference of potential, and without developing heat. Ohm's law no longer holds, and the applied electromotive force may have to be increased a thousand fold, in order to realize a 10 per cent increase in the current. When a metal exhibits these singular properties, by reason of being cooled to a temperature lower than that at which its resistance practically vanishes, it is said to be a "superconductor." In the *Chemisch Weekblad* (Amsterdam), Vol. XVI, p. 640, C. A. Crommelin gives a historical and theoretical discussion of the work of Kamerlingh Onnes along these lines, and appends a valuable bibliography bringing the subject up to 1919.

In the accurate measurement of electrical resistance, the device known as "Wheatstone's bridge" is employed. Ohm's law, which is one of the most fundamental principles in the science of electricity, states that in any circuit of constant form, in which a constant electromotive force is acting and a uniform current is flowing, the current, resistance and electromotive force are connected by simple mathematical relation, which may be expressed in the following manner: Let any two points in the circuit be selected, and let R be the resistance included between these points, as expressed in ohms. Let E be the electromotive force between these same points, as expressed in volts; and let C be the current between them, in amperes. Then

the relation in question is $C = \frac{E}{R}$, or $E = CR$

To apply this principle to the measurement of resistances, let A and B , in Fig. 2, be the two

FIG. 2.

points selected, and let the circuit be divided at these points, into the two branches AH and AKB ; the resistance of AH being P while that of HB is Q , that of AK is S and that of KB is T . The points H and K are to be connected, later, by means of a conductor HGK , carrying a galvanometer, G ; but for the moment the conductor HGK is assumed to be non-existent. Let us suppose that the difference in electromotive force between A and B is E while that between A and H is e . Then Ohm's law, when applied to the branch AHB as whole, gives $E = C_1 (P + Q)$; C_1 being the current flowing through the branch AHB . Similarly, when applied to the section extending simply from A to H , Ohm's law gives $e = C_2 P$. Eliminating C_1 from these two equations, we find that e , the electromotive force between the two points A and H , is equal to $EP / (P + Q)$. In the same way we may show that the difference of electromotive force between A and B in the branch AKB is equal to $ES / (S + T)$.

If the electromotive force between H and K is zero, then these two expressions are equal, and we have $P/(P+Q) = S/(S+T)$, which is equivalent to $Q/P = T/S$, or to $PT = QS$. If H and K are connected by a branch conductor that includes a delicate galvanometer, G , then the galvanometer will indicate a current except when the electromotive force between H and K is zero; that is, it will show a current whenever the relation $PT = QS$ is not fulfilled. This arrangement of branch circuits, with a galvanometer bridging across from one of the branches to the other, constitutes "Wheatstone's bridge." Its use for measuring resistances may be illustrated as follows: Let Q and T be two known resistances, and let P be the unknown resistance, whose value is to be determined. At S we introduce a "resistance box," which is merely a box containing an assortment of known resistances, so arranged that any or all of them can be conveniently thrown into the circuit or out of it. The resistance S is varied by trial until the galvanometer G ceases to show a deflection; and when this condition is fulfilled, we know that the equation $PT = QS$ holds true. But we knew Q and T to start with, and we have determined S by trial; so that we know three of the four resistances that enter the foregoing equation, and we can, therefore, calculate the fourth. Resistances may be determined, in this manner, with exceeding accuracy. Consult for full details W. A. Price, 'Treatise on the Measurement of Electrical Resistance.'

Ohm's law enables us to foresee, very easily, how the cells of a given battery must be arranged, in order to obtain the greatest possible current through a given, fixed conductor by which its terminals are to be joined. If the zinc electrode of each cell is joined to the carbon electrode of the next one, so that the current has to pass through all the cells in succession, the battery is said to be arranged "in series."

The quantity of energy dissipated in the form of heat when a current traverses a conducting circuit was investigated by Joule, and also by Lenz, Becquerel and others. It is found that the quantity of heat-energy set free in any given conductor in one second is proportional (1) to the resistance of the conductor, and (2) to the square of the current that is flowing. If the resistance of the conductor is R ohms, and the current is C amperes, then the quantity of heat generated in T seconds will be $0.238 CRT$ calories; the "calorie" being defined as the quantity of heat required to raise the temperature of one gramme of water from 14° C. to 15° C. This is "Joule's law."

ALLAN D. RISTEEN, PH.D.

RESOLUTION ISLAND, the name of several islands, the principal one being in British North America, at the extreme end of Hudson Strait; lat. $61^{\circ} 39' N.$; long. $65^{\circ} W.$ The island is about 40 miles in length and breadth, and Cape Resolution is on the east side. Resolution Island, in Dangerous Archipelago, Pacific Ocean, is in lat. $17^{\circ} 22' S.$, long. $141^{\circ} 35' W.$ Resolution, a lagoon island in Low Archipelago, is in lat. $17^{\circ} 25' S.$, long. $143^{\circ} 24' W.$

RESOLUTIONERS, a designation of party which had its origin in Scotch Church history. When the Scotch with their covenanted

king, Charles Stuart (Charles II), had been defeated by Cromwell at Dunbar (13 Sept. 1650), the Scotch Parliament repealed an act under which royalists were excluded from the army. The repealing act was approved by a large majority of the Scotch Kirk as being wise and politic in the circumstances, but it was reprobated by a small but zealous minority in the kirk as a betrayal of the true interests of religion; this party was known as that of the Protestors, the other party as that of the Resolutioners; each of the two maintained that it was itself the genuine Scotch Kirk, the only church that remained faithful to the Covenant and to the Church's head, Christ.

RESOLUTIONS OF '98, the designation commonly given to the Kentucky and Virginia resolutions of 1798, defining the relations between the State and Federal governments, and protesting against certain acts of Congress as unconstitutional, and as violating the rights reserved to the States. The Resolutions offered in the Kentucky legislature, and adopted by that body, were drafted by Thomas Jefferson, who, in common with other leading American statesmen, and the majority of the people, was alarmed by the enactment of the Alien and Sedition Laws, and other measures regarded as indicating a purpose to create a centralized despotism in place of the Union formed under the Constitution.

The first Resolution declared that the Federal Constitution was a compact between the States, by which a general government was created for special purposes, and that, "as in other cases of compact between the parties having no common judge, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress." The Alien and Sedition and other laws were pronounced "not law, but altogether void and of no force," and one of the Resolutions postponed to "a time of greater tranquillity" the "revisal and correction" of other acts of Congress alleged to be unconstitutional.

The eighth Resolution directed the appointment of a committee of correspondence, to communicate the Resolutions to the several States, and to inform them that the State of Kentucky was determined "to submit to undelimited and consequently unlimited powers in no man or body of men on earth; that in the case of an abuse of the delegated powers, the members of the general government being chosen by the people, a change by the people would be the constitutional remedy; but when powers are assumed which have not been delegated, a nullification of the act is the right remedy; and that every State has a natural right, in cases not within the compact, to nullify of their own authority all assumptions of power by others within their limits." The Committee of Correspondence was instructed to request the other States "to concur in declaring those acts void and of no force, and each to take measures of his own for providing that neither these acts, nor any other of the general government, not plainly and intentionally authorized by the Constitution, shall be exercised within their respective territories."

The Resolutions passed the Kentucky legislature, 14 Nov. 1798, with only two or three dissenting votes, and similar Resolutions, drafted

by James Madison, were adopted by the Virginia legislature, 24 Dec. 1798, by a vote of 100 to 63 in the house of delegates, and 14 to 3 in the senate. The fact that both Jefferson and Madison were afterward elected Presidents of the United States, and that the Democratic party, which they represented, remained in power for many years, has been accepted as indicating that the Kentucky and Virginia Resolutions had the substantial approval of the American people. See UNITED STATES.

RESONANCE, the reduplication or echoing of sound, increasing its volume so that it may be regarded as strengthened. When a person speaks in an empty room the walls reflect the vibration. There is an echo from each wall, but it returns so quickly that we do not recognize it as an echo; and whether or not the listener is equidistant from the different reflecting surfaces, the echoes give the effect of strengthening the sound or increasing its volume. This resonance occurs when a sounding-board is used to strengthen the vibration from a string or a tuning-fork. Resonance is also observed when a sound is made in a large open-mouthed vessel. The form of the bell is designed to gain the benefit of this resonance. A piece of flat metal, the size of a bell, would not produce nearly the same effect, when struck by a hammer, as does the bell, whose sides reflect the vibrations. The principal of resonance applies to all waves, and is observed in electrical phenomena and radiography.

RESORCINOL, RESORCIN, 1:3 dihydroxy benzene, $C_6H_4(OH)_2$, is formed by the fusion of certain resins or gums with caustic alkalis. Aromatic compounds containing two side chains, e.g., benzene chlorosulphonic acids, benzene disulphonic acids and halogen phenols, will also yield resorcin when fused with caustic alkalis. On a commercial scale resorcin is prepared by gradually heating a mixture of dry meta sodium benzene disulphonate and caustic soda. The mass is stirred during fusion, and the temperature is not allowed to go above $275^\circ C$. The product is treated with much water, acidified with hydrochloric acid, extracted with ether or benzene and finally purified by distillation and recrystallization from benzene.

Resorcin is a colorless, crystalline compound, with a melting point of $118^\circ C$., and a boiling point of $276.5^\circ C$. It is somewhat volatile with steam and dissolves readily in water, alcohol, ether and glycerine. Its aqueous solution reacts with bromine water to give a precipitate of tribromoresorcin. On exposure to light and air it acquires a brown tint, due probably to the presence of moisture and traces of iron.

Resorcin is extensively employed in the manufacture of synthetic dyes. Heated with phthalic anhydride and a dehydrating agent it condenses into fluorescein, and from the latter may be obtained eosine, erythrosine, spirit eosine, eosine S, eosine BN, erythrosine G, spirit cyansosine, rose bengal, oriental yellow, etc. With phthalic anhydride, in the presence of benzyl chloride and sulphuric acid, resorcin condenses into chrysoline—the important silk dye. With diazoxylene and diazosulphanilic acid it forms resorcin brown. Resorcin is also employed for the preparation of tropaeoline O, isodiphenyl black, lacmoid, Hessian brown BB,

Kongo brown G, fast green O, Iris blue, Sudan G, etc.

On account of its antiseptic properties resorcin in water solution has been recommended as a wash for diseased stomachs, in the treatment of skin diseases, in hay fever, nasal catarrh, chronic eczema and intestinal catarrh; but recent experimenters claim that the employment of resorcin in large doses will usually develop symptoms similar to those of alcoholic poisoning.

Lehigh University

RESPIRATION. The essential process in respiration is the taking in of oxygen and the giving out of carbon dioxide by the living cells of a plant or animal. In higher animals special organs, the lungs (q.v.), and a special tissue, the blood (q.v.), are the main factors in this exchange; but in the lower animals various types of structures are utilized. Thus in insects there are series of ramifying tubes into which the air circulates; in water animals there are gills, which are the precursors of lungs in land animals. Even those higher animals in which the major part of the oxygen exchange takes place in the lungs (external respiration), there is also an internal respiration constantly taking place in the exchange between the blood, the lymph and other tissues. Respiration in plants is of the same general character as in animals. It is not to be confounded with the much more active process of photosynthesis by which plants utilize carbon dioxide and give off oxygen, a process which was termed respiration by the older plant physiologists.

Historical Summary.—The earliest naturalists and philosophers, Aristotle and others, even down to the anatomists of the 15th century taught that the function of respiration was to draw air into the arteries and heart, and thus to cool the blood. The old Galenic doctrine was that the "air introduced by breathing served to regulate, to maintain and at the same time to temper, to refrigerate the innate heat of the heart." Again the pumping action of the thorax introduced into the blood the air which was necessary to generate the vital spirits in the left side of the heart, and finally the same pumping action got rid of the foul vapors, the product of the innate fire burning in the heart. Harvey was one of the first to show that the same channel probably did not serve to carry these two different currents. But the chemical problems involved were too intricate for Harvey, although it was chiefly through the work of a group of Englishmen of the 17th century that the unraveling of the mystery of respiration came about. Von Helmont had taught a theory of fermentations, and he had noted the difference in color in blood passing through the lung. Borelli approached the mechanical side of the problem and showed the truth regarding the mechanics of the chest, the bellows-like action of which took in by atmospheric pressure and expelled the air by the muscular relaxation and the elasticity of the chest-walls. Malpighi, in the meantime discovered, with the aid of his crude microscopes, the minute structure of the lung, and Borelli, as well as others (Hooker 1667; Croon and Boyle, 1666), working with the newly-discovered principle of the air-pump and vacuum, had learned that air was absolutely

essential to the life of the animal, and had advanced to the point that the particles of the air taken into the lungs enter into and become mixed with the blood. But Borelli was a physicist, and had no sympathy with the new chemical learning, which was then a very vague subject. Hooks and Lower made the next steps possible, the former by his artificial-respiration experiments, proving the necessity for air, and the latter by his careful transfusion experiments, demonstrating that the difference between dark venous blood and lighter arterial blood was due to the admixture of air, thus explaining this color change, which had been recorded for thousands of years and referred to thousands of causes. Up to this time it had always been thought that the air was a simple substance, and not a mixture. John Mayow (1643) first showed that not all of the air was used by the lungs in influencing the blood, but only a certain part; and although he called it by a different name (*spiritus nitro-aerius*), it was that part now known as oxygen. Mayow thus developed the first full adequate physico-chemical theory of respiration. He saw that respiration was a process analogous to combustion, and that the movements were to take in the nitro-aerial gas and give out the vapors arising from the blood. But he did not know at all what these vapors were. He had grasped at the meaning of the intake, but had no knowledge of the exchange products. He said: "In the first place then, I take it for granted that the air contains certain particles termed by us elsewhere nitro-aerial which are absolutely indispensable for the production of fire, and that these in the burning of flame are drawn from the air and removed, so that the latter when deprived of these particles ceases to be fit for supporting fire." "With respect, then, to the use of respiration, it may be affirmed that an aerial something, whatever it may be, essential to life passes into the mass of the blood. And thus air driven out of the lungs, these vital particles having been drained from it, is no longer fit for breathing again." This and other wonderful discoveries were made by a young man of 25, and who died at the age of 34. Mayow's work was then forgotten for almost 100 years. As Foster expresses it, "that which in the first years of the latter half of the 17th century as igneo-aerial particles shone out in a flash and then died away again into darkness, in the last years of the 18th century, as oxygen, lit a light which has burned, and which has lighted the world with increasing steadiness up to the present day." The names of Stahl, Haller, Boerhaave appear as keeping alive the study of respiration. Stephen Hales, an active parish priest, and the earliest sanitarian, was an ardent student of chemistry. He first enunciated the principle of free and combined gases, and led the way to the work of Joseph Black, who rediscovered Von Helmont's "fixed air," which was given off by the lungs, and that animals placed in the "fixed air" died much as if they were deprived of fresh air. The next step was made by Priestley, who in 1772 rediscovered Mayow's "igneo-aerial" spirit and isolated oxygen. Priestley's views, however, were permeated by the century-old phlogiston theory, and it remained for Lavoisier clearly to demonstrate what oxygen really was and to overthrow the

phlogiston theory. Thus the problem of animal respiration was solved. The air, composed mostly of innocuous nitrogen and of small proportions of active oxygen, passes into fine air vesicles, first seen by Malpighi, the blood there takes up the free oxygen, giving off carbon dioxide, which exchange constitutes the essential feature of respiration. It should be added that it was not until Gustavus Magnus (1837) proved the presence of the blood-gases in different proportions in the blood that the present theory of respiration assumed a definite form. The study of the relation of the iron of the hæmoglobin in the blood to this oxygen exchange constitutes the last chapter in the unraveling of this secret of nature.

Mechanics of Respiration.—Breathing consists in the rhythmical expansion and contraction of the walls of the chest, by means of which process air passes into the lungs and thus comes in contact with the blood. The lung structure itself possesses no marked expansile power, but it is in a constant state of tension, there being negative pressure in the pleural cavity. The muscles attached to the ribs, including the diaphragm (q.v.), expand the cavity of the chest in all three diameters by raising the ribs and lowering the diaphragm; the air rushes in and inflates the lungs; the muscles then relax, the elasticity of the ribs causes the chest-wall to contract, the lungs themselves contract somewhat and the air is forced out through the bronchi and larynx. Thus it is evident that lungs themselves are merely passive agents in inspiration, being filled and emptied of air largely in consequence of the movement of the chest-wall. The control of the muscular movements is partly voluntary and partly involuntary, and the breathing centre so called is in reality a complex one, or rather a series of centres, all co-ordinated. Thus the motor centres for certain muscles attached to the ribs are located in the spinal cord, and their excitation can bring about restricted movements of expansion, while their destruction may result in paralysis of certain of the muscles of respiration. Another breathing centre, the most important one, spoken of as the automatic or true respiratory centre, is found in certain ganglion cells in the floor of the fourth ventricle of the medulla oblongata (q.v.). This is the vagus respiratory muscles. Their destruction destroys the co-ordination of the muscular movements and brings about death. A third centre is present in some portion of the fore brain, probably in the frontal lobes. It is the centre that enables one to "hold the breath," or to make extra deep breaths, etc. The distinction between conscious and unconscious breathing is very distinct and yet very subtle. Voluntary influences constantly modify the rate of breathing. While one is asleep these conscious influences are usually temporarily excluded, and then the so-called normal rhythm is seen. This is usually from 18 to 20 to the minute in the adult, the ratio of length of inspiration to that of expiration being about 10 to 12. Numerous individual variations may be present, however, the rate varying from infancy to old age, and in diseased conditions the rate is nearly always modified, usually quickened in consequence of the increased oxidation that often accompanies disease. Occasionally res-

piration is slowed when there is painful breathing, or some form of poisoning; opium-poisoning is a noted illustration. In this condition the breathing rhythm may sink as low as four to five to the minute. In children of both sexes the movements of breathing are similar, but as adult conditions develop, and changes in dress become pronounced, it happens that women are more apt to breathe more in the chest (costal breathing), while men make more use of the lower ribs and the diaphragm (diaphragmatic or abdominal breathing). The amount of air taken into the lungs varies widely with the size of the individual, the shape of his chest and a number of other factors that make it impossible to give a general average. It is usual to measure that portion of air that passes in and out of the lungs during normal respiration as tidal air; this has been known to be from 150 to 700 cubic centimeters. In forced breathing a certain extra amount of complementary air can be taken into the chest, its average being about 1,500 cubic centimeters. A certain amount of air (residual air) cannot be expelled from the chest even by forced expiration. This has been found to vary in amount from 400 to 1,500 cubic centimeters. The vital capacity, or the amount of air which can be expelled from the thorax by forced expiration following a deep inspiration—a spirometer, or the "lung-tester" of the circus, being the instrument for measuring the same—varies very widely according to practice, height, weight and age. For the comparative anatomy of respiration, see ANATOMY, COMPARATIVE, *Respiratory System*.

Artificial Respiration.—When death is imminent, owing to a cessation of the natural respiration movements, it may sometimes be averted by an imitation of them carried on regularly for a while. Such a condition may occur in disease (for example, asthma, epilepsy), though very rarely; it is most common in suffocation, either by drowning, choking or strangulation, and is sometimes met with also in poisoning by noxious vapors (for example, carbonic acid, carbonic oxide, coal-gas, chloroform, etc.). In order that any method may have a chance of being successful it is of course necessary that the entrance of air into the lungs be not impeded, whether by a piece of food or by water in the windpipe, or by the tongue falling back and closing the upper opening. A piece of food may sometimes be removed through the mouth by the finger; if this fails, the windpipe should be opened. In those apparently drowned the body should first be laid on the face, with the head low, and the thorax and abdomen be pressed on in order to expel fluids which may have been drawn into the trachea and bronchial tubes. The tongue may need to be held forward; this may be done by an assistant, or an elastic band passed round the tongue and the chin will effect the object. No general consensus of opinion has yet been arrived at as to which is the best method of producing artificial respiration. The methods most employed fall into three divisions: (1) insufflation, or blowing of air into the lungs, either by the mouth or by means of bellows; (2) manual methods, in which external manipulations of the chest-walls are made to effect the entrance and exit of air; (3) elec-

trical stimulation of the respiratory muscles. In all cases where artificial respiration is required every movement is of importance. It is doubtful whether life can ever be restored when the heart has ceased to beat for more than a few seconds; and when breathing has stopped failure of the heart's action is always imminent. That method is, therefore, best which can be applied with the least possible loss of time, so that under ordinary circumstances the methods which require bellows or electric batteries are out of the question. Direct insufflation, or blowing of air into the patient's lungs by the mouth applied to his mouth, is now hardly ever used except in the case of very young children, although within recent years specially devised pumps have been made that are at times very serviceable. Of the manual methods those most in use are Marshall Hall's (1856), Silvester's (1857) and Howard's (1877). The second is certainly the most easy to learn, but is more fatiguing to carry out for a length of time than either of the others. In Marshall Hall's method the body is laid upon its face and rolled "in what may be termed cradle-fashion" from this position on to one side and a little beyond it (inspiration), and then back on to the face (expiration). In Silvester's method the patient is laid on his back on a plane, inclined a little from the feet upward, and the shoulders are gently raised by a firm cushion placed under them, which also throws the head back. The operator then grasps the patient's arms just above the elbows and raises them till they nearly meet above the head. This action imitates inspiration. The patient's arms are then turned down and firmly pressed for a moment against the sides of the chest. A deep expiration is thus imitated. In Howard's method the patient is laid on his back with a cushion below the middle. The operator kneels astride his hips, places his hands with fingers spread outward over the lower part of the chest-wall and alternately bends forward, throwing his weight on the chest to imitate expiration, and springs back to allow the elastic recoil of the chest-wall to imitate inspiration.

Whatever method be adopted, the movements must be gentle, regular and perseveringly carried out, at the rate of from 10 to 15 times in the minute; and when the faintest natural effort at respiration is observed they must at once be timed so as to reinforce and not to oppose it. In some cases life has been restored under artificial respiration when no respiratory movements have occurred for an hour or even several hours. In all cases, but especially in that of persons apparently drowned, artificial respiration should be conducted in a warm atmosphere, 90° F., or even more if possible, and should be supplemented by warmth applied to the body and by vigorous friction. In those apparently drowned recovery is very rare after complete immersion for as much as five minutes. If stunning or fainting has occurred at the moment of immersion, so that the respiratory movements have been annulled or much diminished for the time, less water will have entered the lungs, and the chance of recovery may be greater. In other modes of death by suffocation, such as choking or strangulation, the action of the heart may continue longer, and

restoration to life be, therefore, possible after a longer deprivation of air. In recent years a variety of instruments, pulmometers, have been constructed to do the work of artificial respiration. These are widely used in industrial asphyxiation from fires, etc. See ANATOMY; ASPHYXIA; DROWNING; HEMOGLOBIN; LUNGS.

SMITH ELY JELLIFFE,

Editor 'Journal of Nervous and Mental Disease.'

RESPIRATION CALORIMETER. See CALORIMETER, RESPIRATION.

RESPIRATION IN PLANTS. See PLANTS, RESPIRATION IN.

RESPIRATOR, a contrivance used as a mouth-covering to protect the wearers from noxious vapors, coal-dust, mine-gas, etc. They are also frequently employed to secure the inhalation of a medicated atmosphere, containing a layer of lint or wool on which a few drops of terebene, eucalyptol or other antiseptic are placed.

RESPONDENT, (1) *in equity*, one who answers a bill. In this sense it is equivalent to the term defendant as used at common law. (2) *In admiralty*, one who answers a libel. (3) One who opposes an appeal; an appellee. (4) *In English law*, one who defends a suit for divorce. (5) *In civil law*, one who acts as security for another.

REST-CURE, a method of treatment advocated by Dr. W. S. Weir Mitchell in 1875 for cases of nervous prostration and various conditions characterized by poor blood and lack of muscular and nervous tone. It is a systematic treatment extending over several weeks, a combination of absolute rest of body and mind, regular diet at fixed hours, a separation from relatives and friends, passive exercise by massage, the use of electricity and the supervision of a trained nurse. The use of medicines is of secondary importance, but frequently of value. As Dr. Mitchell puts it, the rest-cure is of service to "invalids, unable to attend to the duties of life, and sources alike of discomfort to themselves and anxiety to others." Many modifications have been introduced in the system to adapt it to sufferers from alcoholism, indigestion, tuberculosis, etc. Consult Mitchell, S. Weir, 'Fat and Blood' (new ed., Philadelphia 1905); Dercum, F. X., 'The Rest Cure' (in 'Modern Treatment,' Philadelphia 1910).

RESTIF DE LA BRETONNE, Nicolas Edmé, French novelist and reformer: b. Sacy, 1734; d. 1806. Bretonne, though unknown to the general public, holds a remarkable place in French literature. The son of a farmer, he was educated by the Jansenists, and on their expulsion from France became a printer, and later went to Paris. He married Agnes Le Buges. Six or seven years after his marriage he began to write, and until his death poured out a stream of books, amounting in all to about 200. They were upon almost every kind of subject, and many were written in the wildest vein of license, both of speech and morals. Many of his books he printed himself and to-day the

original editions are very rare. It is impossible to mention his works in detail, because of the fact that they are so numerous and also because of the subject matter. Perhaps the best known of his novels is 'Le paysan pervers' (1777), a novel that had back of it a moral purpose, though written in a very immoral manner. Bretonne's 'Les Contemporaines' (42 vols., 1780-85) is a great collection of short stories, dealing with marriage, love and intrigue. 'La pornographie' (1769) was a plan to regulate prostitution, and the plan was tried in one of the German cities of the time. Perhaps the most important of his works was his remarkable autobiography, 'Monsieur Nicolas,' published in 16 volumes. This extraordinary work, which is one of the strangest pieces of literature in the world, presented his life story and his views upon society, morals and also his numerous love episodes. It ranks but little below 'Cassanova,' to which it is often compared. In 1795 Bretonne received a pension of 2,000 francs from the French government, and just before his death he was given a place in the Ministry of Police, which he did not live to fill. His other works are all filled with the same frankness of expression. Among them might be mentioned 'Anti Justine'; 'Filles du Palais Royal'; 'Le nouvel Abailard'; 'Le pied de Fanchette.' Though for some time Bretonne was considered simply as a pornographic writer, and was nick-named the "Rousseau du ruisseau — Rousseau of the gutter," to-day his works are considered valuable studies of the life of his time. It should be understood that Bretonne, though the author of many books, has not been translated in English, and there seems to be no reason for thinking that any of his works ever will be. There are numerous editions of his most important novels in French, and 'Monsieur Nicolas' has been translated into Italian and German. Consult Duhren, Eugene, 'Restif De la Bretonne' (Berlin 1906); Monsilet, C., 'Restif De la Bretonne' (Paris 1853). The best edition of 'Monsieur Nicolas,' Bretonne's leading work, is that published by Liseux (14 vols., Paris 1883-84).

RESTIGOUCHE, rès-ti-goosh', a river of Canada, in its lower course separating New Brunswick from the province of Quebec, and flowing northeast into the Bay of Chaleur at Dalhousie. It rises in eastern Quebec, is 225 miles long, is navigable for 16 miles to Campbellton and forms a tidal estuary for 24 miles. It drains 6,000 square miles and its basin supplies great quantities of timber.

RESTITUTIONISTS, a Christian religious sect in New England whose distinguishing tenet is that the restoration of mankind to the condition from which he lapsed through Adam's sin of disobedience is near at hand, and that the reign of perfect love, justice, purity and holiness is soon to commence. They observe the Sabbath of the Hebrews as a holy day of rest and assemble weekly for worship on the evening (Friday) before the Sabbath.

RESTORATION, in matters of fine art, the putting of a building, a work of sculpture, a painting or other work of art into what is thought to have been its original perfect condition. There is, however, a secondary meaning which is often used in a way to cause con-

fusion: this is the preparation of drawings showing what, in the opinion of the draftsman or his director, would be the appearance of the building or other work of art if restored according to the above definition. The term "conjectural restoration" is applied to these drawings, though all restoration is more or less conjectural, but the adjective is used in these cases because the drawings often represent much more complete and precise, and much less thoroughly verified statements concerning the original state of the work of art than those which are actually carried out.

To treat first of these suggestions for restoration embodied in drawings: Among the most useful in the way of architecture are some by Sibill, who continued the work of Letarouilly in his folio work on the Vatican in Rome, and those by the well-known author and architect, Viollet-le-Duc, especially in the plates to 'Entretiens sur l'Architecture,' and in three or four large lithographs for display on the walls of schools and the like. These are based upon a very exact knowledge of the processes of building. There are some of singular interest in the work on the discoveries at Pergamon, by Pontremoli and Collignon ('Pergame,' Paris 1900); in the kindred work on 'Epidaurus' by Defrasse and Lechat, Paris 1895; also in a three-volume book called 'La Restauration d'Olympie' by Laloux and Monceaux. In such drawings a building will be shown complete and in use, with figures near it and passing up and down its flights of steps, or seated on its stone benches. Life is given to the representation by landscapes fitted to the purpose, or by other carefully considered surroundings. In connection with these there should be mentioned also the models in plaster, the preparation of which is a serious art in Paris and in other great centres of artistic study. These models, when concerned with a non-existent building, may be a complete rendering of that building, as in the case of the model of the Parthenon and that of the Hypostyle Hall at Karnak, both at the Metropolitan Museum of Art, New York. (See ARCHITECTURE; EGYPTIAN ARCHITECTURE). In these there has been a bold attempt to show, as if definitely known, the entirely uncertain structure of the roof of the great temple, and also the painting on the same building, according to the theory of the accomplished architect who designed the model, the late Charles Chipiez: but the Egyptian temple has its paintings modified on account of modern notions of propriety. The model of the Pantheon at Rome, in the same collection, can be visited both within and without, and is more nearly trustworthy than that of the Parthenon. Of the same nature are the fine Scheck models of the temples of Solomon and of Herod (see JERUSALEM). All of this, however, is conjectural restoration of excellent quality.

Restoration of buildings, when carried out in reality, is extremely open to error of the most mischievous sort, because it is never safe to assume that the last word has been spoken in the matter of demonstration of the building's original condition. As the years advance, for instance in 1920, we could not for a moment accept the archaeological knowledge of our predecessors, say of 1860, and yet in the years following the middle of the 19th century nearly all the most important mediæval buildings of

Europe were restored, and too often in a radical way. In too many cases the original character of the building is destroyed altogether, as in the famous instance of the church of Saint Front at Périgueux, and in the case of the Fondaco dei Turchi at Venice, now the Museo Civico; but in a vastly greater number of cases the restoration has been conscientious and in a way judicious, but has still destroyed much that would be, had it been spared, the best possible evidence for the original study of the structure. It will be noted that the ambition of the official or committee in charge of a great building, religious or secular, is nearly always to have it as complete and elegant as may be; that this ambition is more than repeated in the architect whose reputation and pecuniary gain are closely connected with the great and costly undertaking; and finally that these ambitions find an echo in the opinions of the general public, who, of course, like to see the famous monument of their city put into first-rate order and kept as clean and perfect and bright-colored as the new buildings near. To this is added the actual demand for safety. Thus, in the case of the Ducal Palace at Venice, of which the restorations were carried on between 1881 and 1884, a conscientious desire to preserve the famous building intact was present in the mind of the controlling intelligence; but the great capitals of the lowermost arcade upon which the whole weight of wall reposes were in many cases found to be so split that they were unsafe. It may well have been thought with perfect honesty that the preservation of the building required their removal; they were removed and placed with all care in a hall of the building, while newly cut capitals were put in their place. Saint Mark's was more harshly treated, for the exquisite marbles with which the exterior was sheathed were carried off and replaced by slabs of a vastly inferior quality and color, a certain smoothness and a certain appearance of finish being thus obtained at the expense of the chromatic beauty of the original work. Nothing need be said of the mosaics, because they are always in a state of change, repairs and restorations going on all the time: but the change in the great floor of the church by which the singular waves and hollows which had marked it for so many years were all graded and the floor smoothed out into a glossy, modern pavement, excited at the time the greatest indignation on the part of many, but can hardly call for criticism, there being so much doubt as to the true cause of the old inequalities.

There is still another difficulty in the restoration of buildings, namely, the introduction of later, though still early, details. Thus in a Gothic cathedral, especially in England, one whole bay of the north or south aisle will have been built up with 14th century windows, contrasting oddly with the "early English" fenestration of the neighboring bays. Shall the restorer respect these changes of an earlier time, or shall he sweep them all away and make the church that which, according to his best lights, it was in (say) 1195? It is evident that there is great room for disagreement as to this, and that no restoration of such building can ever satisfy the student altogether. It is evident that every precaution should be taken to save the old work and that the interests of fine

art and archaeology alike demand the preservation of every bit and scrap of building as it has reached us from antiquity, repairs being carried out only in so far as to save the ancient pile with all its details. At the same time excuses can readily be found for those who advocate a sweeping restoration: for, as they would say, the building was meant to be used and was meant to have a certain general aspect: is it not probable that we know enough to put it back to its original character? Unbelieving critics can never persuade these people of their own probable ignorance.

In sculpture the case is more simple. Until within the last 25 years an important antique statue was generally restored, and the most skilfully carried out restoration was perhaps that of the *Ægina* sculptures in the Glyptothek in Munich. These are said to have been directed by the celebrated sculptor Bertel Thorwaldsen, and they have a wonderful appearance of verity, while at the same time no one can say how far the surface of the marbles found in *Ægina* have been lowered in places to agree with the restoration. It has always been considered a wonderful piece of good fortune at a time too early for such intelligence in archaeological matters — the preservation from restorations of the *Venus of Milo* in the Louvre, this preservation having been largely the result of disagreement. On the other hand, the finds of the years since 1870 are much more commonly preserved intact; no one will think of restoring the *Hermes of Olympia*. Even in our own time, however, such slight injuries as the breaking of two or three fingers in the *Augustus of Otricoli* in the Vatican, or in the *Venus of the Capitol*, are pretty certain to be repaired, but then it is the custom of all properly managed museums that a label shall hang on the pedestal with a full description of the additions made, and the catalogues of the better organized museums contain also such a mention in full.

In the matter of painting it has long been understood that there is only one safe way and that is to refrain from bringing a brushful of paint anywhere near the canvas. The old picture has suffered certain injuries; it must not, therefore, be subjected to the greater injury of falsification. As late as 1885 paintings in several of the museums of Europe were undergoing repainting of the most radical sort. Any person who was looking into the matter at that time would miss from its place in a church or gallery some great canvas. If he were shrewd and bold he would get sight of that canvas set up against a wall on its side or on its head perhaps, and there undergoing a process of repainting in sky or drapery at the hands of the most unintelligent operative who could use a palette and a painter's pencil. By and by the picture would be in its old place again and then the few who look closely into a picture would feel that their old friend and inspirer was gone. The director of just such a restoration said to the writer that he was quite aware of the opinion of the foreign visitors that this ought not to be done — that only a patch of neutral color should be put in where an actual blister had existed — where color had left the canvas altogether — that, in short, the picture should be mended, but not repaired and renewed with an attempt to imitate its original surface. He was a good-tempered old gentle-

man and made no pretense at artistic pride in his work, which indeed was going on at the hands of the most forlorn and careless copyists, but it was his work, for which his salary was paid. It was suggested long ago that every picture in a public gallery should have hung on its frame an exact account of what had been done to it and when — whether partial repainting or repairing of positive injuries, revarnishing, transferring from wood to canvas or the like. This, however, has not been done as yet, and the student of the most precious paintings in the world is grievously handicapped by the primary difficulty of discovering what is really the artist's work and what is the ignorant tinkering of irresponsible moderns. Consult Holyoake, M. L., 'Restoration of Paintings' (in *Magazine of Art* London 1900); Secco-Suardo, 'I restauratore del dipinti' (Milan 1894).

RUSSELL STURGIS.

RESTORATION, The, in English history a term applied to the accession of King Charles II, in 1660, after the civil war, to the throne of England, after an interregnum of 11 years and 4 months, from 30 Jan. 1649 (when Charles I was beheaded) to 29 May 1660. In French history, the first restoration begins 3 May 1814, when Louis XVIII made his entry into Paris under the protection of foreign bayonets and ended with the return of Napoleon from Elba, 20 March 1815. The beginning of the second restoration is generally reckoned from the battle of Waterloo, 18 June 1815, and terminated on 29 July 1830, with the abdication of Charles X.

RESTORATIONISTS, the followers of Origen in the opinion that after a certain purgation proportionate to their delinquencies all will be restored to God's favor and to paradise. In the Middle Ages, the Brethren of the Free Spirit held this doctrine; at the time of the Reformation, it was taught by the Anabaptists and in the 18th century by the Rationalists. See also **UNIVERSALISM**.

RESTRAINT OF MARRIAGE, that which unreasonably represses or restricts marriage, as a clause in a will forbidding under penalty the marriage of an unmarried person. Such a condition, if general, is void. A condition in restraint of a second marriage is held to be legal. Likewise a condition which restrains marriage with a particular class is legal. It has been held that the limitation of a bequest or an annuity to continue until a woman shall marry is legal both in the United States and in Great Britain. Similarly a condition in restraint of marriage is legal if a condition precedent.

RESTRAINT OF TRADE, that which tends unreasonably to restrict or prevent trade. By common law a contract which deprives a person of the right freely to engage in lawful business is void as contrary to public policy. However, contracts which are in partial restraint of trade, for a valuable consideration and which are a reasonable protection to a contracting party are legal. For instance, an agreement by A with B never to carry on business again or not to carry it on for 100 years at any place would be void, but an agreement by A with B not to carry on a business in the same town with B for 10 years would be reasonable

and, therefore, valid. The tendency of the law in the United States and that of Great Britain are similar, but there are minor differences. Interstate and international commerce in the United States became subject to the provisions of the Sherman Act in 1890. In effect, this statute declares that old contracts, combinations, etc., in restraint of interstate or international commerce are void. It subjects to a penalty all persons found guilty of such acts and provides for forfeiture of goods in transportation in violation of the act by the government and dissolution of such contracts. Formerly it was held by the Supreme Court of the United States that all such restraints of trade, whether reasonable or unreasonable, violated the statute, but in later decisions this rule was modified by the adoption of the so-called "rule of reason," which practically follows the old decisions that no restraint is void which is reasonable. Various States have passed laws punishing restraint of trade, notably Kansas, Ohio, Missouri and Texas. It has been suggested, as an aid to Federal enforcement of laws punishing restraint of trade, that all industrial concerns doing an interstate business be compelled to incorporate under Federal laws, but this would probably require a constitutional amendment and is, therefore, impracticable.

RESTRÉPO, *ră-strá'pō*, **Carlos E.**, Colombian statesman: b. Medellín, 1868. He received an excellent education and engaged in the practice of law, taking an active interest in politics. He served in the House of Representatives, acting as its presiding officer, and in 1910 was elected President of the republic. At the time of his election to succeed Gen. González Valencia there was a strong anti-American feeling at Bogotá and an American-owned railroad was obliged to suspend service. In the following year the United States consul, W. B. MacMaster, died under suspicious circumstances. Restrepo, although originally anti-American, changed his policy and labored earnestly to bring about a better understanding between the two countries. His administration was notably prosperous.

RESTRÉPO, **José Manuel**, Colombian historian and statesman: b. Envigado, 1780; d. 1 April 1864. He early gained a literary reputation and in 1810 espoused the cause of independence. He was a member of the Congress of Cúcuta and became Foreign Secretary in the newly-established government. He was afterward intimately associated with Bolívar, serving for a time as his secretary. His history of the revolution is highly valuable, much of his information being secured through personal observation. It was published 'Historia de la revolución de Colombia' (1827).

RESUMPTION, the return to specie payment by a government. The Resumption Act of 14 Jan. 1875 fixed 1 Jan. 1879 as the day on which specie payments should be resumed by the United States government. Resumption actually took place on 17 Dec. 1878, when the premium on gold disappeared.

RESURRECTION, generally spoken of as *resurrection of the dead*, or of *the body* (*resurrectio mortuorum*, *resurrectio carnis*, ἀνάστασις τῶν νεκρῶν) is the doctrine of the

reunion of the soul and body of man after their separation in death. This teaching of revealed religion should be distinguished from that of the immortality of the soul, and the eternal survival of human personality after death. (See **IMMORTALITY**). Moreover, the miraculous resuscitation of the dead,—by the intercession of the prophets of the Old Law and the apostles of the New, or by the Divine power of Jesus Christ,—does not enter within the scope of the belief in a general resurrection. After summing up the traces of the resurrection-belief as they are found in paganism, this article will give the biblical, ecclesiastical and patristic evidence in favor of the revealed truth of a future resurrection; and will then establish the fundamental fact of Christianity, the resurrection of Christ.

I. Pagan Traces.—In pagan religions, degenerated from God's primitive revelation to the human race, there is a common and definite belief in the survival of human personality after death; but the traces of a hope of a future resurrection are not universal nor distinct. Many savage tribes witness to a crude belief in metempsychosis. Such theories of reincarnation and transmigration of souls may readily be distortions of a primitive revelation of the resurrection of the body. The totemistic worship of the bear, the beaver, etc., which is found among the Sioux, Iroquois and other American Indians, follows upon the idea that the souls of the tribal ancestors have been reincarnated in those animals. Among the Egyptians, reincarnation was a purification of the soul and a preparation for final and separate existence. Consult Budge, 'The Egyptian Heaven and Hell' (1905); 'The Book of the Opening of the Mouth' (1900); 'The Liturgy of Funerary Offerings' (1909); 'The Book of the Dead'; Garstang, 'Burial Customs of Ancient Egypt' (1907). To the Babylonians the idea of resurrection is familiar. It is supposed in the worship of Tammuz. Consult *Hymn to Tammuz* (in Rogers, 'Cuneiform Parallels to the Old Testament,' 1912, p. 179). In the 'Descent of Ishtar,' Tammuz and Ishtar return alive from the abode of the dead. (Dhorme, 'Choix de textes religieux Assyro-Babyloniens' 1907, p. 326; Lenormant, 'Mélanges d'archéologie égyptienne et assyrienne,' Vol. I, pp. 31-35). Marduk and other gods are accredited with the power to raise men from the dead (Jeremias, 'Babylonisch-Assyrischen Vorstellungen vom Leben nach dem Tode,' 1889, p. 100). In the henotheism of Marduk he is invoked as 'he that giveth life to the dead' (Jensen, 'Die Kosmologie der Babylonier,' 1890, p. 196; Martin, 'Textes religieux assyriens et babyloniens,' 1903, p. 217; Lagrange, 'Études sur les religions sémitiques' 1905, p. 340). Persian religion has its resurrection of the dead; but the Avesta, containing this doctrine, was not closed until the 3d century of the Christian era. (Lagrange, 'La religion des Perses,' 1904, pp. 33-35). In India the idea of metempsychosis is essential to religious thought. Each Buddhistic *Karma*, or successive life, depends upon the perfection of the soul's preceding incarnation; and this cycle of existences leads up to *Nirvana*, a cessation of conscious existence, or annihilation of personality by absorption in the Buddhistic Absolute. Mohammedanism borrows and de-

teriorates resurrection-ideas of Hebrew and Christian revelation.

II. Old Testament Teaching.—1. Genesis. The human race, at its creation, was endowed with the preternatural gift of immortality. At the dawn of human life, the separation of soul from body in death was precluded by God's special providence. The tree of life stood in the midst of Eden (Genesis ii, 9); and the eating of the fruit of that tree was somehow associated with the immortality of Adam's animated body. Jahweh intended to perpetuate this preternatural and deathless union of man's soul with his body, had Adam not sinned. But Adam sinned. He and the human race lost the preternatural gift of immortality. God had threatened: "Dying thou shalt die," if thou disobey (Genesis ii, 17 and iii, 3). After the disobedience, that threat was fulfilled: "Dust thou art, and unto dust shalt thou return" (Genesis iii, 19). "By one man the sin entered into the world; and by the sin entered death. And in this wise death passed unto all men, for as much as all sinned" (Romans v, 12). However, the final triumph over death is implied in the promised victory of the seed of the woman over the seed of the serpent (Genesis iii, 15).

2. Job.—It is not certain how this revelation of the triumph over death was evolved into a clear belief in the resurrection of the body. All at once we come upon that belief in its full evolution about the 10th century a.c. Our witness is the dramatic epic called the Book of Job. Without any prospect of human comfort, the patient sufferer looks forward to the unending joy of an eternal reunion of his soul and body. The Masoretic, Septuagint and Vulgate traditions of the text are slightly variant, though substantially the same. To the scepticism of Bildad and the Shuhite, Job makes reply:

I know that my Redeemer liveth:
And on the Last Day from the dust shall I rise.
Yea, again shall I be clothed with my skin;
And in my flesh shall I see God.
Him I shall see for myself.
Yea, mine eyes shall look on, not another's.
Full fraught is this hope in my bosom. (Job xix: 25-27)

3. Hosea.—During the dreadful times that preceded the Assyrian exile, Hosea, a prophet of the northern kingdom of Israel, about a.c. 750, foretold the triumph of the chosen people in terms that clearly refer to the resurrection, especially to that of the Messias:

Come, let us go back to Jahweh.
For He hath bruised, that He may heal us;
He hath smitten, that He may cure us.
After two days He will quicken us;
On the third day He will raise us up,
That we may live before His face. (Hosea vi, 1-2)

The triumph of Israel over death is a resurrection hope, bound up in the promise of national redemption that Jahweh makes through His prophet:

From the power of She'ol shall I free them;
From death shall I redeem them.
Where is thy sting, O death?
Where is thy doom, O She'ol? (Hosea xiii, 14)

This prophecy, Saint Paul tells the Corinthians (1, Cor. xv, 54-55), is to be fulfilled at the resurrection of the flesh.

4. Isaiah.—Shortly before the fall of Samaria a.c. 722, Isaiah, a prophet of the southern

kingdom of Judah, intermingled thoughts of the resurrection with his Messianic prophecies. By means of the Messianic triumph Jahweh of hosts "shall cast death down headlong for ever" (xxv, 8). In that day of complete redemption,

Thy dead shall come to life again;
My slain shall rise up again.
Awake and shout for joy,
Ye that dwell in the dust.
For thy dew is a dew of light;
Yea, the earth shall bring forth her dead.
The earth shall unveil her blood;
She shall cover her slain no more. (Is. xxvi, 19-21)

In the prophets of both the Assyrian and the Babylonian period the redemption of Israel from thralldom in Assyria, and of Judah from Babylonian bondage, is a type of the resurrection of the world from slavery to sin. The sacred manumission of the slave to sin, by means of the mediatorship of the Messias, is completed in the glorious resurrection of the body. That is why Isaiah now and then is inspired to shift his thought from the salvation of Israel or of Judah to that of the soul of man by reunion with its body in glory.

5. Ezechiel.—Coming to the Babylonian period of prophecy, we find Ezechiel (a.c. 592-586) foretelling the salvation of Judah in terms that vividly picture the resurrection. The prophet in vision stood in the midst of a vast plain "full of bones . . . and, lo, they were very dry." Then Jahweh prophesied to the bones:

Lo, within you I shall put spirit,
And ye shall live.
I shall grant you sinews,
I shall raise up for you flesh,
I shall set over you skin,
Within you I shall put spirit,
And ye shall live. (Ezech. xxxvii, 5, 6)

Straightway "there was a noise . . . and a rattling; and the bones moved nigh, each bone to its own bone." Lastly "came into them the spirit; and they lived, and they stood upon their feet. They were an army exceeding great" (xxxvii, 10). The belief in the resurrection must have been real and universal in Judah; else Ezechiel would not have received and set forth, in terms of that figure, the revelation of the ultimate triumph of his people.

6. Daniel.—Throughout the Babylonian Exile (a.c. 586-536) and thereafter, the prophet Daniel is a clear witness to that part of Jewish eschatology, which has to do with the fact of a future resurrection of the body. "At that time Michael, the great leader, who stands for the sons of thy folk, will rise up; and there will be a time of anguish, such as never has been since nation was even until then. At that time shall thy folk be saved,—all that are found to be written in the book. And the multitude of those that sleep in the dust of the ground shall awake,—some unto life eternal, others unto reproach and unto shame eternal. Yea, they that teach wisdom shall shine like the refulgence of the firmament; they that bring many to justice shall be like stars forever and beyond" (xii, 1-3).

7. The Psalms.—The Book of Psalms, in its present state, is likely the result of a series of inspired redactions, dating from the time of David (a.c. 1017-977) up to the time of the close of the canon of Esdras (a.c. 444). The

soul's longing for immortality is clear, and the resurrection-hope at least faintly glimmers throughout this long period of liturgical evolution of Israelitic hymnody. The Davidic Psalm 16 (15):9, 10 proclaims the immortality of the pious:

Therefore my heart is glad, and my tongue exults;
Surely my flesh now abides in hope.
For thou wilt not give over my soul to She'ol;
Nor suffer thy pious one to see corruption.

A later Psalm 49 (48):14-15, of the Psalter of the Sons of Korah, consigns the wicked to She'ol and redeems the just:

Like sheep to She'ol they are driven;
Death shepherds them;
The just shall rule over them in the morning;
Their beauty is for She'ol to waste out of its dwelling.
Surely God will save my soul from the power of She'ol;
For He will take me.

Asaph's Psalm 73(72):24, 25, yearns for immortality. David sings that his joy will be complete in the beatific vision of God, after his awaking from the sleep of death (Psalm 17:15).

8. Maccabees.—During the tortures they underwent, at command of Antiochus IV (b.c. 175-164), the Maccabees appealed to the hope of resurrection as their stay (2 Macc. vii, 9). The third of the seven sons put forth his tongue to be torn out, and hands to be lopped off; and said: "These I despise, for I hope to receive them back again from Him" (2 Macc. vii, 11). The fourth son taunted the king: "It is better to be put to death by men . . . so as to be raised up by God. To thee resurrection will not be unto life" (2 Macc. vii, 14). The author of 2 Maccabees narrates that Judas sent a large offering to Jerusalem, so as to have sacrifices offered in expiation for the sins of the slain; and adds: "In this he acted quite rightly and religiously, having in mind the resurrection. For had he not deemed that they, who had fallen, would rise again, it would have been useless and silly to pray for the dead" (2 Macc. xii, 43, 44).

9. Apocrypha.—Though not among the inspired and canonical books of the Bible, the apocrypha bear historical witness to the faith of the period that immediately preceded the foundation of Christianity. In 1 Enoch, Section II, *The Parables*, cc. 37-71, written b.c. 94-79, many details of the resurrection are enumerated. "The earth shall give back that which has been laid away in it; She'ol shall give back that which it has received" (li. 1). All mankind shall rise. The angels shall measure the secrets of all. Not one shall escape. "On the day of the Elect One, not one shall be destroyed before the Lord of Spirits, not one can be destroyed" (lxi, 5). 4 Ezra, 31-44, supposed to have been drawn from an *Ezra Apocalypse* written about a.c. 30, is ample and detailed in regard to the universal resurrection and last judgment. "The earth shall restore those that sleep in her; and the dust, those that rest therein." The Testaments of the Twelve Patriarchs, *Benjamin*, x, 7-10, written b.c. 137-107, teaches that all will rise, "some unto glory and some unto shame"; God will "convict Israel through the chosen ones of the Gentiles."

III. New Testament Teaching.—The time and details of the Parousia are treated elsewhere. (See *ESCHATOLOGY*). This article is

limited to the fact and manner of the resurrection. The current Jewish eschatological belief, at the beginning of the Christian era, is manifested by Martha in regard to her brother Lazarus: "I know that he will rise again at the resurrection on the last day" (John xi, 24).

1. Doctrine of Jesus.—Our Lord repeated the Old Testament teaching in this matter. The Sadducees "said there was no resurrection," and denied even the immortality of the soul (Josephus, *Antiquitates Judaicae* XVIII, i, 4). They proposed to Jesus the case of a woman, who by the Mosaic law of *go'el* had married seven brothers, one after the other. "At the resurrection, to whom of the seven will she be wife?" In reply, our Saviour blamed them because of ignorance of Scripture. "For at the resurrection there will be no marrying nor being married; but they will be as angels in heaven." The glorified body will not be subject to the appetites of the flesh. The Sadducees grossly caricature the glory of the resurrected body. Its joy is of God. "He is not a God of the dead, but of the living" (Matt. xxii, 23-32; Luke xx, 28-38). Besides, Jesus claimed that, as Son of Man, He would be the Judge of men (John v, 23-27). He added: "A time is coming and now is, when the dead shall hear the voice of the Son of God; and they that hear shall live. . . . A time is coming when all who are in their graves shall hear His voice. And they shall come forth—they that have done good, unto a resurrection of life; they that have done evil, unto a resurrection of condemnation" (John v, 28, 29). This resurrection unto life, Jesus promises, He Himself will accomplish in the case of those that believe in Him (John vi, 39, 40); follow the impulses of God's grace (John vi, 44); eat the flesh and drink the blood of the Son of Man (John vi, 45). He said to Martha "I am the resurrection and the life. He that believes in me shall live, though he die; yea, he shall never die, who lives and believes in me" (John xi, 25, 26). The charitable shall receive their "reward at the resurrection of the good" (Luke xiv, 14). The unjust also will rise from the dead to be punished for their sins (Matt. v, 29, 30; Mark, ix, 43-49); they will go soul and body to hell (Matt. x, 28). At the Parousia, the risen just will stand at the right, and the risen unjust at the left of the Judge. He will pronounce sentence of damnation of the latter to eternal fire, and of welcome of the former to everlasting bliss (Matt. xxv, 31-46).

2. Doctrine of Saint Paul.—In keeping with his teaching that the Church is the mystic Christ, whereof Jesus is the mystic Head and we are the members, Saint Paul links together two correlative doctrines. The first is that of the mystic resurrection of both Head and members, by the rising of the soul above things of sin. The second is the teaching that the physical resurrection of the Head postulates the rising of the members: "Now if it be preached that Christ rose from the dead, how is it some among you say there is no resurrection of the dead? Why, if there be no resurrection of the dead, not even Christ is risen. And if Christ is not risen, then vain is our preaching—yea, vain is your faith; and we are proven to have been false witnesses of God; forasmuch as we have testified of God that He raised the Christ, whom He did not raise—if, forsooth, the dead

do not rise" (1 Cor. xv, 12, 15). This denial of the resurrection is due to an infiltration into the Corinthian Church either of Sadducean ideas or of the Hellenism that scouted the doctrine upon the Hill of Ares in Athens (Acts xvii, 32). To show how fundamental is belief in the resurrection, Saint Paul urges the doctrine at Athens (Acts xvii, 18), at Jerusalem (Acts xxiii, 6), before Felix (Acts xxiv, 15), and Agrippa (Acts xxvi, 8). The Pauline letters again and again present the argument: Jesus, the Head of the mystic Christ is risen; therefore, we, the members of that mystic Christ, the Church, shall also rise from the dead (Romans viii, 11; 1 Cor. vi, 14; 2 Cor. iv, 14; 1 Thess. iv, 14; 2 Tim. ii, 11). Christ, "the first of those that sleep" the sleep of death, is the second Adam. As body and soul are separated in death because of the sin of the first Adam; so body and soul come together after death because of the merit of the second Adam (1 Cor. xv, 20-23). "He will transform the body of our lowliness, that it may be conformed with His Body of glory, by the same power that enabled Him to subject all things to himself" (Phil. iii, 21). If this be not true, then one may as well follow one's lower appetites, and act according to an Epicurean fundamental principle of life: "Let us eat and drink; for to-morrow we die" (1 Cor. xv, 32, citing Isaiah, xxii, 13).

3. Manner of the Resurrection.—Saint Paul preached "a resurrection of the just and the unjust alike" (Acts xxiv, 15). True, his letters generally have to do with the rising only of the just, who have died in the mystic union with Christ by grace. Yet He clearly means that both the just and the unjust will rise unto immortality in the same bodies as were animated by the soul before death. It would not be resurrection, were the dead to rise in bodies not their own. These identical bodies, in all their entirety, will be so transformed at the resurrection as to be immortal. The transformation of the living, at the Last Day, will be consequent upon the equivalent of death, a summary death that will be immediately followed by resurrection. The living will not then die the lasting death, which the Apostle calls sleep. "We shall not all sleep; but we shall all be transformed in a moment, in the twinkling of an eye, at the last trumpet-call. For the trumpet will sound, and the dead will rise immortal, and we also shall be transformed" (1 Cor. xv, 51, 52). As the grain of wheat differs from the blade that shoots up therefrom, so the earthly body differs from the transformed (1 Cor. 36, 37). To the just, this immortality of the transformed body will be an everlasting joy; to the unjust, a never ending torture. This torture is vividly described in Matt. v, 29, 30; xxv, 41-46; Mark, ix, 43-49; and Apoc. ix. In the last pericope, it is expressly stated that the tortures of the wicked are "not allowed to kill them." The tortured "will seek death, and will not find it; they will long to die, but death will flee from them" (Apoc. ix, 5, 6).

In what will the transformation of the bodies of the just consist? Saint Paul tells us, after putting himself the questions: "How shall the dead rise? With what sort of body shall they come forth?" (1 Cor. xv, 35-57). Four qualities of spirit will transform the risen

bodies of the just. The first of these qualities is *impassibility*, by which the glorified body is not subject to pain and is forever freed from those organic changes that end in death. "For this perishable body must put on an imperishable form: and this dying body must put on a deathless form" (verse 53). The second quality of the glorious risen body is *glory*, or brightness, by which the bodies of the saints are refulgent and dazzling in beauty, and "shine like the sun" (Matt. xiii, 43). "There are heavenly bodies and earthly bodies: but the glory of the heavenly bodies is not the glory of the earthly. The glory of the sun is not the glory of the moon, nor the glory of the stars: for star differs from star in glory. Even in such wise is the resurrection of the dead" (1 Cor. xv, 40, 41). The third quality of the bodies of the risen just is *agility*, by which the risen body is freed from the hindrance of gravity and speedily moves through space like as does a spirit. Saint Paul has this agility in mind, when he writes: "With a summons, with a voice of an archangel, with a trumpet-blast of God, the Lord Himself will come down from heaven. Then the dead in Christ shall rise first; and afterward we, if we be alive, if we be left over, shall with them be caught up into the clouds to meet the Lord in the air. And so we shall ever be with the Lord" (1 Thess. iv, 16-18). The fourth quality of the glorified body is *subtility*, by which it becomes spiritualized or like to a spirit, passes through material objects as did the glorified body of Christ and is under the absolute control of the soul. "Sown mortal, it rises immortal; sown tainted, it rises glorious; sown weak, it rises mighty; sown an animated body, it rises a spiritualized body. As surely as there is an animated body, so is there a spiritualized" (1 Cor. xv, 42-44).

IV. Ecclesiastical and Patristic Evidence.—The creeds of the Church, from the beginnings of Christianity, have contained the belief in the resurrection of the dead. Such are the Apostles' Creed, as witnessed to by Justin (A.D. 138-165), Tertullian (194-221), Phœbadius (d. c. 392), Rufinus (d. 410) and Epiphanius (d. 374); the *Fides Damasi* (c. 380), the Nicene-Constantinopolitan Creed (381), *Libellus in modum Symboli* (referred to by Gennadius c. 490), the *Quicumque* (fifth cent.) and later creeds. So, too, the Fathers bear overwhelming witness to the doctrine of the resurrection. We cite only the earliest: Clement of Rome, (1 Cor. 25); Justin, 'Contra Tryphonem,' 80; Athenagoras, 'De resurrectione carnis,' 3; Tatian, 'Adversus Græcos,' 6; Tertullian, 'Marcion,' v, 9, and 'De resurrectione carnis,' 1; Irenæus, 'Contra Hæreses,' i, 10; Minucius Felix, 'Octavius,' 34; Origen, in Matt. xxix; Hippolytus, 'Adversus Græcos' (in Migne, 'Patrologia Græca,' x, 799); Cyril of Jerusalem, Ephraim, Epiphanius, Basil and a vast list of later Fathers.

V. Resurrection of Christ.—One of the fundamental facts of Christianity is the resurrection of Christ; without this fact, the whole fabric of our apologetic falls to the ground and there is no hope of any life after death. "If Christ is not risen, vain is your faith, ye are still in your sins; yea, and they, that have passed to their rest in union with Christ, are lost. Why, if we have hoped in the mystic

union with Christ for this life alone, then are we the most to be pitied of all mankind" (1 Cor. xv, 16-19). Hence it is of prime importance to establish the resurrection of Christ as an historical fact. We do so from the four Gospels and the letters of Saint Paul, taken as historical documents, the substantial historicity of which no prudent man has any right to deny.

First, Jesus appealed to His future resurrection in proof of the truth of His claim that He was the Ambassador of God the Father and that he had from God the Father a message for the world. This fact is clear to any reader of the historical documents called Matthew, Mark, Luke and John. Witness the sign of Jonas: "Just as Jonas was in the belly of the sea-monster three days and three nights, so shall the Son of Man be in the earth three days and three nights" (Matt. xii, 39-41). Witness the sign of the Temple: "Destroy this temple, and in three days I will raise it up" . . . He was speaking of the temple of His body" (John ii, 18-22). Witness, finally, the repeated and detailed prophecy of the oncoming death and resurrection of Jesus: "He shall be delivered to the Gentiles; and shall be mocked, and scourged, and spat upon. And after they shall have scourged Him, they shall kill Him. And the third day He shall rise again." This prophecy is given, in substantially the same form, three times by Matthew (xvi, 21; xvii, 12 and 22, 23; xx, 18, 19); three times by Mark (viii, 31; ix, 11-13 and 30; x, 33, 34), and twice by Luke (ix, 22; xviii, 31-34). There can be absolutely no doubt about this fact. Jesus clearly appealed to His future resurrection in proof of the truth of His claim that He had from the Father a message for the world.

Secondly, Jesus arose from the dead to fulfill His prophecy in proof of the truth of His claim to divine ambassadorship, to the message from the Father and to the right to give that message to the world. This fact is denied only by those who start by throwing out of court miracles, prophecies and all supernatural elements of religion. Their theories are summed up under Christology (q.v.). Against these theories are the subjoined, clear facts of our documents. The chronological order of these facts is matter of dispute; of the facts themselves there is no doubt. They bear conclusive witness to the physical resurrection of Jesus. 1. The leaders of the priestly party and the Pharisees called to the attention of Pilate the prophecy of Jesus: "After three days I shall rise again." They demanded a guard, lest the disciples might steal the body of the dead Teacher and then say: "He is risen from the dead." The tomb was closed with a rolling stone; the stone was sealed with the official seal; a guard was set to prevent stealth (Matt. xxvii, 62-66). 2. Saturday evening, after sunset, the holy women visited the tomb, returned, bought spices and ointments (Matt. xxviii, 1; Mark xvi, 1; Luke xxiii, 56). 3. Christ arose early Sunday, the earth quaked, the angel rolled back the stone from the entrance to the tomb, the guards were terror stricken and lost consciousness (Matt. xxviii, 2-4). 4. While it was yet dark, Sunday morning (John xx, 1), the women started for the tomb; they arrived at daybreak (Mark xvi, 2) and found the stone

rolled back (Mark xvi, 3, 4; Luke xxiv, 1, 2); straightway Mary Magdalen returned to tell the apostles (John xx, 2). 5. The rest of the holy women entered the tomb and saw two angels standing (Luke xxiv, 3, 4) and one sitting (Mark xvi, 5); they were told that Jesus had risen, and were sent back to inform the apostles (Matt. xxviii, 5-8; Mark xvi, 6, 7; Luke xxiv, 5-11); but were so frightened as to say nothing (Mark xvi, 8). 6. After hearing the story of Mary, Peter and John ran to the tomb and found it empty (Luke xxiv, 12; John xx, 3-10). 7. Mary Magdalen returned to the tomb; Jesus appeared to her (Mark xvi, 9-11; John xx, 11-18). 8. Jesus appeared to the holy women, who had been affrighted by the vision of angels (Matt. xxviii, 9, 10); meantime the guards were bribed to say that the body of Jesus had been stolen by the disciples, while the soldiers were asleep (Matt. xxviii, 11-15). 9. Jesus appeared to the two disciples going to Emmaus (Mark xvi, 12, 13; Luke xxiv, 13-33). 10. The fourth apparition of Christ was to Peter (Luke xxiv, 34, 35). 11. Jesus appeared to 10 apostles at Jerusalem, in the absence of Thomas (Mark xvi, 14; Luke xxiv, 36-49; John xx, 19-25). 12. Eight days after these five apparitions of the first Easter Sunday, Jesus again appeared to the apostles, and this time Thomas was present (John xx, 26-31). 13. The seventh apparition was by the Sea of Galilee, to seven apostles; the Saviour then entrusted Peter with the primacy in shepherding His flock (John xxi). 14. On a mountain in Galilee, at the eighth apparition of the risen Saviour, He gave His Own world-mission to the apostles (Matt. xxviii, 16-20). 15. On Mount Olivet, Jesus repeated to His apostles the command to preach the Father's message to the world, and He then ascended into heaven (Mark xvi, 15-19; Luke xxiv, 50, 51).

Briefly, then, in nine apparitions recorded by the evangelists; and in three apparitions handed down by Paul alone—to James, to Paul, and "to more than 500 of the brethren at one time" (1 Corinthians xv, 3-8)—Jesus spoke, ate, walked and acted otherwise as He had acted before death. He proved to His followers that He was risen from the dead. In the court of historical evidence, there can be no prudent doubt of the validity of the testimony that we have summed up. Matthew, John and Paul were eye-witnesses of what they narrate. Mark and Luke had personal intercourse with the eye-witnesses of the risen Christ. Hence, first, our witnesses could readily have known the facts they handed down to us. Secondly, there is no reason to suppose that they falsified the facts they state. They intended to tell the truth in regard to the risen Jesus. They told the truth, as they deemed it to be truth. They had absolutely nothing to gain by telling the truth—nothing that the world deems worth the while. They had all to lose by telling the truth—all that the world rates high. To gain, they had poverty, contumely, failure in name and fame, by the propaganda of the worship of a crucified Man-God; by the spread of His otherworldiness—love of enemies, forgiveness of injuries, renunciation of wealth and power; and by death itself. Matthew and Paul were actually put to death for their pains in telling the truth about

Jesus; John endured tortures that naturally should have caused his death; Mark, also, was martyred for his witness to the truth that he wrote.

WALTER DRUM, S.J.,

Professor of Scripture, Woodstock College, Maryland.

RESURRECTION, a novel by Leon Tolstoy, published in 1900. It presents in the author's strongest manner the theme of the development of a great character, besides offering a picture of Russian society, from the wealthy office-holding circle, to the peasants and common soldiers, jailers and criminal classes. Nekhludoff, a noble, in the effort to right the wrong he has done to another, unconsciously rights the wrong done in himself by the false social outlook and inadequate education which had made him what he was and constructs for himself a new and broadly human creed of living.

RESURRECTION FERN. See **FERNS AND FERN-ALLIES**.

RESURRECTION PLANT. See **ROSE OF JERICO**.

RESURRECTION SISTERS. See **ORDER, RELIGIOUS**.

RESURRECTIONISTS, or **BODY-SNATCHERS**, a class of miscreants who, in Britain previous to the passing of the Anatomy Act of 1832, made a livelihood by rifling graves, taking out the corpses and selling them to schools of medicine and surgery as "subjects" for dissection or demonstration. So long as in Britain the supply of "subjects" from the gallows sufficed for the needs of the schools, there

was no call for a resort to illegal means. But when, in the progressive reform of criminal law, capital punishment was less frequently inflicted, while medical and surgical schools were greatly multiplied, the necessity for "subjects" overrode the laws, and the trade of the resurrectionist flourished. As the schools were mostly in London the graveyards in the vicinity of the metropolis were the main resource of the body-snatchers, with whom the grave-diggers and the caretakers were usually in league. As the business was naturally risky and precarious the price of "subjects" was, for each, \$40 to \$50. To protect the bodies of the newly interred their graves would be protected with strong gratings or spring-guns would be set at night, or the friends of the deceased would keep watch, armed, over the graves for several nights till the bodies had become unfit for use in the schools. These precautions made the business of the body-snatchers even more risky, and "subjects" would be sought in various localities throughout the kingdom. As the price paid by the doctors rose and the risk grew greater, it occurred to one Burke at Edinburgh to provide subjects for the dissecting table by killing people instead of violating graves. He was hanged at Edinburgh 28 Jan. 1829, convicted of having dispatched 15 victims and sold their bodies to the doctors. The first Anatomy Act of the British Parliament (1832) provides that schools of anatomy and teachers and demonstrators of anatomy shall be licensed; such schools and such teachers are empowered to receive as subjects for dissection the cadavers of persons dying friendless, in poorhouses, hospitals and elsewhere; and the trade of the resurrectionist was practically done away in Britain by the passage of the act. In the United States there are not in any of the individual States any statutes regulating the practice of anatomical dissection: the plundering of graves for subjects of dissection is a misdemeanor for which the offender may be indicted at common law. Instances are not very rare of the bodies of persons, not friendless, who die in public or quasi-public hospitals, being, without legal warrant, sold to the schools by subordinate employees of such hospitals. Body-snatching, or rifling of graves for the purpose of exacting a ransom from the families of the dead is not infrequent: a notable instance was that of the stealing of the body of A. T. Stewart, well-known New York merchant, in 1878, from the cathedral at Garden City, Long Island. The body-snatchers in this case demanded a ransom of \$200,000, which afterward they reduced to half that sum: finally, they received \$20,000 with the assurance that they should not be prosecuted. Since that time extraordinary precautions are taken against body-snatching from the graves, especially of very rich persons. Consult Bailey, J. B., ed. 'The Diary of a Resurrectionist' (London 1896).

RESZKE, rěsh'kě, **Edouard de**, Polish opera singer: b. Warsaw, 23 Dec. 1856; d. 30 May 1917. He studied at the Collège de l'Agriculture of Proskao, and then turned attention to the cultivation of his remarkable bass voice. He appeared in Paris in 1876 at the Théâtre Italien, and afterward in the large cities of Europe and America. He created the role of the King in Catalini's 'Edda' and Carlo V. in

Marchetti's 'Don Giovanni d'Austria' at Turin. He was especially identified with Mephistopheles in 'Faust'; Frère Laurent in 'Romeo et Juliette,' and the Wagnerian roles of Hans Sachs, Wotan and King Mark.

RESZKE, Jean de, Polish opera singer: brother of Edouard de Reszke (q.v.): b. Warsaw, 14 Jan. 1853. He completed the law course at the Warsaw University; but having been surrounded by a musical atmosphere in his home, and having sung as a boy in the cathedral, he decided upon singing as a career. He studied with Ciaffai and Cologni in Italy and made his début in Venice in 1874 as Alfonso in 'La Favorita.' In the two following years he appeared in London and Paris. Hitherto he had sung baritone roles, but in 1876 he retired to cultivate his natural voice whose register was that of a tenor. In 1880 he reappeared, singing at Madrid in 'Robert le Diable.' Following this he created the part of Jean in Massenet's 'Herodiade' in Paris and was engaged at the Opera where he sang from 1885 to 1890, appearing in 'Le Prophète,' 'L'Africaine,' 'Aida,' 'Faust,' 'Romeo et Juliette,' 'Don Juan,' and 'Le Cid' which Massenet composed for him. From 1893-99 he appeared continuously at the Metropolitan Opera House, New York, where he added to the foregoing roles several Wagnerian parts, particularly 'Siegfried.' In later years he was associated artistically with his brother Edouard. He retired from the stage in 1902 and subsequently devoted himself to vocal teaching in Paris.

RETAINING WALL, a wall usually of masonry, erected for the purpose of confining a body of water in a reservoir, or for resisting the thrust of the ground behind it. Without such a wall the earth would slide, or lie at a considerable angle off the perpendicular. A bank of rock may hold itself, but gravel, sand or loose earth will slide and wash away and requires a retaining wall to confine it. The amount of resistance or strength in the wall depends partly on the material held back and partly on the angle of repose, that is the angle beyond which the sand, gravel, etc., will slide. The pressure against the wall is produced by the material filling the space between the angle of repose and the face of the wall. As a general rule the thickness of retaining walls is made one-third the height of the bank which they are intended to support. In estimating the requisite thickness of the wall, account must be taken of the different ways in which it may be displaced, as by overturning, slipping along its entire base, or the giving way of the upper parts while the base remains. In reservoir walls of masonry, the thickness should be made practically double that of ordinary earth retaining walls. In the case of loose soil, readily rendered fluid by rains, as at Panama, the greatest engineering difficulties have been encountered. (See PANAMA CANAL). The great irrigation projects of the West and the Ashokan reservoir in New York presented vast problems in building retaining walls. Consult Cain, 'Practical Designing of Retaining Walls' (1914); Baker, 'Treatise in Masonry Construction' (1900); Merriman, 'Masonry' (1915). See DAMS; IRRIGATION; MASONRY AND BUILDING; RESERVOIR.

RETARDATION OF PUPILS. This term is popularly used by educators to mean that a pupil is old in years for his grade, on the basis of being in the first grade of the elementary school course at the age of six or seven years. According to this general plan all pupils who were eight years old or more, and were found in the first grade at any time during the school year would be considered as retarded. In the same manner all second grade pupils nine years old and over are retarded. This general standpoint of a leeway of two years in the standard age with its possible application at any time during the school year when the data may be collected from pupils and teachers is, however, far too loose in its application to serve as a very definite measure. The proper standard of age is that a pupil should begin the elementary school course at the first opportunity presented after he has passed his sixth birthday. In most cities this opportunity comes within six months, and the custom of midyear promotions is quite universal. In order to provide for those cities which promote only once a year, the standard should be made six years but less than seven years for beginning the first grade; seven years but less than eight years for beginning the second grade. This scale of pupils' ages is not based upon the mere fact that a pupil is in a *certain grade* at some time during the school year, but upon the pupil's commencement of the work of a certain grade involving the actual completion of previous grades. This definite standard has been adopted by the superintendents of New York State. Age is figured as of the nearest birthday. The exact definition of retardation is, however, not covered even by this well-defined plan of figuring age for beginning or completing a particular grade, because many children do not start school at the age of six years, but wait until they are seven or eight years old, and once entering their progress is in many cases entirely regular. The correct conception of a retarded pupil is one who has spent a *longer time in school* than the usual period required to finish a given grade or place him at the beginning of the next advanced grade. In other words, the normally progressing pupil completes one grade in one school year, and a retarded second grade pupil would be one who began that grade with more than one year of previous schooling; a retarded third grade pupil would be one beginning that grade with more than two years of previous schooling, etc.

The age basis alone is inaccurate for all pupils who do not happen to enter school between their sixth and seventh birthdays. On the basis of time-in-school, however, no pupil is charged with retardation unless he has actually spent more than the allotted time to achieve a given point in his school progress. Owing to the absence of complete progress records in schools at the present time, however, the age basis is the only measure on which information is available on a broad scale, and for this reason it is valuable and its compilation is worth while. Modern practice combines the tabulation of both age and progress figures. It is evident that a pupil may get an early start and make normal progress. Another may make a late start and progress

normally, and since a given pupil may be young, normal or overage, and may at the same time make rapid, normal or slow progress, we have nine possible categories of pupils with reference to these conditions, as follows:

- 1 Underage and rapid progress
- 2 Normal age and rapid progress
- 3 Overage and rapid progress
- 4 Underage and normal progress
- 5 Normal both as to age and progress
- 6 Overage and normal progress
- 7 Underage and slow progress
- 8 Normal age and slow progress
- 9 Overage and slow progress

These are best shown in the following arrangement of the groups:

Underage and rapid progress	Normal age and rapid progress	Overage and rapid progress
Underage and normal progress	Normal both as to age and progress	Overage and normal progress
Underage and slow progress	Normal age and slow progress	Overage and slow progress

According to this plan the results of the statistical research in the cities undertaking this work during 1916-17 are given.

An analysis of 46,000 pupils on this plan is given in Table 1, Fig. 1.

TABLE 1.

46,000 PUPILS IN TWENTY-TWO CITIES IN NEW YORK STATE.

PUPILS	Numbers				Percentages			
	Underage	Normal age	Overage	Total	Underage	Normal age	Overage	Total
Rapid progress..	1,356	1,195	820	3,371	2.9	2.6	1.8	7.3
Normal progress..	2,710	16,220	7,921	26,851	5.9	35.3	17.2	58.4
Slow progress..	315	3,148	12,338	15,801	0.7	6.8	26.8	34.3
Total..	4,381	20,563	21,079	46,023	9.5	44.7	45.8	100

Public school pupils commonly move from city to city, and within the same city they frequently transfer back and forth between parochial and public schools as well as from one public school to another. These changes in the location of pupils' schooling affect their progress to a considerable extent as shown in subdivision A, Table 2, and in Fig. 2.

FIG. 1.

Age and progress of elementary pupils.

This age-progress percentage chart represents the nine groups of pupils shown in the text just preceding table 1. The figures show percentages alone and not the actual number of pupils and correspond to table 1 to which additions were made after the figure had been drawn, which slightly changed the decimals in some of the percentage figures. The total of 100 per cent is the sum of the nine groups, not of the 15 other circles in the figure, 6 of which, 3 at the right and 3 at the bottom, are subtotals.

TABLE 2.
AGE-PROGRESS ANALYSIS OF 3,665 ELEMENTARY
PUPILS BY SCHOOL LOCATION.

A—All Pupils Enrolled.

PUPILS	Numbers				Percentages			
	Underage	Normal age	Overage	Total	Underage	Normal age	Overage	Total
Rapid progress...	120	96	101	317	3.3	2.6	2.8	8.7
Normal progress...	370	641	431	1,442	10.0	17.5	11.8	39.3
Slow progress...	119	353	1,434	1,906	3.3	9.6	39.1	50.0
Total.....	609	1,090	1,966	3,665	16.6	29.7	53.7	100

B—2,289 Pupils Schooled Entirely in Local Public Schools.

Rapid progress...	95	59	35	189	4.2	2.6	1.5	8.3
Normal progress...	323	500	208	1,031	14.1	21.8	9.1	45.0
Slow progress...	100	275	694	1,069	4.4	12.0	30.3	46.7
Total.....	518	834	937	2,289	22.7	36.4	40.9	100

C—836 Pupils Schooled Entirely in Two or More Local Public Schools.

Rapid progress...	19	11	8	38	2.3	1.3	1.0	4.6
Normal progress...	82	148	101	331	9.8	17.7	12.2	39.6
Slow progress...	60	98	309	467	7.2	11.7	36.9	55.8
Total.....	161	257	418	836	19.2	30.7	50.1	100

D—1453 Pupils Schooled Entirely in One School.

Rapid progress...	76	48	27	151	5	3	2	10
Normal progress...	241	352	107	700	17	24	7	48
Slow progress...	40	177	385	602	3	12	27	42
Total.....	357	577	519	1,453	25	39	36	100

E—785 Pupils Schooled Partly in Local Non-Public Schools.

Rapid progress...	5	14	42	61	0.6	1.8	5.3	7.7
Normal progress...	24	66	133	223	3.1	8.4	16.9	28.4
Slow progress...	9	45	447	501	1.2	5.7	57.7	63.9
Total.....	38	125	622	785	4.9	15.9	79.2	100

F—458 Pupils Partly Schooled in Other Cities.

Rapid progress...	18	21	21	60	3.9	4.6	4.6	13.1
Normal progress...	20	66	66	152	4.4	14.4	14.4	33.2

Total.....	48	116	294	458	10.5	25.3	64.2	100

G—133 Pupils Partly Schooled in Foreign Countries.

Rapid progress...	2	2	3	7	2	2	2	6
Normal progress...	3	9	24	36	2	6	18	26
Slow progress...	0	4	86	90	0	3	65	68
Total.....	5	15	113	133	4	11	85	100

This table shows that at the very start there are three types of location factors which have to be analyzed quantitatively before the superintendent can even begin to interpret his own age-progress figures: (1) changes within his

system, (2) the combination of public and parochial schooling, and (3) the combination of local and out-of-town schooling. The great difference between the number of pupils who are overage, who are slow and who are both old and slow shows the inadequacy of either age or years-in-school alone as a measure of retardation, and the handicap under which those superintendents are working who have not the aid and support of a complete system of individual permanent record cards, so essential to the demands of modern supervision considered

PERCENTAGE OF PUPILS
BOTH OVER-AGE & SLOW-PROGRESS

FIG. 2.

This figure should not be misinterpreted as showing the relative number of pupils who have been schooled entirely in the local system or have come into it from the outside. It represents groups of pupils based on the location of their previous schooling, ranging in size from 133 pupils partly schooled in foreign countries to the grand total of 3,665 found in the public schools at the time of the survey. Each circle represents 100 per cent of its own group and the black sector shows the percentage of those that are retarded.

locally and entirely apart from any collective research such as this discussion. Even the sevenfold table does not tell the complete story of local and outside retardation, to determine both of which requires the correlation of each pupil's progress with the proportion of his total schooling received in the local public system and obtained elsewhere, a task which, while somewhat involved, is quickly accomplished by means of the mechanical tabulation of the statistics with electrical machines.

Analysis by Grades.—Tables 1 and 2 present figures for all pupils in a city system b

longing to the several groups. In order to gain an adequate notion of the retardation in a school system it is essential to have a separate analysis of each of the eight regular grades of

the elementary course. The extent to which slow progress varies in the different grades is shown in Table 3, Fig. 3.

TABLE 3.
PROGRESS PERCENTAGES OF 286,207 PUPILS IN 41 CITIES, 29 VILLAGES AND 493 UNION FREE SCHOOL DISTRICTS.

GRADE	Rapid	Normal	1 year slow	2 years slow	3 years slow	4 years slow	5 years slow	6 years slow	Total slow	Total

FIG. 4.

School Systems of Different Sizes.—In addition to the analysis by school locations and by grades, it is very essential not to limit the study of retardation to one school system, but to gather similar data from a number of school systems of comparable size. When this has

been done the figures should be tabulated in the order of the slow progress percentage of each contributing place. Such an arrangement is graphically represented in Fig. 4 above, and shown in Table 4 on the following page.

This table means that the retardation in this group of villages ranges from 2 per cent to 76 per cent, the midpoint of the series of

medium being 32 per cent and the two quartile points which include the middle half of the series being 22 per cent and 42 per cent respectively. Reading across the top line, the table is interpreted as follows:

Two per cent slow progress is reported by one village.

Zero per cent of pupils retarded two years or more is reported by 23 villages.

The second line means that 5 per cent slow progress is reported by one village, and one village reports 1 per cent of pupils retarded two or more years. It should be emphasized that the particular percentage of retardation which happens to be the median of such a table is by no means the normal amount of retardation which should be expected, or which would represent satisfactory school conditions. Slow progress percentages reported by cities and villages in New York State, May 1917, are shown in Table 5.

Correlation with Other Factors.—A complete study of retardation should show conditions relating not only to the retardation of pupils but should give this information in connection with the health of the pupil, and with his ability to perform the now thoroughly tried and permanently established standard classroom tests used by modern superintendents as a part of their regular supervisory program. It is interesting to note in Table 5, that average pupils are by no means confined to those having physical defects, but that in this single illustration a large majority of the pupils with physical defects are of normal age and even underage.

School Retardation and Mentality.—The fact that a pupil may have started school at the age of seven or eight instead of six years or that he may have required an extra year to place him in a given grade does not in any way prove or indicate that there is anything the matter with his mind, as either or both of these circumstances may obtain in the case of a pupil of normal intelligence. Retardation in school is by no means synonymous with mental subnormality. Some of the factors contributing to retardation in school are the following:

- a The late entrance of pupils into the first grade.
- b Varying practice in promoting children into and out of the first grade.
- c Different standards of promotion from grade to grade.
- d Differences in the health of pupils while at school.
- e Varying degrees of regularity of attendance.

f Different degrees of familiarity with the English language.
g Differences in the mentality of normally intelligent children.

h The presence of mentally subnormal children in regular classes.

i Physical defects of children.

k Differences in the maturity of children.

l Differences in the home environment of children.

m Differences in the amount of time which children may devote to the preparation of lessons outside of school.

n Circumstances incident to the moving of families from place to place.

o The transfer of pupils from one school to another and from parochial to public schools within a city.

p Differences in the type of pupil left in the system when others have been removed.

q Differences in the extent to which communities offer inducements for pupils to leave school.

Rochester, N. Y., considerable attention has been given to the preventive and remedial measures used by elementary teachers against retardation. It is significant to note that where teachers have reported in detail their efforts to reduce retardation, they have enumerated measures all of which should be employed by every good teacher in her regular work with normally successful pupils as well as with those in danger of non-promotion. There is indeed little doubt that the most effective way to reduce retardation is to improve the teaching itself, and this is already the superintendent's constant problem.

TABLE 6.
UNDER, NORMAL AND OVERAGE AND PHYSICAL DEFECTS.

GROUP OF PUPILS	Without physical defects	With physical defects	Total	Percentages		
				Without defects	With defects	Total
Underage....	22	79	101	4.2	15.2	19.4

Total....	112	406	518	21.5	78.5	100

Variations in pupils' progress through school and variations in the mentality of children are shown in Figs. 5 and 6, from which it is clear that the factors listed above combine to bring about the result that while there appear to be actually more bright children than dull children, there are relatively fewer who make rapid progress through school than the proportion making slow progress.

Preventive and Remedial Measures.—The query naturally arises, now that we have this information about non-promotion, What is to be done about it? In several places, notably in

Many cities have certain features in their organization, which, entirely apart from the effort to improve the effectiveness of the instruction in the regular classroom, make it easier to grapple with the retardation problem and have been of material assistance in reducing its effects. These special features in the organization of the school and of the whole local system do not apply to pupils who are making normal or rapid progress but to retarded pupils and those in danger of non-promotion, and for this reason they may be called preventive and remedial measures with more propriety than those which ought to be a feature of the effective and successful teaching of all pupils. A list of some of these measures is given by way of illustration.

1. **Primarily Concerning the Teaching.**—
A. Those which allow the pupil repeating the grade to remain with the class which is regularly taking the grade for the first time. The remedial work is performed by the teacher in the course of her regular instruction and the retarded pupil is supposed to have the chance of finishing the grade with the rest of the class.

B. Those which involve the services of an assistant working in the classroom with the regular teacher.

C. Those which involve a temporary transfer to a special class and a prospective return to the regular grade in time to complete it with the class at the close of the term.

FIG. 5.

Rapid, normal and slow progress of 286,207 elementary pupils in 563 public school systems in New York State.

This figure shows where the schools have the children located with reference to the normal advancement of one grade a year. Note that relatively a larger number of pupils are found on the slow side of the normal than in the portion of the diagram representing rapid pupils.

D. Those which involve a transfer to a special class with a return to regular work some time after the class from which the transfer was made has completed the work of that grade.

- (1) Ungraded classes.
- (2) Foreign classes.
- (3) Special catch-up classes.
- (4) Classes for atypical pupils.
- (5) Open-air classes.

E. Those which involve the substitution of a modified, though regularly graded, course of study in place of the regular elementary curriculum.

F. Those which involve a transfer to another sort of school or institution which substitutes a special curriculum for that of the graded school.

2. Primarily Concerning the Administration of the School.—Those which relate to the principal's office and to the school district as a unit rather than to the instruction in the classroom. The keeping and actual use of special individual records of scholarship, health and standard test results; special features of organization within the school and of co-operation with the home.

3. Primarily Concerning the Administration in the Entire Local School System.—Those which relate to the department as a whole and to co-operation with other city departments and organizations. Analysis of retardation records of schools and use of data in the supervisory program. Employment of clerk or establishment of a bureau of research

and educational measurement. Co-operation with all city departments having to do with children. Study of the methods used in other cities of comparable size.

Retardation Survey.—In order to make a study of this problem in a school system, it is necessary to obtain for each pupil enrolled the following information:

1. The date of birth.
2. The date of entrance into the first grade (not kindergarten).
3. The number of terms (one-half years) of schooling received and grades or half grades completed in each of the following school locations:
 - a School where registered.
 - b Other local public schools.
 - c Local parochial or private schools.
 - d Any schools in other cities.
 - e Schools in foreign countries.
4. Grades or half grades skipped or doubly promoted.
5. Grades repeated or doubly repeated.
6. Note of extraordinary circumstances favorable to progress.
7. Note of extraordinary circumstances unfavorable to progress.

FIG. 6.

Intelligence distribution of 1000 unselected children.

This figure should be examined in connection with figure 5. Note that so far as the children's minds are concerned: (1) the number below normal is considerably less than the proportion of children whose progress through school is below normal as shown in figure 5, and (2) that the number of children who appear in any way to be mentally slow is more than counterbalanced by the number of children of corresponding degrees of mental superiority. This is in marked contrast to the relatively few children who are making rapid progress through school. This figure is a modified form of a diagram in "The Measurement of Intelligence" by Lewis M. Terman, published by the Macmillan Company and reproduced here with the permission of the author and the publishers. Together figures 5 and 6 would appear to show that there is considerably more trouble with the children's schooling than there is with their minds, and that whatever is the matter with their schooling is quite out of proportion to anything wrong with their minds.

The most effective manner of assembling retardation data in the tables is to resort to the mechanical tabulation of these statistics by means of electrical sorting and tabulating machines, in which process a small card containing all the necessary information is punched for each pupil. These cards are then run through the machines any desired number of times in order to make sortings based upon the

different angles from which the situation is to be viewed.

New York State Department of Education.

RETENTIVENESS, a quality of memory by which the after-effects of mental process are long held, with capability of reproduction. Retention is of primary importance in judgment, particularly in the study of processes that are continuous, or in which there is a continuity of interest. Thus when one hears a succession of sounds and judges that the second, for instance, is louder than the first, the property of retention, by which the after-effect of the hearing of the first sound is compared with the second, is of great importance. In many this attribute of retentiveness is weak, seriously impairing their judgment. See JUDGMENT; MEMORY AND ITS DISORDERS.

RETHEL, rä'tél, Alfred, German painter: b. Aix-la-Chapelle, 15 May 1816; d. Düsseldorf, 1 Dec. 1859. He studied at the Academy of Düsseldorf (under W. Schadow) and afterward at Frankfort (under Philip Veit and Schwind). Here he painted 'The Resurrection of Christ' (in the church of Saint Nicholas), 'Daniel' (in the city museum) and 'Justice Pursuing a Fleeing Murderer.' When there was a competitive exhibition held of designs for frescoes in the town-house of Aix-la-Chapelle representing incidents in the life of Charlemagne, he was chosen to do the work, and lived to complete four of them; the other four being executed from his designs after his death. These are considered the finest productions of his brush. He painted in water-color a series of pictures illustrative of 'Hannibal's Passage of the Alps,' which were afterward reproduced by wood engraving. In 1848 he executed his 'Dance of Death,' and drew a number of designs on wood. His style was notable for grandeur and energy, and his frescoes are among the finest modern examples of that style in Europe. In 1852 he was seized with a nervous affection for which he sought relief by traveling, but died insane.

RETIARIUS, rē-shi-ä'ri-üs, a netman, that is, a Roman gladiator who wore a short tunic and carried a trident and net, with which he endeavored to entangle and dispatch his adversary, who was armed with helmet, shield and sword.

RETIF DE LA BRETONNE. See RES-TIF DE LA BRETONNE, NICHOLAS EDMÉ.

RETINA. See EYE.

RETREAT, Spiritual, or **RETREAT**, in devotional language, a season of retirement from ordinary secular occupations and of

prayer, of meditation upon the truths of religion and the duties of the Christian life, of examination of the conscience, of serious consideration of one's spiritual state, etc. The retreat is also called the spiritual exercises, that being the name given to it by Saint Ignatius de Loyola, whose plan of the exercises (*Exercitia spiritualia*) has ever since his day been the directory of the spiritual retreat. The exercises are arranged for a retreat of four weeks, but usually the time is abridged to 10 days or a week. See SPIRITUAL EXERCISES, THE.

In military language, a retrograde movement, whether forced or strategical, by which troops retire before an enemy: it differs from a flight in being orderly and under control. An army in retreat must be covered by a powerful rear-guard, which from time to time must, if the enemy is pursuing, hold the pursuers at bay, while the artillery and the baggage pass defiles, cross streams or overcome any obstacles.

RETRIBUTION, in anthropology and in law: in anthropology the retribution theory expresses the belief in states of happiness or of misery in another world, allotted to men according to their deserts while living on earth. Tylor ('Primitive Culture,' Chap. 13) does not find this idea existing universally in the religions of the lower range of culture that have not been affected by contact with higher religions. The most primitive view of the life beyond the grave was, he holds, that it is simply a continuation of the present; to this succeeds the belief that excellence, valor, social rank, etc., modify circumstances and surroundings in the next life; out of this, he believes, was finally developed a doctrine of future rewards and punishments.—In law, the theory of retribution, or retributive theory is, that punishment is inflicted in retribution for an offense, and ought to be similar to the misdeed: this is the principle of the retribution prescribed in the Hebrew law—"an eye for an eye, and a tooth for a tooth." In modern legislation deterrence displaces retribution: it is held that no more punishment should be inflicted than suffices to deter others from committing the offense: even the death penalty is not defended on the principle of "life shall go for life," but because with abandoned criminals capital punishment has a more deterrent effect than has life imprisonment.

RETRIEVER, a dog, trained to find out and bring back any killed or wounded game. The two varieties of British retriever differ only in coat. The larger and more familiar breed of retrievers, the wavy-coated, is formed by crossing the Newfoundland and the setter; the smaller or curly-coated breed is formed by crossing the water-spaniel and the terrier. The typical retriever is 20 or more inches high, with a stoutly-built body, strong limbs, webbed toes and black and curly fur. See DOG.

RETURN OF THE NATIVE. The (1878), one of the masterpieces of Thomas Hardy and perhaps the best of all his earlier novels, deals with the people in the very center of his favorite land of "Wessex." The scene never leaves Egdon Heath, and on this sombre uniting of various real places in the south of England, somewhat to the west of the Isle of Wight, a very intense tragedy is enacted. It

conceived on classic lines, and is simple, clear and fateful. It is a story of the interruption of and sinister effect upon the ordinary life of the people caused by acts of will and wilfulness. Eustacia Vye, one of the most perfectly delineated women in modern English fiction, wishing relief from the *ennui* of the restricted life on the heath seeks diversion in the admiration of Wildeve, but seeing a chance for positive escape in the return from Paris of the "native," Clym Yeobright, marries him, only to find herself, on the threatened loss of his eyesight, the wife, not of a Paris jeweler, but a day laborer on Egdon. Attempting to flee with Wildeve, both are drowned on the edge of the heath. Meanwhile the course of these events has marred the life of Thomasin, Wildeve's wife, has estranged Yeobright from his mother, and caused the death of the latter. As in many of Hardy's works the wilfulness of one character like a kind of fate operates to disturb and ultimately to upset the lives of several people, and only when Eustacia finally involves herself in the general ruin does life resume its normal though altered course. The tragedy is an extremely vivid and powerful one, although severely localized. It is very richly set in the background of local customs, habits and characters, all of which are given an extraordinary unity and impressiveness through the dominance of Egdon Heath.

WILLIAM T. BREWSTER.

RETURNING BOARDS. All State governments have provision for the final canvass of votes in State elections by some central authority, known as a returning board, or by some similar designation. The duties of these boards are ministerial, and they have no right to go outside the face of the returns. In the Presidential election of 1876 the returning boards of Florida, South Carolina and Louisiana, controlled by the "carpetbag" and negro element, went behind the returns, and assumed to cast out sufficient votes on the ground of alleged fraud and intimidation to give those States to the Republican electors. A great ferment resulted, and in order to allay the agitation and arrive at a correct conclusion, an electoral commission was appointed, which decided in favor of the Republican candidate, Rutherford B. Hayes. See **ELECTIONS**; **ELECTORAL QUALIFICATIONS**; **CONGRESS**.

RETZ, rêtz, RAIS, râz, or RAYS, râz, Gilles de Laval de, French military officer: b. 1404; d. 26 Oct. 1440. He was a Breton of high rank, and distinguished himself under Charles VII in the struggle with the English, fighting by the side of the Maid of Orleans. Subsequently he received the baton of marshal. He retired to his estates, but was brought to trial by the Bishop of Nantes, charged with sorcery and the practice of cruelty in the celebration of demoniac rites. He was convicted and burned. Attempts were once made to find in Retz a historical original of Bluebeard, but, of course, in vain.

RETZ, Jean François Paul de Gondî, CARDINAL DE, French politician: b. Montmirail, 19 Sept. 1613; d. Paris, 24 Aug. 1679. His instructor was the celebrated Vincent de Paul. In 1643 he received a doctorate at the Sorbonne, and was appointed coadjutor of the archbishop of Paris. Although preferring military service

he found he could gratify his ambitions in the church and his impassioned eloquence won him the favor of the Parisians. Aiming at political influence he incurred the enmity of Richelieu, and, after his death, of Mazarin. The Fronde, or the party opposed to the court and Mazarin, received the coadjutor as a man whose genius and popularity made him a valuable accession, and De Retz embraced their cause with zeal. The various insurrections of the people and the Frondeurs obliged Mazarin to leave France, whereupon De Retz seemed to have it in his power thenceforth to hold the reins of government. But Mazarin soon returned from his banishment, more powerful than ever. The Fronde, which had never been firmly united, and the members of which, with the exception of Condé and De Retz, were weak and wavering, was dissolved; and soon after the latter, not without the management of his enemy Mazarin, had obtained the cardinal's hat, he was unexpectedly seized and confined in the castle of Vincennes, whence he was subsequently removed to Nantes. Here he found means to escape, and, perpetually pursued by officers of Mazarin, wandered for eight years through Europe. After the death of Mazarin in 1661 he was allowed to return to France, after having promised never to take part again in political combinations. He now resigned his archbishopric, governed the abbey of Saint Denis, lived retired, restricted his wants, paid his immense debts, and distributed pensions to his friends. Reconciled with all parties he lived the retired and quiet life of a philosopher. His posthumous 'Mémoires' (1718) give an interesting picture of his character. They were praised by Voltaire and were drawn upon by Dumas for contemporaneous pictures in his 'Vingt Ans Après.' The best edition of his works is that in the 'Grands Ecrivains de la France' series (1872-90). An abridged edition was published in 1865 in one volume. Consult Chantelauze, 'Le Cardinal de Retz, Etude historique' (1878); 'Le Cardinal de Retz et ses Missions diplomatiques à Rome' (1879).

RETZSCH, rêtsh, Moritz, German artist: b. Dresden, 9 Dec. 1779; d. Hofflossnitz, near Dresden, 11 June 1857. As a painter his subjects were taken largely from German and Greek mythology and display beauty in drawing and color. Retzsch's illustrations of the great poets, comprehending the drawings executed by him for editions of Goethe's 'Faust,' and the works of Schiller and Bürger, have rendered him deservedly famous. He executed a 'Shakespeare Gallery' consisting of 80 plates. In 1824 he was appointed a professor in the Art Academy at Dresden. His illustrations of poetry and legend were done in outline and are distinguished by exquisite delicacy and refinement of form and expression.

REUCHLIN, roikh'lin, Johann (Hellenized KAPNIO), German Hebrew scholar and humanist: b. Pforzheim, Baden, 22 Feb. 1455; d. Liebenzell, 30 June 1522. The excellence of his singing procured him a place in the chapel of the Margrave of Baden, who appointed him traveling companion to his son Frederick, afterward bishop of Utrecht. In 1473 Reuchlin accompanied that prince to Paris, and there studied Greek under Hieronymus of Sparta, besides applying himself assiduously to Latin

composition and Hebrew. In 1475 he went to Basel, and after some time spent in the study of Greek began to teach that language, with Latin and philosophy. At this time also he wrote his Latin dictionary *Breviloquus, id est Dictionarium singulas Voces Latinas breviter explicans* (1478), the first published in Germany. In 1478 he went back to France, and studied law at Orleans, while he taught, at the same time, the ancient languages. In 1481 he returned to Germany, and taught law and the belles-lettres at Tübingen. Eberhard, count of Würtemberg, soon after took him, as the best Latinist in Germany, in his train on an embassy to Rome. The Emperor Frederick II created him a noble of the empire in 1492. After Eberhard's death Reuchlin lived several years at the court of Philip, elector of the Palatinate. Here he enriched the Heidelberg library with manuscripts and productions of the new art of printing. He was subsequently appointed president of the court of the confederacy which had been established by the Swabian princes against the encroachments of the house of Bavaria. He was also engaged in translating the penitential psalms, preparing a Hebrew grammar and dictionary, and correcting the translation of the Bible. A converted Jew, John Pfeffercorn, and Hoogstraten, an inquisitor, obtained from the Emperor Maximilian, in 1509, an order that all Hebrew works, the Old Testament only excepted, should be burned, on the ground that they were full of blasphemies against Christ. The emperor, however, consulted Reuchlin, who assured him that these works, instead of injuring Christianity, contributed, on the contrary, to its honor and glory, since the study of them produced learned and bold champions to fight for the honor of the Christian religion, and that to destroy these books would be to put arms into the hands of its enemies. The order was thereupon recalled, but the war of pens raged for 10 years. Passages were extracted from Reuchlin's works and their meaning perverted; on the ground of which a charge of heresy was brought against him. He was summoned in 1513 before the Inquisition at Mainz, presided over by Hoogstraten, and by a decree of that tribunal his writings were consigned to the flames. This roused the indignation of the friends of classical literature, and an appeal was made to Pope Leo X, who referred the whole matter to the Bishop of Spire. That prelate declaring Reuchlin innocent, ordered the monks to pay the expenses of the investigation. A counter appeal was made by Hoogstraten; but Reuchlin was then acquitted by a commission of prelates held at Augsburg in 1516; and the pope issued a mandate that all proceedings against Reuchlin should be stopped. In the course of this contest appeared the *'Epistolæ Obscurorum Virorum,'* in which the enemies of Reuchlin were ridiculed. When, in 1517, he received the theses propounded by Luther, he exclaimed, "Thanks be to God, at last they have found a man who will give them so much to do that they will be compelled to let my old age end in peace." In 1518 he was appointed professor of Hebrew and Greek at Wittenberg, but sent his nephew Melanchthon instead, and William of Bavaria appointed him professor in the University of Ingolstadt. Although suspected of a leaning toward Protestantism, he never left the Roman Catholic

Church. Consult Geiger, *'Johann Reuchlin: sein Leben und seine Werke'* (1871); Geiger, L., *'Johann Reuchlins Briefwechsel'* (1875); Horawitz, A., *'Zur Biographie und Korrespondenz J. Reuchlin'* (1877); Holstein, H., *'J. Reuchlins Komödien'* (1888); Hirsch, L. A., *'Johann Reuchlin'* in *'A Book of Essays'* (New York 1904).

REUNION, *Ile de la, el dé là rā-ū-nē-ôn*, or **ISLE OF BOURBON**, in the Indian Ocean, about 400 miles east of Madagascar, a French insular colony, with an area of 970 square miles, its length being 45 miles and breadth 33 miles. It was discovered by Mascarenhas, a Portuguese, in 1545, who called it by his own name. The French took possession in 1649 and gave it the name of Bourbon. It was captured by the British in 1810 and restored to France in 1815. The island is of volcanic origin, composed of two enormous volcanic mountains, in one of which the fire is extinct; the other is still in activity. The loftiest summit, Le Piton de Neige or the Snowy Pike, is about 10,000 feet above the level of the sea. The climate is excessively hot from November to April; the evenings, however, are refreshed by the sea breezes, and the mornings by the land breezes. The capital is Saint Denis, a pretty town; pop. 23,972. Other urban centres are Saint Pierre (29,481), Saint Paul (18,646) and Saint Louis (13,346). The towns are under French municipal law. The island has a lycée with 25 teachers and 350 pupils. There are 163 elementary schools with 373 teachers and 15,837 pupils. The chief port, Pointe-des-Galets, is connected by a coast railway of 80 miles with Saint Benoit on the one hand and Saint Pierre on the other. In 1888 this railway was taken over by the state. The total value of imports in 1916 was \$4,679,413, and of exports, \$6,634,901. In the same year 91 vessels of 216,638 tons entered and 92 vessels of 220,054 tons cleared at the ports of the island. The public debt is about \$900,000. The principal articles of export are coffee, sugar, vanilla, gums, lichens for dyeing, cotton, hides, etc. Sugar is by far the most valuable export; vanilla comes next. Commerce is impeded by the want of good harbors. The population consists of 173,822, comprising 159,218 Europeans, 8,341 British Indians, 1,868 natives of Madagascar, 2,927 Africans, 884 Chinese and 584 Arabians. Here, as elsewhere, the French have not shown themselves successful colonizers. It would appear that only the British, Americans and Russians possess this faculty to any high degree.

REUS, *rā'oos*, Spain, in the province of Tarragona, is an important railway station and a progressive town, with a port at Salou on the Mediterranean, four miles distant. It has excellent schools and model public institutions. Its importance as a commercial centre has increased in a marked manner during the last quarter of a century. Its export houses represent great local industries in the agricultural products of flour, wine and fruit.

REUSCH, *roish*, Friedrich, German sculptor: b. Siegen, Prussian Westphalia, 5 Sept. 1843. He received lessons at the Berlin Academy, and afterward from Albert Wolff. In 1874 he traveled in Italy for purposes of study and on his return executed some military statues

for Siegen and Bensberg, and a group in marble for the Belle Alliance bridge at Berlin. A lucky inspiration was his 'Demon of Steam.' This spirited and highly original work was modeled in 1880, and subsequently cast in bronze and set up in the Scientific High School at Charlottenburg. He became teacher in the Art Academy of Königsberg (1881), and meanwhile executed numerous busts and statues for public buildings; the monuments of Vessel, the astronomer, and Jacobson, the oculist; the sepulchral monument of General Bronsart von Schellendorf, and the colossal figure of Emperor Wilhelm I in his coronation robes which stands in front of the palace (1894). Of his imaginative works the most notable are 'Psyche Appeasing Cerberus'; 'Cupid Putting on the Helmet of Mars'; and the 'Triumph of Cupid over Hercules.'

REUSS, Germany, two central principalities belonging to an older and a younger line, somewhat intermingled with and lying between Saxony, Bavaria and the Saxon duchies. Total area of both principalities, 441 square miles, mostly mountainous. The territory of the older line, the principality of Reuss-Greiz, consists of the lordships of Greiz and Burgk, and has an area of 122 square miles. These lordships are separated, one being traversed by the White Elster, while the other lies along both banks of the Saale. The surface is better adapted for pasture than agriculture, rearing great numbers of horned cattle and sheep, but scarcely raising grain sufficient to meet the consumption. The most important crops are potatoes and flax; hops also are partially grown. The weaving of woolen, linen and cotton fabrics is also among the principal occupations of the people. The capital is Greiz, and the only other town is Zeulenroda. The territories of the younger line, called the principality of Reuss-Gera-Schleiz-Lobenstein-Ebersdorf, have together an area of 319 square miles. These territories are, on the whole, fertile and well wooded, raise sufficient grain to supply the consumption and possess among their minerals marble, salt and iron. The capital is Gera, and other towns are Schleiz, Saalburg, Hirschfeld and Lobenstein. The division into an older and a younger branch dates from 1616. Since 1668 all the princes of both lines have been called Heinrich (Henry). Both lines, as well as the great majority of their subjects, are Protestants. The principality of Reuss-Greiz has a population of about 72,500; Reuss-Schleiz, of 152,750.

REUSS, Switzerland, a tributary of the Aar, rising on the north face of the Saint Gothard, flowing north past Andermatt and Amsteg, between which places its course is through a wild and narrow gorge, spanned by the Devil's Bridge and other wonders of Swiss roadmaking, and entering the south end of the Lake of Lucerne. This it leaves again at its north end, at the town of Lucerne, and still going nearly due north, reaches the Aar near Windisch (Aargau). Its length is 90 miles.

REUTER, ro'i'ter, Fritz, German dialect poet and story writer: b. Stavenhagen, Mecklenburg-Schwerin, 7 Nov. 1810; d. Eisenach, 12 July 1874. He studied law at the universities of Rostock and Jena, and in 1833 was condemned to death at Berlin for his share in a students' democratic society. His sentence was,

however, commuted by the king to 30 years' imprisonment. Till 1838 he was a close prisoner in various Prussian fortresses, and after a farther period of confinement in the Mecklenburg fortress of Dömitz was set free in 1840. For 10 years he devoted himself to farming but in 1850 became a private teacher in the Pomeranian town of Treptow. In 1853 he was made famous by the publication of humorous poems in the Platt-Deutsch dialect, entitled 'Läuschen un Rimels' (new series, 1858). These were followed by 'Polterabendgedichte' (1855) and 'Reis' nah bellegen' (1855). His later works comprise 'Kein Hüsung' (1858); a tragical village story in verse; 'Hanne Nüte und de lütte Pudel' (1859); 'Schürr-Murr' (1861), a collection of tales in both Low and High German; and 'Olle Kamellen' (1860-68), his chief prose work, a series of tales in Platt-Deutsch, including 'Ut de Franzosentid' (1860); 'Ut mine Festungstid,' an account of his conviction, and imprisonment (1862); 'Ut mine Strontid,' his masterpiece (1864); 'Dörchlauchting' (1866); and 'De Reis' nah Konstantinopel' (1868); 'Die Drei Langhause' (1878), a satirical play; 'Lustspiele und Polterabendgedichte' (1883); and 'Reuter-Reliquien' (1885). Reuter's stories are lacking in plot, but are marked by clever episodes, skilful character drawing and a humor, which, despite the difficulty of his medium, was universally appreciated in Germany. An edition of his works appeared in 1863-68, and in 1875 two volumes of 'Nachgelassene Schriften,' with biography, were added by Wilbrandt. Consult Ebert, H., 'Fritz Reuter, sein Leben und seine Werke' (Güstrow 1874); Gädertz, K. T., 'Aus Fritz Reuters jungen und alten Tagen' (2d ed., 3 vols., Wismar 1897-1901); Glagau, O., 'Fritz Reuter und seine Dichtungen' (2d ed., Berlin 1875); Römer, A., 'Fritz Reuter in seinem Leben und Schaffen' (Berlin 1895); Thurber, C. H., 'Fritz Reuter' (Boston 1914).

REUTER, Paul Julius, BARON, German telegraph promoter: b. Cassel, Germany, 21 July 1816; d. Nice, France, 25 Feb. 1899. He settled in Aix-la-Chapelle in 1849, where he first established his system of transmitting news by telegraph to the leading towns on the Continent, and in 1858 removed to London, where he undertook to supply the English newspapers with foreign news. His enterprise, known as "Reuter's Agency," occupied a unique field and grew in importance from year to year until it is now in operation in all parts of the world. In 1865 he obtained the permission of the government to lay a cable from England to Cuxhaven, and shortly after to lay one between France and the United States. In 1872 the shah of Persia granted to him the exclusive rights of constructing railways, farming customs and control of the natural resources of the country, but later exchanged these privileges for that of establishing the bank of Persia. He was created baron by the Duke of Saxe-Coburg-Gotha in 1871.

REUTER AGENCY, an English news service opened in London by Julius Reuter in 1851, and now the most important institution of its kind in the British Empire. It has correspondents in all the great news centres of the world and furnishes telegraph and other news features throughout the eastern hemisphere and,

to some extent, to Latin America, the United States and Canada. See PRESS ASSOCIATIONS; REUTER, PAUL JULIUS.

REUTERDAHL, roi'tèr-dal, Henry, American naval artist: b. Malmö, Sweden, 12 Aug. 1871. He received his academic education at Stockholm, Sweden, and after remaining in this country served as newspaper correspondent during the Spanish-American War. He has contributed to various prominent periodicals in this country and England, and illustrated the 'History of the New American Navy' (1903) by John D. Long (q.v.).

REUTLINGEN, roi't'ling-ën, Germany, in Württemberg, capital of the circle of the Schwarzwald or Black Forest, on the Echaz, affluent of the Neckar, 20 miles south of Stuttgart. The church of Saint Mary is of great antiquity (13th century), and its tower, 325 feet high, of Gothic type, considered the most beautiful in the kingdom. The environs of the town are most romantic. Its leather and textile industries are important.

REVEILLÉ, rê-väl'yě, or rêv-ě-lě', the signal given in camp and garrison at break of day, by beat of drum or sound of bugle, for the soldiers to rise and begin the duties of the day.

REVEL, rêv'él, or **REVAL**, rêv'äl, Russia, capital of Esthonia, on a small bay of the same name, 238 miles southwest of Petrograd. The ancient part of the city on a rocky eminence is surrounded by Gothic walls and contains the cathedral, castle, governor's residence, high school and aristocratic quarters; other churches, the town-hall, several fine halls, schools, etc., are located in the lower, or commercial town. There are two harbors: mercantile and naval. Commerce is comparatively unimportant. Flax, linseed, grains, skins and potato brandy are exported; salt, wine, fruits and manufactured and colonial goods imported. Pop. about 68,000.

REVELATION, in *theology*, the communication of truth by God to men; also, the truth so conveyed, and especially in the Scripture. There is a revelation of God's will and his purposes made through man's reason and the voice of conscience: Nature everywhere reveals God's attributes—his power, his goodness, his wisdom, his providence; so, too, the history of the tribes of mankind upon the earth affords proofs of divine governance. But the most express revelation of God's purposes toward man is made in the written word, in the record of special divine communications made in time past to holy men "who spake as they were moved by the Holy Spirit"; and this written word is the key to all the other revelations of the divine nature and the divine will. See INSPIRATION; BIBLE.

REVELATION OF JOHN. The last of the canonical books of the New Testament.

General Character.—The book, as its name implies, purports to be a *revelation* (ἀποκάλυψις, an "uncovering") or unveiling of the secrets of the divine purpose in reference to God's Kingdom on earth in its conflict with the forces of evil. As such, it is one of a large number of Apocalypses that were published, first in Jewish circles and later the early Christian Church within the period from about 200 A.C.

to 200 A.D. While most of these works were probably quite popular and circulated widely, only two, the book of Daniel in the Old Testament and the Revelation of John in the New, became canonical. The chief characteristics common to all apocalyptic works are (1) the communication of the inspired information to the seer by means of visions, or dreams, or similar ecstatic experiences by which the seer was brought into immediate contact with transcendental scenes (heaven, the throne of God, angels, etc.); (2) the use of symbolism (numbers, beasts, the sea, mountains, etc., figuratively representing individuals, kingdoms and other realities); and (3) the attempt to forecast the course of world-history from the time of the author to the "end"; in other words, to work out a program of the future and especially of the last times, which were usually thought to be very near at hand. All of the known Jewish Apocalypses were pseudepigraphic, the revelations being asserted to have been received by Enoch, or Noah, or other ancient worthies, thereby giving the work the prestige belonging to great antiquity and to a famous name. Even the Daniel Apocalypse, written about 165 A.C., was assigned to a Daniel supposed to have been living about 400 years earlier. The Christian apocalyptists were not all bound by this traditional practice. At least two, John, the author of the New Testament book, and Hermas, the author of 'The Shepherd' (c. 150 A.D.), issued their works under their own names. It is evident, from the facts stated, that Revelation is unlike any other New Testament book and must be viewed and interpreted, in general, in harmony with the principles of interpretation that hold for all the works of the class to which it belongs.

Special Character of the Book.—Revelation, though one of many Apocalypses, is the most individual of them all. Its many special characteristics serve to put it in a class by itself. It is addressed by the author, John, to a definite group of seven churches, all in the Roman Province of Asia. No other Apocalypse is so openly and specifically addressed to actual readers. It was expected that it would be read and its message heeded. The circumstances which occasioned the message are, in part at least, also clearly indicated. The churches were in danger. From without, because they were undergoing persecution. Some Christians had already been martyred and a general persecution seemed imminent. Within, the sins of apostasy, immorality or corruption of doctrine seemed to be assuming threatening proportions. But it was not simply with such concrete facts that Revelation sought to deal. The seer was given to know what lay behind or was involved in these things. The persecution of the Christians was, to him, more than merely the work of the civil authorities, or of the state (the imperial Roman government). It was, in the last analysis, the work of Satan, the arch-enemy of God and of all good, the Anti-Christ, the head of legions of evil angels, whose earth rule was carried on through the institutions political and religious, of the pagan Roman Empire. Of these institutions, the one that was more significantly than any other gave expression to the union between Satan and the empire was that of the worship of the emperor.

the seer this was, in principle, the worship of Satan, it was Satan's means of receiving the homage of mankind. But just as in the institutions and practices of pagan imperial Rome Satan's earthly kingdom was concretely embodied, so in the Church—the unity spiritually existing in the numerous small Christian communities of Asia and elsewhere—nothing less than the Kingdom of God and of His Christ was concretely embodied, and the issue, as thus perceived by the seer, was in reality the issue between Satan and God, between heaven and hell, good and evil. What was transpiring on earth was therefore of universal, cosmic and eternal significance. This theme, one common to apocalyptic literature, is applied and developed in Revelation with a consistency and clarity, a dignity and sublimity, a force and pathos that places this book far above all others of its class.

The Plan of Revelation.—The book consists of two unequal parts: (1) The letters to the Seven Churches of Asia (i, 3; iii, 22); (2) The Apocalypse proper (iv–xxii). The first three verses serve as a brief explanatory introduction to the whole book, indicating the source and authority of the contents which are expressly stated to be a "revelation" and a "word of prophecy" concerning things which must soon take place.

The letters are nominally from John to the seven churches. In reality they claim to be a message from the eternal God, the "seven spirits before His throne" and from Jesus Christ, the head of the Church, who is soon about to come again (i, 3–8). John describes his vision of Jesus who commanded him to write (i, 9–20) and then gives in detail the message to each of the seven churches (chs. ii and iii). From these messages, with their particular references to the circumstances of each church, we learn what the conditions were that suggested the great Apocalyptic drama that follows.

The Apocalypse proper (iv–xxii) opens with a vision of God on His throne, with His heavenly court, ineffably glorious, worshipping and adoring Him (ch. iv), holding in His right hand a seven-sealed book (the book of destiny) which the Lamb (the crucified and glorified Jesus) alone is able to unseal. To the Lamb the whole heavenly court ascribe all praise (ch. v). The dramatic action of the Apocalypse begins with the opening of the seven-sealed book of destiny, seal by seal (ch. vi). Between the unsealing of the sixth and seventh seals there is a pause, full of meaning (ch. vii). The breaking of the seventh seal introduces a second series of signals, seven trumpet-blasts (ch. viii), each blast being followed by some event of ominous portent. The fifth and sixth trumpet-blasts also usher in the first and second of three great woes destined to come upon mankind (ch. ix). Then comes another significant pause. A little book (of prophecy?) is given the seer by an angel and the seer devours it (ch. x), after which he measures the Temple, except the outer court, which is to be given over to the Gentiles, and is told of the two witnesses and their fate and the calamities that are to follow it, making up the second woe (xi, 1–14). The blast of the seventh trumpet brings the great announcement

"the Kingdom of Christ has come to pass," at which heaven rings with praise (xi, 15–19). From now on the theme centres about the great judgment-crisis in its various stages. First, however, we are let into the secret of the great issues at stake. Such is the real significance of chs. xii–xiv. It was necessary to explain this before describing the great judgment. The seer sees a woman about to bear a son, which a great dragon is waiting to kill as soon as born. But the child is caught up to God and saved. The dragon pursues the woman but she escapes. War ensues in heaven and the dragon and his hosts are defeated and cast down to earth. The real victory has been won, but the dragon continues the conflict on earth (ch. xii). The two beasts of ch. xiii are the dragon's agents on earth by whom he seeks to keep control of mankind. But he is opposed by the Lamb, head of the armies of heaven, whose impending triumph is forecast in announcements of angels (xiv, 1–20). Now come the seven last plagues poured out by seven angels from seven bowls full of the wrath of God and culminating in the great judgment on "Babylon" (xv–xviii). These are fittingly introduced by a hymn of the victors over the beast (xv, 1–4), then described in detail (xv, 5–xvi, 21), the climax being reached when the great harlot, the earthly representative of the kingdom of Satan, the deadly enemy and persecutor of the Church, is utterly destroyed (xvii–xviii). The final acts of the great drama now take place. Of these, the supremely significant one is "the marriage of the Lamb," as is indicated in the announcement in xix, 1–10. But preceding this a final disposition must be made of the beast and the dragon, who are overthrown and at last, after a 1,000-year interval, subject to eternal punishment (xix, 11–xx, 15). Then appear the new heaven and the new earth, the marriage of the Lamb takes place and the new type of existence begins (xxi, 1–xxii, 5). The conclusion (xxii, 6–21) repeats in fuller form the urgent appeal and solemn warning of the introductory section of the book.

The Unity of Revelation.—The development of the theme is, on the whole, so consistent and straightforward that the book must be considered the work of one mastermind. The general uniformity in style throughout the book leads to the same conclusion. But the author was not the creator of the entire material of the book. He drew heavily on the Old Testament, especially on Ezekiel, Zechariah, and, above all, Daniel. He used these as quarries whence to get stones for his new building. But never is he a mere imitator or slavish copyist. He probably had access to other Apocalyptic material, symbolism, calculations, etc., which is no longer extant. In using all this variety it is not surprising that he should have found some of it difficult to manage and work up in perfect agreement with his general plan.

The Symbolism of Revelation.—Much of the symbolism used by the author was common to Apocalyptic tradition and some of it may have belonged originally to ancient Babylonian or Persian mythology and superstition without our author being aware of the fact. He took what was at hand and filled it with a new meaning or gave it a new application. The

Christian element in the symbolism of Revelation is probably for the most part due to the author. The more important symbols of chs. xii, xiii and xvii are to be interpreted as follows: the woman of xii, 1, is probably the true Israel and the child the Christian Church, the offspring of God's own covenant-people, inclusive perhaps of the Messiah Himself (ch. xii, 5). The beast ascending from the sea (xiii, 1) signifies imperial Rome, the seven heads the seven first emperors (beginning with Augustus), the one apparently wounded to death being Nero, the first emperor to persecute the Christians. The "names of blasphemy" refer to the state-religion which culminated in the worship of the emperor. The second beast (xiii, 11ff.) probably represents the organized emperor-cultus, with its priesthoods, to which the Christians were summoned to show allegiance or suffer death. Nero is meant in xiii, 18 by the number 666 (the numerical value of the Hebrew letters spelling *Nero Cæsar*). In ch. xvii imperial Rome is the great harlot. In verse 10 we again have the seven first emperors (as in xiii, 1-3). The beast of verse 11, which "was and is not" yet is himself the eighth, is the same as the wounded head of xiii, 3, namely, Nero, whom legend asserted was destined to reappear and regain control of the empire. In these three chapters, xii, xiii and xvii, the author is apparently making use of material that originally referred to the period of the sixth and seventh emperors (Vespasian, 68-79 A.D. and Titus, 79-81 A.D.), making it do service for the time of Domitian (81-96 A.D.), the eighth emperor, who laid great insistence on the emperor-worship and who made Christianity a crime punishable by death. In this emperor the author saw *Nero-redivivus*, revived as by Satanic power and therefore representing in himself and his government the rule of Satan on earth.

The Interpretation of Revelation.—Revelation was a tract for its times and is to be interpreted as such. Its message, as its address, its local color and reference to contemporary events and issues show conclusively, was for its own age. This was the way in which it was probably understood at first, but it soon (as early as Irenæus) was taken to be a prophecy in which the whole future course of the history of the world or of the Church was intended to be sketched. The author thought the end was to come *quickly*. He had no idea of a course of Christian history extending over 20 or more centuries. Consequently all attempts, too many to be enumerated, to find the events of this or any other age, past or future, foretold in Revelation are futile and doomed to failure.

Date and Author.—The earliest Christian tradition (e.g., Irenæus, V. 30, 3) asserts that John had his vision near the close of Domitian's reign, i.e., not long before 96 A.D. With this the internal evidence of the book agrees. The expectation of Nero's reappearance (xiii, 3; xvii, 8, 11) and the persecution of the Church together point to the latter part of Domitian's reign and to no other time. Sections that imply an earlier date must be considered as older material used by the author but not entirely transformed. As to the author, criticism has gotten very little beyond the simple statements

of the book itself. A certain John, a man prominent in Christian circles in Asia, who felt that his words would carry weight, sent forth this book as a message of comfort, exhortation and warning, to stay and cheer the Church in its trial, to encourage it to endure even unto death, confident that the ultimate victory of Christ its Lord would soon be manifest. Whether this John was an Apostle or was the author of the Fourth Gospel, or the "Elder" of 2d and 3d John are questions which cannot be discussed in this article but will be found fully treated in the literature listed below.

Bibliography.—Of modern commentaries, those by Bousset (Meyer series, 6th ed., 1906); Swete, H. B. (London 1909) and Moffatt (in 'Expositor's Greek Testament,' New York 1910), will be found most satisfactory, with full bibliographies. A good brief commentary is that by C. A. Scott ('New Century Bible'). W. M. Ramsey's 'The Letters to the Seven Churches' (London 1904) is full of archaeological information. The 'New Testaments Introductions,' by Zahn (New York 1909) and Moffatt (New York 1915) should be consulted.

EDWARD E. NOURSE,

Professor of Biblical Theology, Hartford Theological Seminary.

REVELGANJ, or **GODNA**, India, in Bengal, near the confluence of the Ganges with the Ghagra, has an active local trade. It is famous as the home of Gautama, the founder of Buddhism, who also taught here. Pop. 14,750.

REVELL, re-vël, Fleming Hewitt, American publisher: b. Chicago, 11 Dec. 1849. He was educated in the public schools and established himself as a publisher and editor in 1869. He founded the Fleming H. Revel Company, of which he has been president since 1890. He is a trustee of the New York Life Insurance Company, the Northfield, Mass., Seminary and of Wheaton, Ill., College.

REVELS, Master of the, an English court officer, in former times appointed to superintend the revels or amusements, consisting of dancing, masking, etc., in the courts of princes, the inns of court, and noblemen's houses, during the 12 Christmas holidays.

REVELSTOKE, rêv'ël-stôk, Canada, city and county-seat in the Kootenay district, British Columbia, 270 miles northeast of Vancouver, on the Canadian Pacific Railway, and near the Selkirk Mountains. It is situated in a mining district and has railway shops, a lumber industry and manufactures beer and cigars. Pop. 3,017.

REVENTLOW, rê-vënt-lô, Ernst, Count, German journalist: b. Husum, 1869. He attained the rank of captain in the German navy and afterward engaged in journalism. He was an ardent supporter of Germany's schemes for world dominion which culminated in the European War, and as an editorial writer on the *Deutsche Tageszeitung* advocated extreme ruthlessness, particularly in submarine warfare. He accused United States Ambassador Gerard of being a British spy; but assailed Zimmerman for the plot to form an alliance between Mexico and Japan against the United States. He furiously attacked Germany's leaders for a supposed inclination to yield to the United

States' demands for respect of its rights after the sinking of the *Lusitania*, and the *Tageszeitung* was suspended 25 June 1915. For an attack on Bethmann-Hollweg, accusing him of misleading von Hindenburg, he was sued for slander in 1916. Author of 'Russische-Japanische Krieg' (3 vols. 1904-06); 'Deutschland in der Welt voran' (1905); 'England der feind' (1914); 'Flotte in diesem grossen Kriege' (1915); 'Deutschlands auswärtige Politik, 1888-1914' (1916); 'The Vampire [England] of the Continent' (1916), etc.

REVENUE, the income of a nation, derived from taxation in various forms. In England the principal source of revenue is the income tax. In the United States the national government derives its revenue chiefly from tariff duties and internal taxes on alcoholic liquors and tobacco. The revenues of the various States and municipalities are mainly from taxes on land and buildings and personal property. New York and some other States have an inheritance tax which brings in large returns, so that the New York State government is supported almost without direct taxation. So far as the large majority of citizens are concerned, the forms of taxation in the United States are not directly appreciable. In some countries of Europe, revenue is collected by most vexatious methods. In Vienna a small tax is exacted every time the resident of an apartment house goes in or out of the building between 10 P.M. and 6 A.M., the person in charge of the building being the collector, and responsible to the authorities. Methods hardly less annoying are practised in other European cities. The "octroi," a tax on produce of any kind brought into a city from the country districts, is prevalent throughout Europe, and adds to the cost of all kinds of food.

REVENUE CUTTER, a small armed steam vessel, designed for the prevention of smuggling; so called from the fact that originally the vessel was of the cutter-yacht type. The United States Revenue Cutter Service is a branch of the Treasury Department and its purpose is, principally, to enforce the customs revenue laws. Its immediate supervision resides in a bureau of the department known as the Division of Revenue Cutter Service, which is in charge of a chief and a number of assistants.

REVENUE CUTTER SERVICE, United States. The organization of this service in 1790 was the conception of the first Secretary of the Treasury under the Constitution, Alexander Hamilton. In emphasizing its importance Hamilton recommended "giving the officers military or naval rank, which will not only induce fit men to engage, but attach them to their duties with a nicer sense of honor." The original purpose was to inaugurate a "preventive service," as against illicit trade by sea, and in that sense to aid the customs service in the collection of the revenue from duties on imports. The organic act provided for ten small vessels, armed and equipped, and for each a complement of officers and enlisted men, and these formed the nucleus from which has grown the service of to-day. From the beginning the service was placed upon the same plane as to pay and allowances for its officers

and enlisted men, with the officers and soldiers of the army.

Various acts of Congress (1 Oct. 1790, 2 March 1793, 6 March 1796, 1 July 1797) provided for additional and larger vessels, increase of crews, armaments and equipments. It is interesting to note that this service was the only semblance of a navy possessed by our government from 1790 to 1797, when on 10 July, in the latter year, the first vessel of the then new navy, the 44-gun frigate *United States*, was launched. In the meantime the duties of the service were such as were required of an armed service, in guarding the coast and commercial interests, and also against piratical incursions. But during those years our relations with France were becoming strained, culminating finally in active hostilities at sea between vessels of the United States and of France. The difficulties with France may be said to have been the first war of the young republic with a foreign power. During its continuance (1798 to 1801) several engagements were fought and many captures were made by our vessels.

The revenue cutter service took an active and brilliant part in co-operation with the navy. Thus, while this service was organized as a preventive service to be operated in the interest of commerce and for the protection of the revenue, it had, in these early years, rapidly developed into an armed and equipped military or naval service, offensive and defensive, and this character was well and continuously maintained.

At the breaking out of hostilities with France provision for an armed force upon the sea, to convoy merchantmen and to defend the coast, became indispensable. To accomplish these purposes the President was authorized (Act 1 July 1797) to increase the complements of the several revenue cutters, and to employ them in defensive operations on the coast. Under authority of previous enactments the service had been provided with a number of vessels which, for that time, were of considerable size and able sea-going qualities. In 1798 two brigs and six schooners were commissioned, aggregating 1,140 tons, carrying 96 guns and 416 men.

When it was determined, in 1798, to extend hostile operations against France, to the waters of the West Indies, four fleets, under Commodores Barry, Truxton, Tingey and Decatur, United States navy, comprising in all some 20 national vessels, were formed to prey upon French commerce and destroy that nation's privateers, the above-named vessels of the revenue cutter service were placed in co-operation with the navy and sailed with the fleets, and in the summer and fall of 1799 did fine service. It was during this war that the frigate *Constellation*, under Commodore Truxton, captured the French frigates *Insurgent*, 40 guns, and *Vengeance*, 44 guns. During the naval operations against France 22 vessels, privateer and other, under the French flag, were captured, and of these 16 were made prizes by the revenue cutters, unaided, while they assisted in the capture of two others.

The Slave Trade.—Under the provisions of law inhibiting the slave trade, between the United States and foreign countries, the revenue cutter service, in common with the navy, took

an active part in its suppression, and in the course of its work captured many slavers and liberated an aggregate of 487 negroes.

The War of 1812.—For the enforcement of the embargo laws of 1807, Congress by the Act of 6 Jan. 1809, and another enactment of the same date, made provision for additions to the fleet of revenue cutters of 42 vessels. Following the proclamation of the President ordering all British armed vessels to leave the ports of the United States, and laying the first embargo in December 1807, to the close of the War of 1812, which ensued, the service bore an honorable and conspicuous part. Numerous and varied duties in the enforcement of the embargo laws up to the date of their repeal, and subsequently the non-intercourse act, fell to the revenue cutter service until the declaration of war, 4 June 1812, when the service entered upon an active career, to capture, burn, sink and destroy the commerce of the enemy in co-operation with the navy. The first prize in that war was the British trading schooner *Patriot*, with a valuable cargo, and was captured by the revenue cutter *Jefferson*, Capt. William Ham, 25 June 1812, just 21 days after the declaration of war. Following this the cutters *Madison* and *Gallatin* made valuable prizes. The British privateer *Dart*, 14 guns, had been for some time cruising and committing depredations on our coast near Newport, R. I. On 4 Oct. 1813, the revenue cutter *Vigilant*, Capt. John Cahoon, having augmented his crew by a draft of some 20 men from the United States frigate *President*, Commodore John Rogers commanding, sailed from Newport in pursuit. Soon after coming up with the enemy he captured the vessel by boarding and conveyed the prize and prisoners to Newport. One of the most notable actions fought upon the water in the War of 1812 took place in York River, near Chesapeake Bay, on the night of 12 June 1813, when the cutter *Surveyor*, commanded by Capt. William Travis, succumbed after a desperate resistance to superior forces from the British man-of-war *Narcissus*.

During this war the revenue cutter service captured 10 merchantmen, three barges, three officers and 60 men; one privateer mounting 14 guns. The cutters *Eagle*, *Mercury* and *Active* did duty as scouts and on blockade service. The cutters *Commodore Barry*, *Surveyor* and *Eagle* were captured by the enemy, but only after hard struggles and most gallant defenses.

Neutrality Laws.—The enforcement of the neutrality laws, during the European troubles from 1815 to 1823, engaged much of the attention of the service, but this duty has always been a part of the vigilant work of the service, and is no less true of the earlier years than in the operations of later times.

Nullification, 1832.—During the attempt to nullify the laws relating to the collection of revenue from imposts, by the State of South Carolina, five vessels of the revenue cutter service were ordered to Charleston Harbor, with instructions "to take possession of any vessel arriving from a foreign port, and defend her against any attempt to dispossess the customs officers of her custody until all the requirements of the law had been complied with." The silent influence exerted by the presence of this fleet

was a large factor in the solution of the difficulties which menaced peace.

Piracy.—During the early years of the last century, piracy which prevailed along the Gulf Coast of our possessions acquired from France and Spain, was suppressed, chiefly by the revenue cutter service. That service waged relentless war upon the corsairs, pursued them into every bay and bayou, broke up their resorts and rendezvous, attacked and dispersed them whenever found. While engaged in this work the cutters *Louisiana* and *Alabama* were attacked off the south coast of Florida by the pirate *Bravo*, commanded by Jean La Farge, a lieutenant of the notorious Jean Lafitte. The *Bravo* was signally defeated, and carried by boarding in a hand-to-hand struggle. The rendezvous of the pirates on Breton's Island, La., was attacked by the cutters *Alabama*, Captain Cartigan, and *Louisiana*, Captain Loomis, and the resort broken up. This practically put an end to organized piracy on our Gulf Coast, though piratical craft from Mexico, Central America and South America, subsequently made incursions on that coast. The pirate *Bolivia* with its prizes *Antoinette* and *Isabella* were found by the cutter *Louisiana*, Captain Jackson, at the South West Pass of the Mississippi River. Jackson attacked at once, captured the *Bolivia* and liberated the prizes, and carried his prisoners to New Orleans. The *Bolivia* carried three guns and 34 men; the cutter *Louisiana* two guns and 16 men.

Seminole War, 1836-42.—During the Florida War for the suppression of Indian troubles in that region, the revenue cutters *Dallas*, *Washington*, *Dexter*, *Jefferson*, *Jackson*, *Madison*, *Campbell* and *Van Buren* rendered valuable and conspicuous service in Florida waters, co-operating principally with the army.

The Mexican War, 1845-47.—The revenue cutter service was represented in this war by the following named cutters: Schooners *Forward*, *Ewing*, *Van Buren*, *Wolcott*, *Woodbury*, *Morris*, and steamers *McLane*, *Legare*, *Spencer*, *Bibb* and *Polk*. They took an active part principally in co-operation with the armies under Scott and Taylor. Some of these vessels, notably the *Forward* and *McLane*, served in co-operation with the navy, in the fleet commanded by Commodore Conner. In the squadron of Commodore M. C. Perry, at the capture of *Frontera* and *Tabasco*, the *Forward* took a brilliant part.

Paraguay Expedition.—In the naval expedition to Paraguay, in 1858, the steam revenue cutter *Harriet Lane*, seven guns, eight officers and 104 men, served in co-operation with the navy, and rendered valuable services.

Winter Cruising.—The Act of Congress, approved 22 Dec. 1837, now embodied in section 1536, Revised Statutes, requires that a suitable number of public vessels shall cruise upon the coast in the severe portion of the winter weather to afford aid to distressed navigators. The work outlined in the law, now undertaken by the coast guard and always effectively performed by the revenue cutter service, is energetically maintained. As a result of the work many hundreds of lives and many million dollars' worth of property have been saved. Vessels of commerce are frequently fallen in with at sea, with sails blown away, crews frost-

bitten and unable to respond to duty; they are taken in tow and to a harbor; others short of provisions and water are supplied, while others again, found stranded, are floated when possible. In short, everything possible is done for the relief and care of the distressed mariner of whatever nationality wherever found, during the hard weather on our storm-driven coast from December to April, and prompt response is always made by the service at the cry of distress at all seasons and all hours.

Life-Saving Service.—This, an outgrowth of the revenue cutter service, formed part of the division of revenue cutter service prior to its organization as a separate service under the act approved 18 June 1878. On 28 Jan. 1915, the two services were again fused.

In the Civil War, 1861-65.—The service was conspicuous and valuable throughout this period from the attempted relief of Sumter in April 1861 to the close of hostilities in 1865. The *Harriet Lane* co-operated with the navy at the capture of the fortifications at Hatteras Inlet; the *Forward* rendered support and assistance to General Butler at Annapolis, Md.; the *Miami* covered the landing of troops at Lynn Haven Bay for the recapture of Norfolk; the cutter *Naugatuck* took part in the attack on Sewell's Point, led the naval fleet up the James River and participated in the bombardment of Drewry's Bluff, 15 May 1862; the *Nemaha* rendered efficient aid to the army and navy on the South Atlantic Coast, received on board General Sherman at Fort McAllister, Savannah, Georgia, at the end of his "march to the sea," and conveyed him to the naval fleet below. The *Forward*, *Brown*, *Agassiz*, *Toucy* and *Antietam* rendered important service in the waters of North Carolina, while the *Jackson*, *Hercules*, *Reliance*, *Tiger* and *Allen* performed excellent service in the Chesapeake, co-operating with the naval forces in the gunboat flotilla in those waters.

In Peace from 1867 to 1898.—The achievements of the service were numerous and varied during times of peace, and honorable, often heroic in both peace and war. It blazed the way to and through Alaska, and for many years from the date of the acquisition of that territory in 1867, except for the occasional visit of a naval vessel, was the only service to exercise authority or to display the national emblem in the waters of that coast from Sitka to Bering Sea, and the Arctic Ocean to Point Barrow. It is on guard in the waters of Alaska from early in May until late in December of every year, rendering aid to shipping, caring for the shipwrecked, and assisting to their homes the unfortunate and the destitute. Its surgeons yearly prescribed for and as far as possible aid the sick, and hardly a year goes by in which more than a thousand cases are not treated or relieved by the medical officers of our cutters in Alaskan waters. In these waters alone the service has rescued and brought home from the Arctic Circle hundreds of shipwrecked whalers, and others, who, but for the timely aid of the service, must have perished.

In the Spanish-American War, 1898.—Hardly had the war commenced when the revenue steamer *McCulloch*, bound for San Francisco, was overhauled at Singapore, by cable, directing her to report at Hongkong to

Commodore Dewey, commanding the Asiatic fleet. The ship made a quick run to Hongkong, joined Dewey, and accompanied him in his Manila campaign, performed fine service, and brought to a waiting world the first news wired from Hongkong of the victory of Manila Bay. That ship, the *McCulloch*, remained with Dewey until November following, and incurred the very highest praise on his part.

At the battle of Cardenas, 11 May, the revenue cutter *Hudson*, Lieut. Frank H. Newcomb, R.C.S., commanding, sustained the fight against the gunboats and shore batteries of the enemy, side by side with the naval torpedo-boat *Winslow* and when Ensign Bagley and half the crew of the latter-named vessel had been killed and her commander wounded, rescued from certain destruction the vessel and the balance of the crew, under the furious fire of the enemy's guns.

President McKinley made the work of the *McCulloch* and *Hudson* the subject of a special message to Congress, in terms of high commendation and praise and as a reward of merit in the case of Hodgson of the *McCulloch* (there being no higher grade in the revenue cutter service to which he could be promoted) that he be retired from active service on the full pay of his grade and in recognition of the heroic gallantry noted in the letter of the Secretary of the Navy, the bestowal of a gold medal of honor upon Lieutenant Newcomb, of the *Hudson*, and silver medals of honor to each of his officers and bronze medals to each of his crew. It will be noted that the only gold and silver medals bestowed by Congress for services in this war were those for officers of the revenue cutter service. There were in co-operation with the navy during this war, 13 revenue cutters carrying 61 guns, 98 officers and 562 enlisted men. Of these eight cutters (43 guns), 58 officers and 339 men were in Rear-Admiral Sampson's fleet and on the Havana blockade. One cutter, 6 guns, 10 officers and 95 men in Dewey's fleet and 4 cutters, 12 guns, 30 officers and 128 men co-operated with the navy on the Pacific Coast. Three other cutters, with 25 officers and 210 men, were ordered into co-operation, but the war closed before they were equipped or could get to the front. There were in active co-operation with the army and navy together in all 20 cutters, carrying 71 guns, 131 officers and 725 men. The services performed by the vessels of the revenue cutter service in co-operation with the navy during this war were officially acknowledged by the commanders of the fleets with which they served.

On 28 Jan. 1915 the revenue cutter and life-saving services were merged into the coast guard. See COAST GUARD; LIFE SAVING SERVICE, THE UNITED STATES.

REVERBERATORY FURNACE, a furnace in which the material is heated without coming into contact with the fuel. Between the fireplace and the bed on which the material to be heated lies a low partition wall, called a firebridge, is placed. The flame passes over this bridge and plays down against the bed, being reflected or reverberated (whence the name) by a flat arch which surmounts the whole.

REVERE, *rĕ-vĕr'*, Joseph Warren, American military officer: b. Boston, Mass., 17 May 1812; d. Hoboken, N. J., 20 April 1880. He entered the navy as midshipman in 1828, attained the rank of lieutenant in 1841, served in the Mexican War, and in 1850 resigned from the navy. At the outbreak of the Civil War he was appointed colonel of volunteers in the army and in 1862 was promoted brigadier-general. He commanded a brigade at Fredericksburg and was engaged at Chancellorsville. For his conduct in the latter battle he was censured by his superior officer, tried by court-martial, and dismissed from the service in 1863. The decision was revoked by President Lincoln and Revere then resigned. He published 'Keel and Saddle' (1872).

REVERE (French, RIVOIRE), Paul, American patriot: b. Boston, Mass., 1 Jan. 1735; d. there, 10 May 1818. He was trained as a gold- and silver-smith and was skilful in the engraving of designs for silver plate. In 1756 he participated in the expedition for the capture of Crown Point, upon his return from which he set up as a goldsmith and also practised copper-plate engraving. Among his prints were a likeness of Samuel Adams, a portrait of King Philip, a view of Castle William and the Boston Massacre. He also engraved the plates for the earliest paper currency of Massachusetts. In 1774 he was one of the grand jurors who refused to serve in consequence of the act of Parliament making Supreme Court justices independent of the legislature as regards salary. In the autumn of that year he became one of the "thirty Northend mechanics," who patrolled the Boston streets to watch the movements of the British forces. On 14 April 1775 this committee of observation noted preparations in barracks and on board ship on the part of the British. On the evening of the 18th it was seen that troops were marching across the common to the inner bay. Revere forthwith had a preconcerted signal set in a Northend church tower—the honor being claimed for Christ Church and for the church in North Square destroyed by the British—crossed the river, mounted a horse on the Charlestown side and began his famous "midnight ride." He was none too early, for at 2.30 A.M., 800 British troops were landed at Lechmere Point and marched on Lexington. Revere became the trusted special messenger of the committee of safety and after the evacuation of Boston was made successively major and lieutenant-colonel of a regiment of artillery. He took part in the Penobscot expedition in 1779. After the Revolution he resumed as gold- and silver-smith, built a bell- and cannon-foundry and in 1801 established large copper-rolling works at Canton, Mass. It is said that he was the first in America to smelt copper ore and to refine and roll copper into sheets and bolts. He was conspicuously associated with benevolent enterprises. Longfellow's poem, 'The Midnight Ride of Paul Revere,' in which, says Winsor, the author has "paid little attention to exactness of fact," is well known.

REVERE, Mass., city in Suffolk County, on the Atlantic Coast and on the Boston and Maine Railroad, northeast of Boston. The place was settled in 1627 and was first named Rumney Marsh. Until 1738 it was a part of Boston.

In 1739 it was incorporated as Chelsea and in 1846 was set off and reincorporated as North Chelsea. In 1871 the name was changed to Revere, in honor of Paul Revere (q.v.). It received its city charter in 1915. It is a popular residential town and summer resort. It has a Massachusetts State Bath House, built and maintained by the State; Revere City Hall, a memorial to Paul Revere, and a Carnegie library. It has a number of churches and good public schools. It has a city government controlled by a mayor and nine councilmen. Pop. 25,187.

REVEREND, a title of respect given to ministers of religion—in the United States to the clergymen of all religious denominations, including the Jewish Church: the titles very reverend, right reverend and most reverend are given to deans and vicars-general, bishops and archbishops, respectively. A like usage prevails in England, but strict churchmen of the Establishment long refused to accord the title reverend to the clergymen of the dissenting churches. When the bishop of Lincoln in 1874 refused to allow this title to be inscribed on the tombstone of a Wesleyan minister, his action was approved by judgments of the Arches Court; but that judgment was reversed on appeal to the Privy Council, when the title was declared to be simply one of courtesy and not confined to clergymen of the Established Church. In Scotland the principals of the universities, if they be clergymen and the moderator of the general assembly for the time being, are styled very reverend.

REVERIES OF A BACHELOR, or **A BOOK OF THE HEART**, a collection of meditative papers by Donald Grant Mitchell, originally issued under the pseudonym, 'Ik Marvel.' The first 'Reverie' was published in the *Southern Literary Messenger* in 1849, and reprinted the following year in *Harper's New Monthly Magazine*. These papers, full of sentiment, enjoyed a wide popularity at the time of their appearance and still find favor with readers.

REVERSION, in biology, the reappearance in an animal or plant of characteristics not of its parent, but of more remote ancestors. This frequently occurs in varieties of domesticated animals or of cultivated plants, which have been produced by artificial breeding and which suddenly develop traits belonging to the wild stock. The more highly bred and artificial the variety of animal or plant, the more liable is it to show this occasional reversion. That the tendency is strong and persistent appears from the fact that if the variety is not kept pure by careful breeding, as when a flower escapes from cultivation or a race of domestic animals runs wild, it soon begins to resume the characteristics of, or "revert toward," the wild stock from which it sprang. This reappearance of abnormal characters, as of color, markings; etc., is very likely to occur in the progeny resulting from the crossing of dissimilar races or species, which can be explained only on the supposition that such characters belonged to remote ancestors, perhaps thousands of generations removed. This was illustrated very forcibly by the experiments undertaken at Penycuik, in Wales, by Ewart, in the crossing of zebras with mares, the offspring of which exhibited many pe-

cularities belonging to neither parent. Consult Darwin, 'Variation of Animals and Plants Under Domestication' (London 1888); Ewart, 'The Penicuik Experiments' (London 1899); and the authorities cited under HEREDITY.

REVERSION, in law, the right to property which remains after some particular estate has ceased which has been granted by the owner. In the United States this is virtually the only meaning of the term in general usage. In England, where the purchase and holding of annuities is common, a reversion means the present right to a payment to be made at some future time, conditional upon certain contingencies, as in the case of an insurance failing to be paid on the attainment of a certain age, or on the death of the assured. The value of a reversion is easily ascertained when the date of its emergence is fixed, and thus a person who has a right to receive a certain sum of money at a given time is enabled to sell this right for its just value. See PROPERTY.

In heredity, reversion is the reappearance in offspring of ancestral feature or type. Atavism is nearly synonymous, but properly more restricted, referring to the return of characters observed in less remote ancestors, of the human race especially. Reversion is sometimes seen in cultivated plants, exhibiting features of the wild plant. Domestic animals do not always return to the feral form and color, when they run wild, but in many instances or in some degree they do. Pigs have resumed stripes and other characteristics of the wild boar. Black is supposed to be the original color of sheep to which some in almost every flock return, despite most careful exclusion for many generations. The crossing of breeds sometimes reproduces at once the original type, as in the case of pigeons and white and black fowls; the former was followed by offspring like the wild blue rock pigeon; the latter became red like the original jungle-cock of India. In plants there is often a partial morphological reversion, as when stamens are reconverted into petals, or petals into leaves. See HYBRIDITY; MENDEL'S LAW, and consult Darwin, C., 'Variation of Animals and Plants under Domestication' (2 vols., New York 1900), and Ewart, J. C., 'The Penicuik Experiments' (London, 1899).

REVIEWS. See PERIODICAL LITERATURE.

RÉVILLE, rà-vêl, Albert, French Protestant theologian: b. Dieppe, France, 4 Nov. 1826; d. 1906. He was educated at Geneva and Strassburg, and was pastor of the Walloon Church at Rotterdam, 1851-72. He then removed to Dieppe, where he spent his time in philosophical studies till called in 1880 to the chair of the history of religions in the Collège de France. He was one of the most radical French Protestants of his time, and among his numerous books are 'Comparative History of Philosophy and Religion' (1859); 'Redemption' (1860); 'Essais de Critique religieuse' (1860); 'Theodore Parker, sa Vie et ses Œuvres' (1865); 'History of the Dogma of the Divinity of Jesus Christ' (1869); 'Introduction to the History of Religions' (1881); 'Histoire des Religions' (1883-89).

REVISED STATUTES OF THE UNITED STATES, a compilation of all the

acts of the Congress of the United States; it was first approved by Congress 22 June 1874, thus becoming law; at that time the compilation included all the laws enacted by Congress down to 1 Dec. 1873. The second edition of the Revised Statutes comprised the first edition, as amended by the 43d and 44th Congresses; supplements have since been approved and published containing later acts of Congress. The act approving the Revised Statutes makes that compilation the authentic and authoritative expression of the laws, without reference to the original acts, but the originals may be quoted to show the true intent of the lawmakers if there is any ambiguity in the compilation.

REVISED VERSION, a revision of the authorized version (or King James' version) of the Bible. The project of the revision originated in the Convocation of Canterbury, 1870, when two companies of biblical scholars of the Established Church, one to revise the Old Testament, the other the New, were appointed, with power "to invite the co-operation of any eminent for scholarship, to whatever nation or religious body they may belong." Afterward, under a resolution of the Convocation, two companies of American biblical scholars were formed, to act with the English companies. The work of revision, which was commenced 30 June 1870, was completed 20 June 1884; the New Testament was published in England and the United States in May 1881, and the Old Testament in May 1885. Many readings and renderings proposed by the American revisers were not approved by the English companies either for adoption into the text or the margin, but were ordered to be recorded at the end of the New Testament or the Old, respectively. But an edition of the whole Bible having the renderings preferred by the American companies and many other renderings since proposed by American scholars has been published in the United States and is known as the American Revision. See BIBLE.

REVIVAL OF LETTERS, a term used to designate the revival of literature after the apparent death blow which it received when the barbarous nations of the North destroyed the Roman empire. It commenced about the beginning of the 11th century, and became more potent in the 14th, 15th and subsequent centuries.

REVIVAL OF RELIGION, a season of religious awakening out of spiritual torpor or indifference; usually brought about by the fervid exhortations of men deeply impressed with the feeling that the churches, the pastors and the people have been slumbering while Satan has been gaining possession of the kingdom of Christ on earth. The term, revival of religion, is a modern one, but the thing it signifies is as old as Christianity, as old as Israelitism or as religion itself. The mission of every one of the Hebrew prophets was for the revival of religion; in the Christian Church, revivals, though not called by that name, occurred at intervals from apostolic times; and every sincere and enthusiastic reformer—Saint Peter Damiani, Saint Francis of Assisi, Saint Dominic, in the Middle Ages; the Jesuits, the Redemptorists and other missionary orders; these were in their time revivalists in fact,

though not in name. The Reformation is regarded by Protestants as a great awakening of the Christian consciousness and the well-spring of all the efforts that have since been made for the renovation of the spiritual life in the Protestant churches. In England, at the beginning of the 17th century the religion of the Established Church had degenerated into a cold but decent formalism, but a revival of spiritual interest in the common people was brought about through the instrumentality of the Puritans. After the restoration of the monarchy and of the State church there was a period of spiritual sloth and apathy, infidelity and immorality till in the 18th century Great Britain was aroused by the fervid preaching of the Wesleys, Whitefield, Rowland Hill, Romaine, Venn, Newton, Cecil, Fletcher and others, earnest men who were raised up and qualified by the divine spirit for the work which lay before them. (See *METHODIST CHURCHES OF THE WORLD*). In the colony of Massachusetts Jonathan Edwards carried on notable revivals at Northampton in 1734. Shortly afterward Gilbert Tennant aroused great religious interest in New Jersey. The impulse spread through the colonies, and has been called the Great Awakening; it seems to have arisen independently of the movement in the parent country; but it was greatly quickened by the missionary labors of John Wesley and George Whitefield during their visits to the colonies. Its influence was very powerful during the years 1740, 1741 and 1742, and its quickening results were felt long afterward, and inspired the multiplication of churches, seminaries and colleges. About the same time there was a remarkable revival of religion in various parts of Scotland, especially at Cambuslang and Kilsyth; and out of a similar awakening in Wales arose the Welsh Calvinistic Methodist Church. In 1839 Kilsyth was again the focus of a great revival of religion, which extended to Dundee, Perth, Blairgowrie, An-crum, Jedburgh, Kelso, and in the north of Scotland to Ross-shire and Sutherlandshire. In the first half of the 19th century there were many revivals in the United States, notable among which were those under Charles G. Finney (q.v.), who also visited Great Britain and preached to vast crowds in London and other cities; a notable feature of the great revival commenced in 1830 was the camp meetings (q.v.), assemblies of great numbers of people, held in the open air and addressed by relays of evangelists from morning till night. In 1858 there was a great revival of religion in the United States, which subsequently extended to the British isles and even to the continent of Europe. Its principal centres at first were New York and Philadelphia, whence it spread throughout the States, producing for a time a sort of federation of the evangelical churches for the promotion of the work of spiritual conversion. In nearly every city in the land meetings for prayer were held daily, often in business hours, in churches, in counting houses, in theatres and other places of public resort; in the one State of New York more than 2,000 cities, towns or villages had an active part in this revival; throughout the country the interest in the movement was universal; daily reports of the deep religious feeling of the people

were received at the principal centres and published in the newspapers. In New York every evangelical church received large accessions to its membership, and a like report was made concerning Boston, Baltimore, Washington, Chicago, Cincinnati, Pittsburgh and other cities. For nearly two years the meetings for prayer and the labors of the evangelists continued almost unflagging, and for many years noon-hour prayer-meetings continued to be held in the business centres of many of the cities. In the summer of 1859 the movement extended to the north of Ireland, where it was not less fruitful of spiritual good than in America; the people flocked to the services in the open-air meetings or assembled in social gatherings for devotional exercises; there was a noticeable diminution of vice and immorality, especially of drunkenness; and judges and magistrates cordially recognized the reality and power of the spiritual work. From Ireland the revival spread to Scotland, and in Glasgow, Edinburgh, Aberdeen, Perth, Dundee, and the other considerable towns, the religious denominations joined in active exertions to bring the neglected poor within the range of evangelistic and educational agencies. It extended to Wales also, where in one year the increase in the membership of the Calvinistic Methodist body alone was 33,724 souls; the gain to the independent denomination was 30,000, to the Established Church 20,000 and to the Wesleyan body 10,000. In more recent times the great revival in Wales of 1904-06 was conspicuous for its great wave of moral regeneration in certain districts. In the West and Southern United States and rural districts of the East the revival often took the form of the camp meeting (q.v.), and these open air gatherings continue to be made an instrument of evangelism and conversion by the Methodist Church. Out of the camp meeting sprang the Chautauqua Assembly (q.v.), an institution both religious and educational. Especially notable was the revival initiated in Chicago by Dwight Lyman Moody (q.v.) and conducted by him in conjunction with Ira D. Sankey. These two evangelists—a preacher and a singer of the gospel—visited Great Britain in 1873, and for two years in the principal cities of England, Scotland and Ireland their meetings were attended by multitudes from all ranks of society, and their labors zealously seconded by ministers of all the evangelical churches; thousands of persons professed conversion, and there was a manifest religious awakening. The two evangelists on their return home engaged in revival work of the same kind in the American cities; and they subsequently made two visits to Great Britain, namely, 1883-84 and 1891-92. The Salvation Army (q.v.) and the Volunteers of America (q.v.) are agencies designed to promote a continuous revival of religion, especially among the poor and neglected classes.

Among modern American revivalists and professional evangelists are "Gypsy" Smith, J. Wilbur Chapman, "Sam" Jones, R. A. Torrey, and most prominent of all "Billy" Sunday, an ex-baseball player who, though lacking in the elegancies of speech, possesses an energy of statement, a seemingly boundless enthusiasm and an ability for drawing and holding an audience that is phenomenal. He is the mos

conspicuously successful revivalist since Moody.

REVOCATION OF THE EDICT OF NANTES. See **EDICT OF NANTES**.

REVOLUTION, a term commonly used to designate a fundamental change in government, or in the political constitution of a country, effected or sought to be effected by violence and force of arms of a considerable number of individuals, and mainly brought about by internal causes; a revolt against the constituted authority more or less successfully and completely accomplished. In the United States the term Revolution is applied specifically to the American War for Independence, which began in 1775 with the irregular running fight popularly known as the battle of Lexington, and practically ended with the surrender of Lord Cornwallis, at Yorktown, Va., to the combined forces of the French and Americans, 19 Oct. 1781. By this war the colonies succeeded in casting off the English authority and in erecting the government of the United States. The English revolution was that revolution in England by which James II was driven from the throne in 1688. The Central American states and Mexico have been seriously afflicted for years with revolutions. See **MEXICO**; **CENTRAL AMERICA**; also **POLAND**; **REBELLION**; **UNITED STATES** — **AMERICAN REVOLUTION**.

The French Revolution began in 1789. (See **FRANCE**). Others were: Sweden, 1772; Holland, 1795; Netherlands, 1830; Spain, 1868 and 1874; Brazil, 1889; Chile, 1891; Cuba, 1891-98; Norway, 1905; Turkey, 1908; Mexico, 1910; China, 1912.

REVOLUTION. (1) *In astronomy*, the motion of a planet around the sun or of a satellite around a planet. The point to which it returns is called annual, anomalistic, nodical, sidereal or tropical, according as it has a relation to the year, the anomaly, the nodes, the stars or the tropics. (2) *In geometry*, when one line moves about a straight line, called the axis, in such a manner that every point of the moving line generates a circumference of a circle, whose plane is perpendicular to the axis, that motion is called revolution, and the surface is called the surface of

revolution. Every plane through the axis is called a meridian plane, and the section which this plane cuts from the surface is called a meridian curve. Every surface of revolution can be generated by revolving one of its meridian curves about the axis. The revolution of an ellipse round its axis generates an ellipsoid; the revolution of a semi-circle round the diameter generates a sphere; such solids are called solids of revolution. (3) *In mechanics*, the motion of a rotating body around a centre, as that of a small gear-wheel traveling around a large gear-wheel — distinguished from rotation.

REVOLUTIONARY CALENDAR, a calendar adopted during the French Reign of Terror. It was decreed on 24 Nov. 1793, to commence from the foundation of the French republic, 22 Sept. 1792. The 12 months were Vendémiaire, Brumaire, Frimaire, Nivose, Pluviose, Ventose, Germinal, Floreal, Prairial, Messidor, Fervidor or Thermidor, and Fructidor. The first three constituted autumn, the second three winter, the third spring and the fourth three summer. Napoleon I restored the old system 31 Dec. 1805.

REVOLUTIONARY TRIBUNAL. A court of extraordinary criminal jurisdiction established by the French Convention, 10 March 1793, for the purpose of trying those accused of plotting "against the liberty, equality, unity and indivisibility of the Republic, the internal and external safety of the state, or the sovereignty of the people." It received the name Revolutionary Tribunal in October 1793. The court was to consist of a jury and a public prosecutor with two assistants, all named by the Convention, and from its decision there was no appeal. The number of judges rose as high as 80 toward the end of the tribunal's existence. Intended as a means of combating treason at home, the Revolutionary Tribunal speedily became an instrument in the hands of the Committee of Public Safety, whose will it executed under the guise of judicial form. Without any definite procedure, with no legal defenders allowed to the accused and with its acceptance of the vaguest rumors and charges as evidence, the tribunal offered but a mockery of justice and citation before it almost invariably meant death. The reading of the act of accusations, the trial and the execution of the sentence generally occurred on the same day. The tribunal sent 1,220 victims to the guillotine from its inception till June 1794, when Robespierre (q.v.) caused the infamous law to be enacted accelerating its procedure; from that date to the fall of Robespierre, a period of about 50 days, it condemned 1,376 persons, Robespierre and his followers being among the lot. The tribunal soon after ceased its functions and was formally suppressed 31 May 1795. Its sanguinary work must be regarded as justified to a large extent by its success in saving the country from sedition at home at a time of great national danger. It was but one feature of the organized Terror which saved France from foreign conquest. Consult Wallon, 'Histoire du Tribunal Révolutionnaire de Paris' (1880-82).

REVOLUTIONARY WAR. See **UNITED STATES** — **AMERICAN REVOLUTION**.

REWA, rā'wā, India, (1) the capital of a native state of the same name, 131 miles south-

west of Allahabad, and connected by a branch line with Sutna on the East India Railway. It is enclosed by three wall circuits or ramparts, the outer one massive and flanked by round towers. Its chief buildings and institutions are the fortified palace of the maharajah, a high school, hospitals and a model jail. Pop. 24,000.

(2) The native state in the Central India Agency and in the subagency of Baghelkhand (q.v.), has an area of 12,676 square miles. It is chiefly an elevated tableland, but also comprises portions of the country on both sides of the Kaimor Hills, watered by the Son, a tributary to the Ganges, and flowing northeast. The surface is in part covered with jungle, but on the whole highly cultivated; the condition of the peasantry is, however, much depressed. The ruins of many temples are scattered over the country. The revenue of the maharajah amounts to about \$1,250,000 annually; the armed force consists usually of 4,000 men, though from 10,000 to 12,000 might be mustered. Pop. about 1,700,000.

REWA KANTHA, kân'tū or -tā, India, a political agency under the government of Bombay, containing 61 small states, of which five are tributary to the British government, and most of the remainder to Baroda. The territory included, covering an area of 4,980 square miles, with a pop. of about 478,889, lies mainly along the south bank of the lower Nerbudda with patches north of it, and on the western borders of Broach, Baroda and Ahmadabad.

REWARD, in a legal sense, some encouragement which the law holds out for exertions in bringing certain classes of criminals to justice. The courts may order the sheriff of the county, in which certain offenses have been committed, to pay to persons who have been active in securing the apprehension of offenders charged with murder or with feloniously shooting, cutting, stabbing, wounding or poisoning, or with rape, burglary, housebreaking, robbery, arson or cattle-stealing, or with being accessory before the fact to any of such offenses, or to receiving any stolen property, a reasonable sum to compensate them for expense, exertion and loss of time. By another statute it is a felony, punishable by penal servitude to the extent of seven years, to corruptly take any reward for helping a person to property stolen or embezzled, unless all due diligence to bring the offenders to trial has been used. States, cities, municipalities, corporations, individuals, etc., may offer rewards for information leading to the detection and punishment of any sort of crime, and this is done not infrequently to induce some one having knowledge of a crime to disclose it, receiving protection as regards any complicity of his own. In Great Britain an advertisement offering a reward for the return of stolen or lost property, using words purporting that no questions will be asked or inquiry made after the person producing the property, renders the advertiser, printer and publisher liable to forfeit £250; but in the United States such advertisements are common. Some courts have held that a reward may be withdrawn by advertisement; also that it lapses after a reasonable time.

REWBELL, rê-bél, Jean François, French statesman: b. Colmar, 8 Oct. 1747; d. there, 23

Nov. 1807. He was a prominent advocate of Colmar, and was elected to the States-General of 1789, where he advocated the principles of the Revolution. He was a member of the Constituent Assembly, where his boldness and legal knowledge made him president in 1791. As a member of the Convention, in 1792 he was outspoken in urging the condemnation of Louis XVI; but his absence on a mission to the army at Mentz saved him from being numbered among the regicides. He helped suppress the Jacobin Club in 1794, figured as member of the committees of public safety and of general security; and on the adoption of the Constitution in 1795 he became one of the five members of the Directory and took in charge the departments of Finance, Justice and Foreign Affairs. In 1796 the Directory elected him its president. He succeeded in defending himself from conviction on charges of peculation, but retired from public life after the *coup d'état* of the 18th Brumaire (9 Nov. 1799) and carried with him a large fortune. Consult Sciout, 'Le Directoire' (1895-97).

REXFORD, Eben Eugene, American writer: b. Johnsburg, N. Y., 16 July 1848. He was educated at Lawrence University, Appleton, Wis., and began to write for the press at 14. He published 'Brother and Lover,' verse (1886); 'Grandmother's Garden,' verse (1887); John Fielding and His Enemy' (1888); 'The Swamp Secret' (1897); 'Flowers: How to Grow Them' (1898); 'Into the Light' (1899), etc., and achieved popular fame as author of the well-known songs, 'Silver Threads Among the Gold' and 'Only a Pansy Blossom.'

REYES, Rafael, Colombian explorer soldier and statesman: b. Santa Rosa de Viterbo, Boyoca, 1852. He served as Minister of the Interior under President Núñez, was Minister to France and Switzerland and delegate to the second Pan-American Conference in Mexico. In 1904 he was elected President of Colombia. He greatly improved the internal affairs of the republic. He resigned in 1910. Beside the public service rendered by him when he traveled during several years in unknown parts of the Amazon Basin, the facts in his career which deserve special notice are the following: He was commander-in-chief of the Colombian army; was sent to Washington, after Colombia had lost Panamá, to 'save whatever he could from the wreck'; and in this patriotic effort he was certainly not altogether unsuccessful, since he gained courage to advocate on his return to Bogotá the policy indicated in the report which he submitted to his government. He advocated, sensibly, courageously and magnanimously, a frank acknowledgment by his people of their own blundering which had contributed to the disaster; and he continued to show his people how the natural resources of the vast territory still remaining in their possession could be developed by attracting foreign capital. He succeeded. The very great imperfectly defined powers of the Presidency were entrusted to him, despite the old ultra Conservatives' hostility to foreign enterprise, and despite the suicidal scheme of the Liberals for permitting Colombia to be absorbed by Venezuela and Ecuador. His success saved Colombia from a future of isolation and stagnation, on the one hand, or, on the

other hand, nearly complete loss of identity. President Amador of Panamá and President Reyes exchanged congratulatory messages in August, and the American Minister was received at Bogotá in December 1904. Dr. Reyes is the author of 'Misión del Rafael Reyes' (1908); 'Pro Colombia, Pro Ibero-América' (1912); 'The Two Americas' (1914).

REYKJAVIK, rík'yá"vík. See REIKIAVIK.

REYMONT, Wladyslaw Stanislaw, Polish novelist and poet: b. 6 May 1863. The son of poor parents, he received but little education and, after trying his hand in various employments—on the railway, on a farm, in a store and on the stage, he began his literary career in 1894. Though practically unknown to the English-speaking world, his novels, of which he has written over 20 volumes, have found their way into Russian, French, German, Swedish and Spanish. His first story of 'Death' (1894); his first novel 'The Comedienne,' appeared in 1896. These were followed by 'Fermentation' (2 vols.); 'The Promised Land' (2 vols.); 'The Peasants' (4 vols.); 'The Vampire'; 'The Dreamer' and a trilogy portraying the partition of Poland and the insurrection led by Kosciuszko in 1794. W. Reymont visited the United States in 1919.

REYNARD (rá'nérđ) **THE FOX**. The beast-epic, 'Reynard the Fox,' the property of the Frankish race of the Netherlands, northern France and western Germany, is perhaps their most original contribution to mediæval literature. To be sure, there is scarcely a people without its animal fables, which in the case of celebrated stories like some of Æsop's go back to remote antiquity, but none has developed a consistent epic such as the Middle-Franconian, Reinaert de Vos. A short poem in Latin composed at the court of Karl the Great in the 8th century by Paulus Diaconus, retells the Æsopian fable of the sick lion, who on the advice of the fox is cured by being wrapped in a fresh wolf's hide. The same story is found in the 'Ecclasiastic captivi,' or 'The Escape of the Calf,' in which a Lorraine monk from Saint Evre at Toul relates the story of his escape from the cloister, under the cloak of an animal story, about 940. Other elements from Æsop, Phædrus, the Physiologus and folk-stories were gradually added to the kernel, including human names for the animals, and the Flemish Magister Nivardus of Ghent added 11 other humorous animal stories, including the pilgrimage of Bertiliana, the Goat, with satirical attacks on the vices of the clergy, in a Latin poem of over 6,000 verses, the 'Isengrimus,' between 1146-48. Bishop Gaudri of Laon had called his enemy Isengrimus as early as 1112, on the testimony of Petrus Alfonsus in his 'Disciplina clericalis.'

The beasts apparently received their Teutonic names in Flanders, so Reynard, from a root ragin + hard = strong in counsel; Isengrim, either iron helm, or iron fury; Tibeert, the cat, from Theudebert, a Frankish king; Bruun = brown, the bear. Others like the Leopard Feirepeel, from varium pellem, spotted hide, are French.

French.—From this time on the gleemen or traveling entertainers take up the subject and include the court and all ranks of people in their satire, with the result that poets, good and

bad, develop a never ending Roman de Renart in French, which is artistically arranged by an unknown editor in some 27 "branches" of more than 40,000 lines, including repetitions and variations. Ernest Martin thinks that perhaps nine of these "branches" were collected by 1180, that a few years later, perhaps at the beginning of the 13th century Pierre de Saint Cloud added "branche" 16 to complete the poem, thus rekindling a waning interest to which was due among others "branche" 20, completed around about 1210 and the foundation of the Flemish epic. Other "branches" were added in the 13th century by the editors from whose labors resulted two broad classes of manuscripts, numbering 15 in all. A lost compilation of 16 "branches" was adapted about 1180 by the German Heinrich der Glichezare. Later continuations of the 13th and 14th centuries were 'Le couronnement Renart,' 'Renart le nouveau' and 'Renart le conterfait.' cf. Rothe, M.A., 'Les Romans du Renard' (Paris 1845).

Of the personality of the poets we know nothing. We can only judge from their dialects, from the use of Flemish words, from place names, and scattered historical allusions that they came from either the Flemish and German border or the Isle de France. The older the composition the greater its merit. The later branches became more and more anthropomorphic, less "beastly," and degenerated into fastidious allegory, the didactic purpose of which became fatally tiresome, and the poem gradually sank into oblivion.

Originally based on the friendship of wolf and fox, this relation changed to hostility and resulted in a series of duels between fox and wolf or the latter's retainers and champions, in which the cunning of the fox invariably worsts the heavier ferocity of his adversary. An especial favorite was the 'Judgment of Reynard,' with which Martin's edition begins. Hens, titmice, kites, crows, hares, Tibeert the cat, Patous the bear, the ram, the heron, all suffer or are killed. Reynard even becomes emperor, violates the female wolf and seduces the queen, who is at all times his friend, cures King Nobel, the lion, at the expense of the wolf. Finally he dies, or at least is supposed to die, receives a grand funeral (of which there was formerly a sculpture in the cathedral of Strassburg, representing Reynard on a stretcher carried by the other animals), and goes to the animals "paradise," "two leagues beyond paradise." To compliment Boniface VIII, Philip the Fair had the subject matter of this procession played in the streets of Paris about 1303.

Text: Méon, M. D. M. (4 vols. with supplement. Frontispiece by Desenne. In Newberry Library, Chicago; Paris 1826); Ernest Martin (Strasbourg et Paris 1887). (The best; Branche I = Méon's Branche XX). **Criticism**: Sudre, L., 'Les sources du Roman de Renart' (Paris 1892); also in *Petit de Julleville's* 'Histoire de la langue et de la littérature française,' (II Paris 1896); Martin, Ernest, in *Zeitschrift für germanische und romanische Philologie*, 1894; Paris, Gaston, 'Le Roman de Renard' (*Journal des Savants*, Paris 1895); Potvin, 'Roman du Renard' (Paris 1891). **Translation**: Potvin, 'Roman du Renard mis en vers' (Paris-Bruxelles 1861).

Middle High German.—Only a few fragments of the Reinhart Fuchs of Heinrich der Glichezare (the Satirist) have come down to us, but a 13th century redaction was edited by J. Grimm in 1834. This poem represents Reinhart in the beginning as the dupe of weaker animals, later as victimizing the wolf in various pranks, working up to the illness of the king, to the trial of Reinhart, to his curing of the king at the expense of his opponents and his final poisoning of his benefactor.

The author seems to have been an errant minstrel or gleeman of whom nothing is known. His style is terse, dry and satirical, with proverbs and local allusions, and German names for animals. He seems to have used a French compilation, containing a portion of the extant Renart but with four episodes of which the French originals have not yet been found.

Text: 'Reinhart Fuchs' (Reissenberger, Halle 1886).

Flemish.—Between 1250 and 1270 an unknown poet wrote the 3,476 lines called 'van den vos Reinaerde' (of Reynard the Fox). He may have been a "clerk," Willem, perhaps from Hulsterlo in East Flanders, or possibly an unknown Arnout from Brügge or thereabouts. From the 1st (Martin) branche of the French Roman he derives his poem with logical consistency and epic purpose. It opens with the court of King Nobel, the lion, to whom complaints against the thief and murderer Reinhart are preferred, and bear and later cat are sent to summon the culprit, who gets both into terrible trouble. On the advice of the badger, his "nephew," he submits, goes to court, defends himself and offers to go on a pilgrimage to Rome. Acquitted by the king he breaks all promises, commits further depredations and is outlawed. It is told naively, humorously and well. Only a portion of the names are Flemish, the rest French.

Nearly a century later another unknown, possibly from Brügge, rewrote 'Willem's' work, and added some 3,318 lines with copious borrowings from the Roman de Renart, the Flemish adaptation of Marie de France's 'Isopet,' and various Bestiaries. Its satirical and obviously didactic purpose made it a great favorite for several centuries, as is witnessed by the chap books of Gouda, 1479, Delft, 1485, the Caxton English one of 1481, and the rimed and modernized Antwerp work of 1487, of which last only fragments are preserved because the Duke of Alba and the University of Louvain caused all copies to be destroyed in the year 1570. It was accompanied by didactic glosses and preceded by a preface from the pen of an unknown Hinrek van Alckmer, who was long wrongly considered the author of the Low German 'Reinke de Vos,' which contains a translation, or more likely an adaptation, of the preface to an Antwerp print of 1564.

Text: 'Reinaert' (Ernest Martin, Paderborn 1874); 'Reinaert' (F. Buitenrust Hettema en J. W. Muller, Zwolle 1903); 'Reinaert' (van Helten, Groningen 1891). *Edition* (MS.): Hermann Degering (Münster 1910).

Low German.—The first version appeared at Lübeck in 1498 with the so-called Catholic "glosses," followed by the Rostock edition of 1539 with polemical Protestant "glosses," from which resulted 14 Low German, 2 high German, 7 Latin, 3 Danish, 1 Swedish translation,

down to Gottsched's reprint and prose translation of 1752, which is the beginning of modern "Reinhart" scholarship and the main basis of Goethe's 'Reinecke Fuchs.'

Reinke (ke is a diminutive) Vos is the principal literary monument of Middle Low German literature, but it has added little to the Flemish original. It has perhaps improved it by slightly amplifying certain portions, while condensing others, by eliminating some of the sermonizing so that a certain refreshing naïveté distinguishes it at least from Reinaert II, and its influence in Germany is deeper and broader than elsewhere. The 16th century engravings of Virgil Solis and Jost Ammann also contributed to this popularity.

Text: 'Reinke de Vos' (Friedrich Prien, Halle 1887). *Criticism:* Th. Carlyle, 'German Literature of the 14th and 15th Centuries' (*Foreign Quarterly Review*, 1831).

High German.—Gottsched's translation in 1752 of the Lübeck version of 1498, illustrated with Everdingen's fine engravings, was read in extract by Goethe to Duchess Amalie in 1782, and the acquisition of "this profane bible" in 1783 "makes him happy as a child," but it was his disgust at the failure of the campaign to rescue Louis XVI in 1793 that caused him to write: "But I endeavored to rescue myself from this hideous misfortune by declaring the whole world infamous . . . it was now (in 'Reinke Vos') really amusing to see court and ruler intrigues mirrored. For even if the human race appeared quite natural in its undisguised bestiality, things went off amusingly, if not perfectly." Goethe's work adds practically nothing to the original except his own political confession in the eighth canto. He divided the poem into 12 cantos and adopted the dactylic hexameter in place of the rime verses of four accents of the 'Reinke.' Goethe's version gave rise to Wm. Kaulbach's inimitable drawings, the delight of older generations.

Text: Gottsched, J. C., 'Reinecke Fuchs' (1752, and Halle 1886); Goethe's 'Werke' (1794, Vol. II); 'Reinecke Fuchs' (Munich 1847; with Kaulbach's woodcuts; tr. into English by T. J. Arnold); Simrock, K. J., 'Reinecke Fuchs' (Frankfurt 1845, original metre); Soltau, 'Reinecke Fuchs' (Berlin 1803, original metre).

English.—'Vox and the Wolf' (13th century), Chaucer's 'Nonne Preestes Tale,' and Caxton's translation (1481) of the Gouda reprint of 1479, popularized the tale in England. In 1844 W. J. Thoms edited the last for the Percy Society. In 1895 appeared Joseph Jacobs' 'The Most Delectable History of Reynard the Fox,' with a valuable introduction. In 1852, E. W. Holloway published in Leipzig 'Reynard the Fox,' translated from the German of Simrock mainly, illustrated by the fine woodcuts of H. Leutermann. T. J. Arnold translated from Goethe with illustrations by J. Wolf (1855); same with illustrations by W. von Kaulbach (1860).

CARL E. EGGERT,
Sometime Assistant Professor of German, University of Michigan.

REYNOLDS, rēn'oldz, Edwin, American engineer: b. Mansfield, Conn., 23 March 1831; d. 1909. He was apprenticed to a machinist in

1847 and in 1857-61 he was superintendent for Stedman and Company at Aurora, Ind. He was superintendent of the Corliss Steam Engine Company, Providence, R. I., in 1871-77, and was afterward connected with the Edward P. Allis Company, Milwaukee, Wis. He invented the Reynolds-Corliss engine, introduced the first triple expansion pumping engine, and the cross compound hoisting engines for mining work.

REYNOLDS, James Emerson, Irish chemist: b. Booterstown, County Dublin, 1844. He took the degrees M.D. and Sc.D. at the University of Dublin, and in 1867 was appointed keeper of minerals at the National Museum at Dublin. He was professor of analytical chemistry at the Royal Dublin Society in 1870, and in 1873 became professor of chemistry at the Royal College of Surgeons, Ireland. In 1873-1903 he was professor of chemistry and chemical philosophy at Dublin University. He was president of the Society of British Chemical Industry in 1891; of the Chemical Society, London, in 1902-03, and vice-president of the Royal Society in 1902. He discovered many chemical substances, including thiocarbamide and its allies; a new class of colloids, and several groups of the element silicon, which he described in reports in the 'Transactions' of the Chemical Society and the Royal Society. Author of 'Lectures on Experimental Chemistry' (1874); 'General Experimental Chemistry' (1880).

REYNOLDS, Joseph Jones, American military officer: b. Flemingsburg, Ky., 4 Jan. 1822; d. Washington, D. C., 25 Feb. 1899. He was graduated from West Point in 1843 and after service at Fort Monroe and in Texas was, in 1846, assigned to the Third artillery and was on frontier duty at Fort Washita, I. T., in 1855-56. He then resigned to become professor of mechanics and engineering at Washington University, Saint Louis. At the beginning of the Civil War he entered the Federal army as colonel of the 10th Indiana Volunteers, soon becoming major-general of volunteers. He was engaged in the battles of Chickamauga and Chattanooga; later was in command of the defenses of New Orleans from 6 January to 16 June 1864; and of the Mississippi River from its mouth to Memphis, Tenn., from October to December 1864. In 1866 he was mustered out of the volunteer service and promoted colonel in the regular army. He was brevetted brigadier-general in 1867, retiring from active service in June 1877.

REYNOLDS, Sir Joshua, English portrait painter: b. Plymouth, Devonshire, 16 July 1723; d. London, 23 Feb. 1792. He was the son of Rev. Samuel Reynolds, master of the grammar school at Plympton Saint Mary, Plymouth, who intended him for the medical profession; but Reynolds declared himself for art and went to London in 1741 and studied under Thomas Hudson. This painter was at the head of his profession at a time when there were no very shining lights and from him Reynolds acquired a correctness of drawing and a certain reflection of the style of Van Dyck that gave way subsequently, in great measure, to other influences. He returned to Devonshire after two years and painted portraits for small prices; went again to London in 1745 and established himself as a painter, but the death of his father

the following year recalled him to Plymouth. In 1749 he accompanied young Commodore Keppel, then sent on a mission to the Barbary states, to the Mediterranean and spent more than three years in Italy, mainly at Rome with visits to Florence, Bologna, Parma, Venice and a short stay at Paris on his return to London. In Italy, he studied the Italian masters, especially in respect to their handling of light and shade. He learned from the Venetians much of their mastery of color, so that when he settled again in London in 1753 his work showed the influence of Correggio primarily with reminiscences of Tintoretto, Veronese and Titian. In that year he painted a portrait of Commodore Keppel that lifted him at once into fame. This picture, now in the Grosvenor Gallery, is almost a monochrome in gray, with a few faint suggestions of color; but is remarkable for its effects of light and for individuality of portraiture. So popular did the young painter become that in 1755 120 persons sat to him for their portraits. His work, which is of such considerable extent, does not display a uniform excellence, since to produce it all he had to call in the assistance of journeymen. In 1768 he was made president of the Royal Academy upon its establishment; and the next year he delivered his first discourse to the students. His social success was commensurate with his fame as an artist; George III knighted him and appointed him court painter in succession to Allan Ramsay. He lived on terms of intimacy with Dr. Johnson, Goldsmith, Burke, Gibbon, Garrick and was the founder of the Literary Club in 1764 where these distinguished men assembled. His body lay in state in the Royal Academy and he was buried in Saint Paul's Cathedral.

The mention of his portraits would include all the names famous in the upper world of society and the arts in his day, and there is no higher source for learning of the beauty of English women, the character of English men and the fashions of taste of the later 18th century. He was graceful in arrangement of figures and accessories, was able in his portraits of men and women to differentiate a masculine vigor and a feminine charm, and in his mastery of color achieved a position, according to Ruskin, as "one of the seven great colorists" of the world. Posterity cannot fully appreciate his power in the latter direction, as he often used impermanent mediums and resorted to a thick impasto, which has cracked with time. His work is amply represented in the National Gallery and the National Portrait Gallery of London and the numerous great collections belonging to noble families. In America his pictures are to be found in fewer numbers in the larger museums and in the possession of private collectors. He published 'Discourses Before the Royal Academy' (1778), and 'Commentary on Du Fresnoy's Art of Painting.'

REYNOLDS, William, American naval officer: b. Lancaster, Pa., 18 Dec. 1815; d. Washington, D. C., 5 Nov. 1879. He entered the navy as midshipman in 1831, was commissioned lieutenant in 1841 and in 1851 was retired in consequence of failing health. He was subsequently assigned to duty in Hawaii where he negotiated a reciprocity treaty, and at the outbreak of the Civil War was again assigned to active duty. In 1862 he received command of the Asiatic station, was promoted captain in 1866, commodore in 1870 and rear-admiral in 1873. He was chief of bureau and acting Secretary of the Navy in 1873 and again in 1874; and in 1877 was again retired on account of continued ill health.

REYNOLDSVILLE, rēn'öldz-vīl, Pa., borough in Jefferson County, 75 miles direct and 120 miles by rail northeast of Pittsburgh on the Pennsylvania, the Reynoldsville and Falls Creek and the Michigan Southern railroads. It has bituminous coal mines and an extensive lumber industry, and has flour, silk and woolen mills, a tannery and manufactures macaroni and asbestos. The borough was increased considerably in size by the annexation of several neighboring areas in 1913, including West Reynoldsville with its population of 993. Pop. about 3,189.

REZONVILLE, rē-zōn-vēl, Battle of. See GRAVELOITTE; FRANCO-GERMAN WAR.

RHABDOCCELIDA, rāb-dō-sē'li-dā, an order of *Turbellaria* which is characterized by the simple, unbranched and rod-shaped alimentary canal. Some forms are very minute and often mistaken for *Infusoria*. Transverse fission is common in certain forms, and the power of regenerating lost parts is very great. A few genera have acquired a strictly parasitic habit, and a few also are marine and land forms, but most are inhabitants of fresh water. In many species two sorts of eggs are produced: summer eggs which are thin-shelled and are retained in the uterus until hatched, and winter eggs, which possess heavy brown shells, and, though produced in the fall, do not hatch out until spring. All *Rhabdoccelida* undergo a simple direct development.

RHABDOMANCY. See DIVINATION; DIVINING ROD.

RHADAMANTHUS, rād-a-mān'thūs, according to Greek legend, a son of Zeus and Europa, and brother of Minos, king of Crete. According to another tradition, Rhadamanthus laid the foundation of the Cretan code of laws, which his brother Minos completed. From fear of his brother he is said to have fled to Ocaleia in Boeotia, where he married Alcmene. In the belief of the Greeks a spirit in the lower world continued the business of life, hence Rhadamanthus, after his death, was made a judge in the kingdom of Pluto, or the Islands of Blessed, on account of the justice of his life, and had

for his associates Æacus and Minos. The name suggests an Egyptian origin of the myth.

RHÆTIA, rē'shī-ā, a Roman province comprising the regions of Rhætia proper and Vindelicia and extending from the land of the Helvetii in Gaul to Noricum on the west, and from Gallia Cisalpina to the Danube. It included within its bounds what are now the Grisons and the Tyrol, the southern districts of Bavaria and Württemberg and the region of the Italian Alps, and contained the sources of the Rhine (Rhenus), the Inn (Alnus) and the Adige (Athesis), with many other rivers of northern Italy. The principal towns were Tridentum (Trent) in Rhætia proper and Augusta Vindelicorum (Augsburg) in Vindelicia. The original inhabitants of the country were considered by most ancient writers to be Etruscans who had been driven out of Italy by the invasion of the Gauls and who under their leader Rhætus took possession of the mountainous country. Modern research has tended to confirm the view of the ancients. The Rhætians were a brave and warlike people and their frequent inroads into northern Italy led to retaliation on the part of the Romans. After a bitter struggle they were subdued in 15 B.C. by Drusus and Tiberius, stepsons of Augustus Cæsar. With Vindelicia, which was conquered at this time, the southern region was united to form the province of Rhætia. Diocletian divided the province into two, giving to the southern part the name of Rhætia Prima, while Vindelicia was known as Rhætia Secunda. After passing into the power of the Ostrogoths in the 5th century the region was overrun by the Boiarii who settled in the eastern part, the Alemanni who occupied the west and the Longobards who established themselves in the south.

RHAMNACEÆ, ram-na' se-æ, an order of trees and shrubs. The species, of which about 500 have been described and classified in about 40 genera, are mostly natives of temperate and tropical countries, in which they are widely distributed, especially in the northern hemisphere. They are frequently spiny, have usually simple leaves and inconspicuous, small, greenish blossoms which are followed either by dry fruits which break at maturity into three parts, or by fleshy ones which do not split open when ripe. In several species the fruit is edible as in the jujube (*Zizyphus jujuba*). The red fleshy pear-flavored peduncles of *Hovenia dulcis* are eaten in Japan and China, where the plant is native. Some are important ornamental plants; for instance buckthorn (*Rhamnus*), and New Jersey tea (*Ceanothus*). Various species of the former genus are valued for the yellow and green dyes they yield and *R. frangula* for its charcoal which is used in making gunpowder.

RHAMPSINITUS, rāmp-sī-nī'tūs, a Græcised form of the Egyptian name Rameses, Rameses III, the first king of the 20th dynasty and the builder of the pavilion of Medinet Habu at Thebes. Brugsch makes Rhampsinitos a Greek form of *Ramessu pa nuter* ("Rameses the God"); Maspero, *Ramsis-si-nit* ("Rameses, son of Neith"); by Diodorus he was called Remphis (Rempsis), from which comes the name Rameses by which Pliny called the monarch. Of him Herodotus (II, 121 et seq.) relates a story sub-

stantially the same as one of the most widespread folktales of the Aryan world. The king acquired an enormous treasure, and to secure it built a treasury of stone. The architect left one stone loose, so nicely adjusted as to be unnoticed, yet capable of being taken out and replaced without difficulty. Before death he entrusts the secret to his two sons, who from time to time plunder the king's treasure at their will, until at length the elder is caught in a snare set by the king. According to his desire, the younger brother cuts off and carries away his head, so that he may remain unknown. The king now orders the headless body to be exposed unburied, protected by a guard of soldiers, but the younger brother lades an ass with skins of wine, allows some of it to run out and is relieved in his distress by the soldiers, to whom in gratitude he gives his wines so freely that they all sink into a drunken sleep. Thereupon he shaves the right half of all their beards, and carries his brother's body to his mother. The king next sends his daughter to find out the clever thief. She promises her love to those who reveal to her the most extraordinary things that have ever happened to them, and when the young man in his turn relates the strange passages of his life she seizes him; but he cunningly slips his brother's dead hand into hers, and so escapes. The king is so much struck with wonder and admiration that he promises the clever thief his daughter in marriage, since he surpassed all mankind in knowledge; for, while the Egyptians surpassed all the world, he surpassed the Egyptians.

The wealth of **Rameses III** is said to have been equal to 400,000 talents, or \$387,500,000, an incredible sum for those ages. It is represented on the walls of the palace treasury in the Medinet Habu as consisting of the precious metals and of wonderful jewels.

Herodotus gives the generally accepted story of the supposed thefts from the treasury, but his chronology and historical facts have been proven to be too inaccurate to be relied upon.

RHAPSODISTS, wandering minstrels among the ancient Greeks, who sang the poems of Homer and sometimes their own compositions. They were for a long time held in high esteem, until the poems were committed to writing, and through the medium of manuscript copies became pretty generally known, when the rhapsodists soon lost their importance. Each ballad or recitation was termed a rhapsody, and thence it was applied to the separate books of the *Iliad* and *Odyssey*. Consult Browne, H., 'Homeric Study' (London 1905).

RHATANY. See RATTANY.

RHAZES, *rā'zēs* (ABU BEKR MAHAMMED IBN ZAKHARIYA AR-RAZI), Arabic physician; b. Rai or Raz (ancient Rhagae), near Teheran, probably 923 A.D. He acquired great philological and philosophical knowledge, but studied chiefly music. Eventually he became expert in the medical science of his day and was made director of the Bagdad Hospital. There is a story that, when aged, he became blind and refused to have an operation performed upon his eyes, because the surgeon about to undertake it could not tell how many membranes the eye contained. When it was urged that the operation might nevertheless succeed, he still refused, saying that he had seen so much of the

world he was weary of it. The best known of the books that pass under his name is 'Al-Havi,' but its authenticity is questioned. His treatise on the smallpox and measles is the oldest account in existence of those two diseases. It has been translated several times into Greek and Latin and into English from the Arabic text by Greenhill (1847). His 'Ketab Al-Mansuri' is a complete system of medicine drawn from Arabic and Greek sources.

RHÉ, *île de, èl dè rà*. See **RÉ, ÎLE DE**.

RHEA, *re'a*, an ancient Cretan earth-goddess, daughter of Uranus and Gæa, wife of her brother, the Titan Cronus, and by him mother of the Olympian deities Zeus, Hades, Poseidon, Hera, Hestia, Demeter. She was early identified with the Asiatic nature-goddess, Cybele, the Great Mother, who was worshipped on mountains in Mysia, Lydia and Phrygia. Her Cretan *Curetes* corresponded to the Phrygian *Corybantes*, many of whom mutilated themselves like Attis in the frenzy of their orgies. Rhea was supposed at first to make her home in the towering hills of Asia Minor. It was her delight to tame the ferocious beasts found in these wildernesses, as well as to protect the fair towns lying in their valleys. Thus she became known as Mater Turrata and was represented as wearing a crown, turreted like a wall. Rhea's supposed love for the Phrygian shepherd, Attis, gave much color to her worship. In Pessinus, in Phrygia, there was a cave under Mount Dindymon, where was a large stone supposed to be the heaven-sent image of the goddess, as well as the tomb of Attis. This was the centre of her worship and here the first temple to Rhea is said to have been erected by King Midas. From this centre the worship spread to the neighboring towns and provinces, finally reaching Athens. The worship of Rhea continued long after the decadence of Phrygian civilization. Its introduction into Rome, during the Second Punic War, was the result of a prophecy of the Sibylline Fates which told that her image brought to Rome would expel a common foe. The stone in the cave at Pessinus was, therefore, placed in the temple of Victory in the capital city, a holiday being proclaimed to celebrate the event.

RHEA, the generic and usual book-name of the South American ostriches or nandus, which, although true ratite birds and occupying the place of ostriches in the American avifauna, yet differ so greatly from the African species that ornithologists universally rank them as a distinct family (*Rheidae*) or even order (*Rheæ*). Conforming to the general type of the ostriches, the rheas differ in having three toes with large claws, the head and neck fully feathered, the flowing plumes absent from the wings and especially the tail, the ischiatic instead of the pubic bones forming the pelvic symphysis and the palatal structure peculiar in several respects. Three species of *Rhea* have been described; *R. americana*, found throughout the greater part of South America; *R. macrorhyncha*, which is confined to northeast Brazil and is distinguished by its darker color and longer bill; and *R. darwini*, of southern Argentina, which is smaller and has tarsi covered with small scales instead of scutes as have the others. The newly-hatched young of the latter are said to have the legs feathered to the toes.

Rheas are known to the natives as *nandus* or *emas* (the latter a corruption of *emu* introduced by the Portuguese) and live in small parties on the pampas and dry plains, where they associate with wild horses, deer and guanacos. In general habits they closely resemble the ostriches (q.v.), but usually run with the wings lowered instead of elevated. They are said to be able to swim across wide rivers. Because of the well-developed syrinx, which is absent in the ostriches, the male rheas have a loud, resonant call, especially heard during the mating season, when they also fight viciously. They are polygamous and the male incubates the score or more of eggs deposited by several females in one nest. They are omnivorous. Although lacking the precious plumes of the ostrich the feathers of the rhea have a commercial value in the manufacture of feather dusters. Many thousands are killed by shooting or with the bolos, or are run down with hounds or horses and clubbed to death. In many places they are threatened with extinction; but, although they breed readily in confinement, no efforts to raise rheas on a commercial scale appear to have been made. Consult Darwin, 'Voyage of the Beagle' (New York 1889); Mosenthal and Harting, 'Ostriches and Ostrich Farming' (London 1877).

RHEA, or CHINA GRASS. See RAMIE.

RHEA LETTER, The, in American history, a famous political episode of the time of the Monroe administration. On 6 Jan. 1818, Andrew Jackson, then army department commander in the Southwest, wrote to President Monroe regarding the Seminole troubles in Florida and advising the prompt seizure of East Florida, which he declared could be done "without implicating the government." He offered to accomplish the seizure himself within 60 days, if it should be indicated to him that it were desirable. John Rhea, a congressman from Tennessee, was the secret channel through which he hoped Monroe's assent might be signified. It was not. In 1831, during Jackson's administration, in the height of his quarrel with Calhoun, which turned in part upon the Seminole affair, Rhea wrote to Monroe, hoping to elicit from him something that would implicate him as approving Jackson's plan. Monroe, on his death-bed in New York, denounced Rhea's insinuations as utterly false.

RHEES, rês, (Benjamin) Rush, American Baptist clergyman and educator: b. Chicago, Ill., 8 Feb. 1860. He was graduated from Amherst College in 1883 and from the Hartford Theological Seminary in 1889. He was pastor of the Middle Street Baptist Church, Portsmouth, N. H., 1889-92, and professor of biblical New Testament interpretation (1892-1900) in the Newton Theological Institution, Newton Centre, Mass. He was elected president of the University of Rochester, Rochester, in July 1900, where he is also Burbank professor of Biblical literature. He has published 'The Life of Jesus of Nazareth: a Study' (1900); 'Saint Paul's Experience as a Factor in His Theology' (1896), also articles in journals and periodicals.

RHEIMS, rênz, Fr. râns (Reims), France, in the department of Marne, on the Vesle, 100 miles northeast of Paris. Its industries are

considerable, embracing, besides champagne, the manufacture of textiles, dyeworks, breweries, distilleries, etc. It is also an important market for raw wool, and its woollen goods, mixed fabrics in silk and wool, merinos, etc., are known in commerce as *articles de Reims*. The old ramparts have been transformed into boulevards, but a few ancient gateways remain, the most noteworthy of which is the Porte de Paris. Rheims was a well-built town and picturesque from the material employed in building and from the prevalence of the older style of architecture. The abbey of Saint Remy was one of the town's principal features; it had become a hospital before the late war. Rheims is a very ancient city. It occupies the site of Durocortorum, mentioned by Julius Cæsar as capital of the Remi, from which people it subsequently took its present name. There are extensive Gallo-Roman remains on the Montagne de Rheims to the south. Christianity may have found entrance into Rheims at an earlier period, but not till the middle of the 4th century did Rheims become a bishop's see. It became a place of importance under Frank rule and was early imbued with a religious character as the scene of the baptism of Clovis and his officers in 496 and to the many solemn and historical rites celebrated in its great cathedral. It became an archbishopric in the 8th century and after 1179, the year of the coronation there of Philip Augustus, it became the place for the coronation of the kings of France, Charles X being the last monarch solemnly crowned there. The only sovereigns, in the long series, not crowned at Rheims were Henry IV, Napoleon I and Louis XVIII. During the frenzy of the Revolution, the cathedral was attacked by the populace, and the sacred oil ampoule was destroyed, in detestation of royalty; and in 1830 the ceremony of the coronation at Rheims was abolished. The most remarkable building is the great cathedral, one of the noblest specimens of Gothic art in all the world. It was built in the first half of the 13th century; is 466 feet long by 99 feet in breadth, with a transept of 160 feet, and a height of 144 feet. Its grandest features were the west façade, which was unrivaled, and the Angel tower, which rose 59 feet above the lofty roof. The baptismal fonts were exquisite and the organ was one of the finest in France. A wealth of tapestry, sculpture and paintings beautified this magnificent structure and innumerable statues of artistic grace adorned the exterior. It is now necessary to write of its glory in the past tense for the Germans by aerial attack and long range artillery fire damaged this glorious edifice beyond repair during the four years in which they were in sight of its towers yet never able after the first fierce onslaught to come within the city. The cathedral is now nothing but a magnificent ruin. The city of Rheims was also laid in ruins by shot and shell. In normal times Rheims had a population of 118,000. See WAR IN EUROPE; and consult Gossett, Alphonse, 'La cathédrale de Reims' (Paris 1895); Justimus, J., 'Reims, la ville des sacres' (Paris 1880); Marlot, Guillaume, 'Histoire de la ville, cité et université de Reims' (3 vols., Rheims 1843-45); 'Reims and its Cathedral' (in *Contemporary Review*, Vol. CVI, New York 1914).

RHEOSTAT, in electricity, an instrument invented by Wheatstone for measuring electrical resistances. Two rollers, one non-conducting, and the other of brass, are geared together, so that when either is turned by means of a handle a fine copper wire will be uncoiled from one roller as it is wound upon the other. Two binding-screws, one of them in contact with the brass cylinder and the other with the end of the wire on the non-conducting cylinder, connect the apparatus with the wires of the battery. To use the rheostat, the resistance to be measured is put in circuit with a constant battery and a galvanometer, and the indication of the galvanometer is noted; the resistance is then removed from the circuit, and the rheostat is put in its place, and the handle turned till the galvanometer gives the same reading as before; the resistance of the rheostat is now the same as the resistance which was to be measured, and it is measured by the number of coils of copper wire on the insulating roller. At present instruments working on the same principle, and known by the same name, are used to adjust the resistance of electrical circuits.

RHEOTROPISM, that tendency in plants which leads their roots, when immersed in running water, to curve in accordance with the current. Positive rheotropism causes the roots to curve up stream; and negative rheotropism produces the opposite curvature.

RHESUS, or BENGAL MONKEY, a common Indian macaque (*Macacus rhesus*). It is a strong species with powerful limbs, but without the ruff or beard found in some allied species. The body attains a length of about two feet, and the tail is of medium length. Brown is the prevailing color, but the bare face and the callosities are flesh-colored or red. The rhesus monkey is very intelligent and mischievous, and the young ones can be easily tamed. In several parts of India the Hindus protect this species, for which they have a great veneration.

RHETORIC (Gr. *ῥητορικὴ τέχνη*, the art of the orator), the skilful use of language for the persuasion or influence of others. Out of this primary meaning of the term have grown other secondary senses. These embrace the artistic use of language, skill in discourse, the power of persuasion, the influence exercised by this power, ostentatious display of language, gaudy and tawdry use of speech, the prostitution of one's honesty and honor by the use of persuasive language employed to gain ignoble ends, artificial oratory as opposed to natural and unaffected speech. Rhetoric thus includes, in the widest use of the term, the art of orator whether written or spoken. It, therefore, includes public speaking, delivery of a discourse, speech, etc., composition, written or spoken, recitation, elocution, with special reference to the scientific rules governing all of these. The

ancient Greeks use the term rhetoric largely in the sense of the art of persuasion; and this is the more general sense in which the word is used to-day. Modern writers on the subject of rhetoric have analyzed and dissected the term and followed into all sorts of ramifications, and broadened its scope so as not only to include everything relating to the art of composition but also the investigation of the psychological problems related thereto, the effect of rhetorical speech upon hearers or readers and its reactive effect upon society. While this philosophical aspect of the question is in line with the spirit of scientific investigation of cause and effect, of the age in which we live, it cannot be considered more than an interesting and illuminating commentary upon the subject of rhetoric itself, which in no way concerns itself with moral purpose, its one great object being to persuade an audience by means of the written or spoken word. This was the one primary aim of the American Indian, who gave very great attention to the strict rhetorical form and force of his public speeches.

The Graphic Word.—Rhetoric which has been skilfully and artfully employed by savage, barbaric, semi-barbaric and civilized races alike, to the one great end, persuasion, formed the guiding force of the spoken word long before there were writers to define its provinces and uses and to lay down laws for its proper employment and rules for its acquirement. In early times the great orator was looked upon as a person inspired by the gods just as much as were the prophet and the poet. The effective rhetorical use of words to the more primitive mind had something strangely mysterious and divine about it. This is embodied graphically in the Biblical statement: "In the beginning was the Word, and the Word was with God, and the Word was God." (John i, 1). The idea conveyed in the graphic introduction of John is that of the orator, divine orator creating the world by the power of his word just as the earthy orator moves the imagination and the hearts of men by the beauty and strength of his oratorical presentation of his thoughts. The public utterances of the kings of Egypt were held to be the divinely-inspired words of the highest of their gods, Ra, whose representatives the sovereigns were held to be upon earth; and they were likened to the strong and shining beauty of the great sun himself. In most of the Asiatic countries the power of oratory was accredited to a like divine origin. This idea was carried to its logical conclusion among the Semitic races, and more especially among the Jews, the fiery utterances of whose great priests were held to be the revelations of the divine prophets of the God of gods and the Lord of hosts. Thus throughout the long ages stretching from barbarism to the present, the one great object of oratory and rhetoric has been persuasion, the moving of the minds of men. Among the Jews the rhetorical speeches and writings of their prophets and the lofty religious compositions of their poets, historians and chroniclers were early collected and guarded as the sacred possession of the race.

Profane Rhetoric and Rhetors.—At this early period in the history of rhetoric, there could be no rules for its acquirement and use, since that which is held to be a divinely inspired gift cannot be affected by earthly means.

But the practical Greeks and Romans, and before them, to some extent at least, the Babylonian and other cultured races of Asia Minor, had developed orators quite apart from the person of the sovereign and the service of religion. These *rhetors*, as they were called in Greek, were intimately connected with the civic life of the Greek community. Already in the case of these men, the old idea of the divine inspiration of the spoken word had pretty well disappeared or was accepted only in the general sense that ancient tradition is accepted. The rhetors who appeared before the Greek public as public orators, lawyers, prosecutors and defenders, in the legal sense, soon found the great necessity of becoming masters of the principles of rhetoric with their most effective application. This called into being teachers of rhetoric and oratory who gradually organized rhetorical expression into a science far-reaching and all-embracing within its own special province. Aristotle is credited with having made Empedocles the inventor of rhetoric. He probably was one of numerous early Greek teachers each of whom contributed his part to the gradual development of the science of the spoken word; but the real organizer of the art of rhetoric seems to have been Corax of Syracuse who put forth his method about 446 B.C. It was not until some 30 years later that the new method of Corax, as further perfected by one of his pupils, became known in Athens. There it at once became immensely popular with the Athenian orators; and teachers of the Syracuse method of rhetoric sprang up everywhere. Isocrates, himself one of the greatest orators of his age, founded a noted school of rhetoric, whose influence lasted throughout his life and was maintained afterward by his pupils. This influence extended from 390 B.C. to the middle of the latter half of the century. Aristotle (q.v.) who published his rhetoric in 322 B.C. has done perhaps more than any one other man to give a clear perception of the province, object and rules governing rhetoric. Corax, who had produced his system of rhetoric for the democratic lawyers and professional pleaders who had sprung up after the fall of the tyrant Thrasymachus (472 B.C.) and the establishment of a democracy, divided his subject into five parts corresponding to the development of the public speech; poem, narrative, arguments, additional remarks and peroration; and he showed, by illustration, how to develop and use each. His "art" became the basis of the procedure of the subsequently great orators of Greece. Aristotle presented clearly principles given in a very general, concrete manner by Corax. Aristotle's work, which is divided into three books, discusses at length and with wonderful power of analysis the nature and object of rhetoric, the means of persuasion and the manner of handling these means in order to secure the best effects. He divides the province of rhetoric into deliberative, forensic and epideictic. In the latter part of the work he deals at length with expression, the art of delivery and skill in arrangement. The whole book proceeds on the assumption that rhetoric is an art and the province of the teacher is to show to his pupils the true principles of this art the chief aim of which should be to prove one's point or to appear to do so. At length Aristotle discusses in

a very scientific manner all the problems of rhetoric and its teachings, as he sees them. So well did he handle his subject that not only did his work take the place of that of Corax, but most writers on rhetoric since his day have followed him more or less closely. For more than 300 years the scientific method of Aristotle formed the basis of rhetoric study and procedure for those orators and schools who followed the purer traditions of Greece; but it was opposed by an increasingly large body of orators and teachers of rhetoric who followed the florid Asiatic style of oratory, depending upon practice for perfection, and decrying scientific rules. These two systems were used by Hermagoras of Temnos (in Æolis) as the bases of a new system of rhetoric which attempted to reconcile the two schools by applying the practice of the one to the scientific exposition of the other (110 B.C.). This became the ruling system of rhetoric in Italy and did much for the training of the foremost Roman speakers, orators and jurists, Cicero, Quintilian ('*De Institutione Oratoria*,' 90 A.D.), Longinus ('*Art of Rhetoric*,' 260 A.D.) and Aphthonius ('*Exercise*,' in 4th century). All contributed important marks on the subject of rhetoric. In the 16th and 17th centuries many *Modern Rhetoric* European universities paid considerable attention to the teaching of rhetoric and their textbooks were for the most part the old Greek and Roman writers already mentioned. After this the teaching of rhetoric in schools and universities gradually became less and less effective, to meet however with a very imperfect revival in the 19th century. Among the well-known works of rhetoric belonging to the Renaissance are '*The Art or Craft of Rhetoryke*,' by Leonard Cox (1540); '*Art of Rhetorique*' by Thomas Wilson (1553); several treatises (in French) by Tonquelin (1555) and Courcelles (1557). To the modern age of rhetoric belong such popular books as Blair's '*Rhetoric*,' Campbell's '*Philosophy of Rhetoric*,' Whately's '*Elements of Rhetoric*' and a large number of textbooks for schools. In the United States there arose, in the latter half of the 19th century, various schools of oratory, rhetoric and dramatic art, which aimed to teach their pupils the principles of rhetoric so as to fit them for the stage, the pulpit and the forum. Teachers in these schools have published works on rhetoric, oratory and dramatic art; but these publications, where really valuable, have been almost altogether based on the principles expounded in the works already mentioned. German and French schools have also paid considerable attention to the teaching of rhetoric from the point of view of the spoken word. All modern universities have departments of rhetoric, though too often the teaching of the rhetoric department is confined to the exposition of the principles of correct and effective composition in prose and verse, without any attempt to apply these principles to practical public speaking. The result of this neglect to combine theory and practice is shown in the very defective oratory and rhetorical presentation by the public speakers of the day.

Figures of Rhetoric.—Writers on rhetoric from very early times have distinguished numerous forms of language, which are departures from the straightforward speech of the

masses of the people. Such figures are natural to every tongue; and they belong to the uncultured speech of the savage as truly as they do to the most highly cultured language of modern civilization. The human mind constantly works in the same way under given conditions. It thus produces the same kind of figures of speech, which are due to imagery, arrangement of words as a sentence or phrase or to apparent contradiction. It is possible for one figure of speech to contain these three subdivisions. The figures of imagery are metaphor, allegory, synecdoche and metonymy; while those of arrangement consist of climax and antithesis. The figures of contradiction embrace irony, epigram and hyperbole. In addition to these there are numerous minor figures of speech which often belong to two of the above classifications or are merely peculiar sentence structures caused by the form in which the thought is presented. These include asyndeton, apostrophe, apophasis, epanorthosis, negative, interrogation, epistrophe, epiploce, epiplexis, euphemism, antiphrasis and onomatopoeia.

Scientific Investigations.—Modern students of rhetoric, including dramatic art, have given considerable study to the investigation of the relation of the orator to his audience and to the effect of rhetoric and oratorical display not only upon the actual audience of the speaker or writer but upon society, through the medium of his hearers or the subsequently printed discourse. Some writers have also considered minutely and at great length of mental processes involved in the production of oratorical effects and the kind of faculties involved. They have also given careful attention to the 'speech habit' and the best way of acquiring it; and, in connection therewith, they have discussed, from almost every point of view, the character and probable causes of the display in the individual of those superior talents universally recognized as genius. The investigation has been carried into the field of social problems, where experiments have been conducted to show to what extent language is a social bond. See ELOCUTION; ORATORY; SPEECH; FIGURES OF.

JOHN HUBERT CORNYN,
Birmingham Southern College.

RHETT, réi, Robert Barnwell, American politician: b. Beaufort, S. C., 24 Dec. 1800; d. Saint James' Parish, La., 14 Sept. 1876. He was the son of James Smith, but in 1837 adopted the name of Rhett, a prominent colonial ancestor. He studied law, was elected to the legislature in 1826, and in 1832 was elected attorney-general of the State. He was one of the leaders of the Nullification movement and a more strenuous advocate of States' rights than even Calhoun. In 1837-49 he sat in Congress and in 1850 was elected to succeed Calhoun in the Senate. He stoutly upheld slavery, opposed all compromises and in 1851-52 he urged the secession of South Carolina, whether accompanied by other States or not. After the elections of 1852 Rhett resigned from the Senate and retired to his plantation. He later edited the *Charleston Mercury* in which he advocated his extreme views, and in 1860 he again came into prominence as a member of the South Carolina Convention and was one of the committee which wrote the address giving reasons for secession. He was a delegate to the provisional congress at Montgomery, Ala., in 1861 and later an active member of the Confederate Congress. He removed to Louisiana after the war.

RHETT, Thomas Grimke, American military officer: b. South Carolina, about 1825; d. Baltimore, Md., 28 July 1878. He was graduated from West Point in 1845, served in the Mexican War, was brevetted captain for conduct at Puebla in 1847 and in 1858 received rank as major. In 1861 he resigned his commission in the United States army and was commissioned major-general by the governor of South Carolina. He was chief of staff to General Johnston until 1862 and was then assigned to the trans-Mississippi department. He served as colonel of ordnance in the Egyptian army in 1870-73 and then resigned.

RHEUMATISM, a constitutional disease marked by inflammation of the connective-tissue structures of the body, especially of the muscles and joints and attended by pain in them. It is frequently recurrent. In a popular sense it covers nearly all forms of painful arthritic and muscular disease. Four forms are recognized in medicine: (1) Acute rheumatism (acute articular rheumatism or acute rheumatic arthritis, acute inflammatory rheumatism, rheumatic fever); (2) chronic rheumatism; (3) rheumatoid arthritis (arthritis deformans, osteoarthritis—chronic articular rheumatism); (4) muscular rheumatism or myalgia. Acute rheumatism, also a milder form known as sub-acute and chronic rheumatism—may insensibly follow one another—alternating it may be and even the different varieties may co-exist at the same time.

Acute rheumatism is attended with high fever, sour sweat, scanty high-colored urine containing a large amount of urea and swelling of the joints from exudation into their cavities and infiltration around them. The joints are tender and hot. The local symptoms may recurrently pass from one joint to another. There is a tendency to inflammation of the endocardium (endocarditis) and of the pericardium (pericarditis). Predisposing causes of the disease may be heredity, sudden checking of the perspiration in a cold and damp atmosphere, conditions which lower vitality such

as chronic alcoholism, nervous debility, worry with exposure, insufficient food, injuries to joints, and excessive muscular work especially in a poisonous atmosphere.

More males than females have acute rheumatism, probably because of more hardship and exposure. It is quite common among farmers, longshoremen, coachmen, stokers, motormen, sailors, scrub-women, etc. It most frequently occurs between the ages of 15 and 30, is rare before the 10th year and after the 50th. The disease is rare in the tropics, common in the temperate zones; in the United States it is most frequent in the early spring and late fall; and it is often endemic and sometimes epidemic. The specific cause in at least the first three forms of rheumatism mentioned above is now generally believed to be a micro-organism, known as a strepto-diplococcus, the "micrococcus rheumaticus," yet by some writers the various forms of rheumatism are believed to be due to non-neutralized acid poisons of protein metabolism—auto-infection.

The theory of an arthritic diathesis as a cause, and the theory that rheumatic joint lesions are due to disturbances of the nervous system seemed to have passed away. Tonsillar disease has come to be associated with rheumatism and is believed by some to be due to rheumatism, for the most common habitat of the specific germ is in the tonsil crypts, where it may remain quiescent for months or years, until lowered vitality and a sore throat affords a suitable chance for it to do its specific work, in the joints, heart, kidneys, nerves, brain and the various fascia of the body. It is believed that any focal point of suppuration within the body may afford a starting point for infection—if the specific organism is present—as in pyorrhea—middle ear and post nasal discharge, gonorrhea, abscesses, fissures—chronic appendicitis, etc.

The morbid anatomy of rheumatic joints show synovial membrane swollen and hyperæmic; serous infiltration of ligaments and other tissues; joint fluid turbid with albumen, fibrin and leucocytes (pus and blood rarely present); sometimes ecchymoses on cutaneous and serous surfaces. In the blood the red corpuscles are reduced more than one-half; the hæmoglobin is much less than normal, but fibrin and leucocytes are largely increased. There are various complications of acute rheumatism, chorea, conjunctivitis, nephritis, pleurisy, etc., but the most serious are endocarditis and pericarditis. The heart is affected in very many cases, most frequently the left side (rheumatism of the heart), the edges of contact of the mitral valves being swollen and covered with fibrinous masses; less frequently, the aortic valve; rarely, the pulmonary or tricuspid. Contraction and distortion of the affected valves may result. Ulceration is rare. Simple fibrinous or sero-fibrinous pericarditis is common; myocarditis seldom occurs. The attack may begin with headache, indigestion, aching, chilliness, slight tonsillitis or pharyngitis, but usually comes with a chill, followed soon by high fever (may be 103° or 104° F.), swelling, tenderness, heat and shiny appearance of one or more joints (knees most often, then wrists and fingers, ankles, etc.), a coated tongue, foul breath, a soft pulse of 100° to 110°, thirst, constipation and by profuse sour sweat. There is always a tendency to re-

currence, complications and migration from one joint to another. The mind is clear, except when the fever is very high. Coma, which is rare, is due either to high fever or nephritis.

So-called cerebral rheumatism is due to a toxic congestion. Sometimes urticaria and spots of ecchymosis appear upon the skin and in children small nodules, firm but movable, are attached to tendons and fasciæ, and are found over the spine, scapula and inflamed joints. Acute rheumatism is to be distinguished from arthritis following scarlet fever and found in the course of other diseases—due also to specific germs—and from acute osteomyelitis, scurvy (in children), gout and gonorrheal rheumatism.

There is a sub-acute rheumatism, very common, with mild symptoms and slow recovery. It may follow an acute attack or be sub-acute from the outset and may pass into the chronic form. Temperature is seldom above 102° F. The so-called acute rheumatism of children is usually sub-acute; the joint-symptoms may be so slight as to be readily overlooked, but there is more liability to cardiac inflammation than in adults. Children perspire less, but are liable to have chorea, tonsillitis and cutaneous manifestations. If not treated acute rheumatism lasts from two to three weeks or more.

Severe cases may recover under treatment within a week; and mild cases last several weeks, so obstinate sometimes is the disease. The joints are not left with fibrinous adhesions unless chronic rheumatism supervenes. Death is rare, and when it occurs it results from high fever, pneumonia, pleurisy or myocarditis. Relapses are quite common. Treatment requires many details. Among preventive measures are care against exposure to cold and damp, especially when overheated; freedom from muscular strain; the wearing of woolen underclothing in winter, and of linen-mesh in summer; abstinence from sweets and malt liquors; very moderate eating of animal food; sponging with cool water, followed by friction; outdoor exercise; and the keeping of the bowels open with Carlsbad water or Rochelle salt. During the attack place the patient between blankets on a comfortable mattress; have him use a bed-pan carefully dispose the inflamed part in a comfortable position. While the disease is severe give light food, no meat, sweets or mal liquors; allay fever with cool spongings and tincture of aconite; quiet the patient with Dover's powder or codeine; locally apply methy salicylate, oil of wintergreen, or equal part of guaiacol and glycerin; and keep the part warm with cotton batting, oil-silk, etc. Medically, salicin, salol, or salicylate of soda or bicarbonate of potassa or soda, or the citrat of potassa seem to be of most avail.

Chronic rheumatism is a form of chronic joint-inflammation, attended by moderate pain and by changes in the joints resulting in the deformity. It begins insidiously, or follows attacks of acute or sub-acute rheumatism, and is rare before the 40th year. The predisposing causes are poor hygienic conditions, debility, malnutrition, cold and damp, and occupation which involve the repeated and long-continued use of certain joints, as in the cases of seamstresses and tailors. A moderate thickening in some distortion appear in affected joints (fingers and knees especially) which may be bilatera

The changes are mainly in the fibrous tissues, though sometimes there is synovial injection and effusion. Erosion of cartilages is seen only in prolonged cases. Endocarditis, pericarditis and pleurisy are rare.

The symptoms slowly develop; general health may be good; pain occurs when joints are red and swollen, and may be severe at night. Joints swell from time to time, and some persons readily predict an attack. The muscles about the joints after a time atrophy and the affected joints are deformed by deflection due to adhesions. Slight fever may accompany attacks. The diagnosis excludes gout and arthritis deformans (qq.v.).

In treatment medicine is of uncertain value. Iron, Vichy water, iodide of potassium and Carlsbad salts or phosphate of soda may be used. More relief is to be obtained from douching and sweating of the joints, massage, protection against cold and damp and injuries to the joints, an ample diet (no sweets, and no alcoholic stimulant except whisky), a dry equable climate and residence at one of the spas. Bee stings have proved valuable.

Rheumatoid arthritis, a better term than arthritis deformans, may follow acute or chronic rheumatism or apparently may start de novo. It frequently is associated with neuritis. It usually does not come to persons under 50 and is an obstinate disease, seldom fully recovered from. It is marked by varying attacks of severe localized or shooting (neuritic) pains, by tenderness and soreness of joints, by contraction and sometimes severe jerks of muscles about the joints and leading to them, by atrophy of muscles, bony nodes about joints and fibrous bands within joints, numbness of heels, constriction about chest and neck, sometimes marked deformity of one or more of the limbs rendering person unable to move the affected limbs. Yet with it all, the afflicted person may live for years, and at times have spells of good general health. Treatment usually unsatisfactory—static electricity, bacterium, local heat, soothing applications, internal medicines (for the physician to advise)—proper food, keeping the bowels clean and living as much as possible in out-door air.

Muscular rheumatism or myalgia is a painful affection of various voluntary muscles and of the fasciæ and periosteum to which they are attached. It is most common in youth and young adults and among those exposed to cold and damp when overheated and those who over-use certain muscles. Heredity, goutiness and lithæmia are predisposing causes. The disease is never fatal, whether it is neuralgic in character or is an inflammation of muscular tissue (myositis) is not determined. The symptoms include local pain and tenderness, increased by contraction or movement of the affected muscle; usually the pain is an intense dull ache. There is seldom any heat, swelling or redness. Occasionally the muscle cramps and is most comfortable if semi-flexed. Sometimes there is fever. In torticollis or stiff-neck (unilateral) some of the muscles of the neck are involved. The patient dreads to move the head, and moves the body instead. In pleurodynia one side is affected (generally the intercostal muscles, but sometimes in the serratus and pectoralis), usually the left. Pain is increased by movements, coughing or sneezing.

Lumbago, a muscular rheumatism affecting the muscles of the lumbar region and their tendinous attachments, is bilateral, quite frequent, and is often caused by strain of the muscles of the loins. An attack often begins suddenly with an excruciating pain when the sufferer is attempting to rise from a sitting posture, or to change his position in bed. If the loin-muscles are kept rigid the patient may be able to move about. Treatment calls for rest of affected muscles (best in bed), the application of heat and anodyne liniments, ironing the loins with a hot flatiron over a few thicknesses of flannel or thick wrapping paper, or galvanism.

Muscular rheumatism is distinguished from neuralgia by localized pain, increased by voluntary movements, and by the absence of tender spots. Recovery usually occurs in a few days, except in debilitated persons, those with rheumatic tendencies or subjects of chronic alcoholism.

Preventive treatment requires freedom from damp and cold, and from muscular strain, sponging and friction, vegetable diet and warm underclothes. Massage and a Turkish bath may prevent an attack. For local treatment rest, heat, turpentine stupes and anodyne liniment are of use. Medicine is of little value. In pleurodynia, strapping the chest, or the use of a wide flannel binder, is often of much service.

RHEUMATISM-ROOT. See TWIN-LEAF

RHEYDT, rit, Germany, a town of Prussia, in the government of Düsseldorf, 16 miles west of Düsseldorf, important on account of its industries, which embrace silk and satin goods, cottons, and mixed fabrics, foundries and machine-shops, printing and dyeing works, breweries, distilleries, etc.

RHIGAS, ri'gas, Constantine, Greek patriot: b. Velestino (the ancient Phæra) about 1753; d. Belgrade, Servia, 1798. He wrote not only in Greek but also in French, and was a poet and proficient in music. He formed the bold plan of freeing Greece from the Ottoman Porte by means of the secret association of the Heteræa, and succeeded even in bringing powerful Turks into his conspiracy. From Vienna he kept up a secret correspondence with the most important confederates in Greece and in other parts of Europe. At the same time he composed in his native language a number of patriotic songs, calculated to inflame the imagination of the Greek youth and embitter them against the Mussulmans. Having been arrested in Trieste he was with several other prisoners conducted to Vienna. Rhigas and three others of those arrested were sent back in chains to Belgrade in May 1798, and put to death by the Turkish authorities. During the Greek War of independence, which ultimately led to the emancipation of their country from the Turkish yoke, his songs were in the mouth of everyone. The most celebrated of them are his translation and adaptation of the 'Marseillaise.' Consult Edmonds, 'Rhigas Pheraios, the Protomartyr of Greek Independence' (1890).

RHINE, rin, a river of Germany. It is one of the most picturesque rivers in the world, and its natural beauty is heightened by the historic and legendary traditions with which its name is associated. Its direct course is 460

miles long and its indirect course about 800 miles; the area of its basin is about 86,600 square miles. It is formed in the Swiss canton Grisons by three main streams called the Vorder, Mittel and Hinter Rhein, or the Upper, Middle and Lower Rhine. The Vorder Rhein rises in the small Toma Lake (7,690 feet high), lying to the northeast of the Saint Gothard, and is augmented by two streams which unite with it near Chiamut (5,380 feet). The Mittel Rhein issues from a small lake west of the Lukmanierberg, traverses the Medelserthal, and joins the Vorder Rhein at Disentis, from which point the united stream is called Vorder Rhein. It takes an easterly direction, and at Reichenau unites with the Hinter Rhein, which issues from the Rheinwald Glacier, in the Adula group, and has a course of about 70 miles through the Rheinwaldthal before reaching Reichenau. Here the stream takes the name of Rhine, has a width of 130 to 140 feet, and admits of floating. The Rhine first becomes properly navigable at Coire after receiving the Plessur. It now turns north, and shortly after being augmented by the Landquart quits the Grisons, forms the boundary between the canton of Saint Gall on the left and Leichtenstein and Voralberg on the right, receiving the Ill from the latter, and enters the Bodensee or Lake of Constance, continued by the Untersee. On issuing from the Untersee it flows west, separating Switzerland from the grand-duchy of Baden, and continues its course to Schaffhausen and Basel, receiving, as it proceeds, on the left of the Goldach, Thur, Thöss, Glatt and Aar, and on the right the Wutach and Alb, mountain streams of the Black Forest. At Schaffhausen the river forms perhaps the grandest waterfalls in Europe. At Basel it again begins to flow north, when it separates the German territory of Alsace from Baden, forms the boundary between the latter and the Bavarian palatinate, flows thereafter through the grand-duchy of Hesse, forms the boundary first between it and Nassau, and then between Nassau and the Prussian Rhenish province, till it wholly enters the latter at Coblenz. Below Emmerich it enters the Dutch province of Gelderland, and shortly after divides into two branches, a south and a north. The south, called the Waal (anciently Vahalís), carries off two-thirds of its water, and joins the Maas or Meuse at Woudrichem. The north branch, after making several windings in its course to Arnhem, but still retaining the name of Rhine (Rijn), divides at Westervoort, before reaching Arnhem, into two branches. Of these the right proceeds as the New Yssel, in the bed of the canal which Drusus dug to connect the Rhine with the Old Yssel, till it reaches Doesburg, where the New and Old Yssel unite to pour their accumulated waters into the Zuyder Zee. The left arm proceeds, under the name of Rhine, in a course nearly parallel to the Waal, passing Wageningen and Rhenen to Wijk-by-Durstede, where it again bifurcates, sending a very feeble branch, under the name of the Crooked Rhine, to Utrecht, where, by the canal of Vaart, it communicates with the much larger branch, called the Leck, and flowing past Vianen and Schoonhoven unites with the Maas above Grimpen-op-de-Lek. The Crooked Rhine becomes little better than a

ditch; on leaving Utrecht it proceeds toward Leyden, and at the beginning of the 19th century was lost in the sand beyond the Katwijk-aan-den-Rijn. At an earlier period it had here found an outlet into the ocean; and in more recent times, after surmounting many difficulties, the lost water of the Rhine has been collected in a canal, and by the aid of three sluices the outlet has again been established. The breadth of the Rhine and the character of its channel differ much at different parts of its long course. Its breadth at Basel is 750 feet; between Strassburg and Spire from 1,000 to 1,200 feet; at Mainz 1,500 to 1,700 feet, and at Schenkenschanz, where it enters the Netherlands, 2,150 feet. Its depth varies from 5 to 28 feet, and at Düsseldorf amounts even to 50 feet. The Rhine abounds with fish, including salmon and salmon-trout, but more especially sturgeon, lampreys and carp. Wild fowl also abound on its banks and countless islands. Some gold is contained among the sands brought down into it from the mountains of Switzerland and of the Black Forest.

The navigation of the Rhine is very important, particularly for west Germany. The navigation is rendered dangerous by waterfalls, more especially those of Schaffhausen, of Zurzach (near the mouth of the Wutach), of Laufenburg and of Rheinfelden; it is also rendered dangerous by the Bingerloch, near Bingen, where the stream becomes suddenly narrowed and confined between lofty precipices, and by similar causes, though in a less degree, at Bacharach, Saint Goar and at Unkel.

The Rhine is distinguished alike by the beauty of its scenery and the rich fields and vineyards which clothe its banks. Hence no river in Germany, more especially since the introduction of steam-vessels, attracts so many tourists. From Basel to Mainz it flows through a wide valley, bounded on the left by the Vosges, and on the right by the Black Forest and the mountains along the Bergstrasse. From Mainz the mountain ridges approach the stream at first only on the right bank, where they form the Rheingau; but at Bingen they begin to hem in the left bank also, and continue from thence to Königswinter to present a succession of lofty mountain summits, bold precipices and wild romantic views. Pleasant towns and villages lie nestled at the foot of lofty hills; above them on all sides rise rocky steep slopes clothed with vines, and every now and then the castles and fastnesses of feudal times are seen frowning from precipices apparently inaccessible. At times the chain of ridges on either side opens out and allows the eye to wander into romantic valleys, along which tributaries of less or greater magnitude keep dashing down or gradually winding to the parent stream. On the river itself much additional variety and beauty are given to the scenery by the constant recurrence of picturesque and verdant islands.

Scarcely a river in the world is of importance to more people than the Rhine. Since long before Cæsar's day this great stream has been the scene of stirring events in the world's drama. Vercingetorix, Charlemagne, Tilly, Wallenstein, Frederick the Great, Napoleon Bonaparte, Bismarck, Moltke, Foch and Pershing, these are some of the illustrious names in the long roll of warriors who strove along its

banks for command of this great highway. Famous in song and story, lined with great cities and ruined castles of robber barons, it is the Mecca of tourists at all seasons of the year. Up one side and down the other, or by river from Cologne to Mainz, every mile has its beauties and its legends. Between Darmstadt and Heidelberg the Taunus Mountains shut in its basin on one side, the Odenwald, scene of the Siegfried saga of Wagner's Nibelungen operas, on the other. An ideal region for the man fond of walking tours, for the villages are so close together that no spot along its banks is more than an hour's walk from a village. Cyclists and automobilists find good roads, generally military highways, all the way from Holland to Basel and the Lake of Constance. For the international control of the Rhine as formulated at the Paris Conference in 1919 see WAR, EUROPEAN. Consult Clapp, E. J., 'The Navigable Rhine' (New York 1911); Hugo, Victor, 'The Rhine' (Boston 1874); Hunt, 'The Rhine: Its Scenery and Historical Legendary Associations' (London 1845); Mackinder, H. J., 'The Rhine' (New York 1908); Mansfield, F. M., 'Cathedrals and Churches of the Rhine' (Boston 1906); Mehlis, 'Der Rhein' (Berlin 1876-79); Stieler, Karl, et alii, 'The Rhine from Its Source to the Sea' (2 vols., London 1888).

RHINE, Confederation of. See CONFEDERATION OF THE RHINE.

RHINE, Province of the, or RHENISH PRUSSIA (Ger. *Rheinland*), the westernmost province of Prussia, touching west and north, Luxemburg, Belgium and Holland; greatest length from north to south about 200 miles, greatest breadth about 90; area, 10,423 square miles. It is divided into five governments or districts, Coblenz, Treves, Cologne, Aachen (Aix-la-Chapelle), and Düsseldorf. The city of Coblenz is the official capital of the province, but Cologne is the town of most importance. The southern portion of the province is hilly, being traversed by the ranges of the Eiffel, Hochwald, etc. It is watered by the Rhine, the Moselle and some affluents of the Meuse. A large proportion of the surface is in forest. Besides the usual cereal crops, tobacco, hops, flax, rape, hemp and beet-root are raised; fruit culture and the vine culture are also carefully attended to. Cattle are extensively reared. It is the most important mineral district in Germany, abounding in coal, iron, lead, zinc, etc. The Ruhr and Saar coal districts have aided in the industrial development of the province. It is likewise an active manufacturing district, there being numerous iron works and machine-shops, textile factories, glass works, tanneries, chemical works, sugar refineries, breweries, distilleries, etc. Its textile industries are among the best in the world. There are over 2,900 miles of railway. A large portion of the province came within the neutral zone reserved by the conquering Allies, according to the terms of the armistice of 11 Nov. 1918. (See WAR, EUROPEAN). Pop. about 7,121,140, of whom 70 per cent are Roman Catholics. Consult Tollman, O., 'Die Eifel' (Bielsfeld 1912); Kerp, 'Am Rhein' (ib. 1901); Kollback, Karl, 'Rheinisches Wanderbuch' (2d ed., Bonn 1897); Mehlis, 'Studien zur ältesten Geschichte der Rheinlande' (Leipzig 1875-79); Schwann,

'Die Rheinlande von Mainz bis Koblenz' (ib. 1900); Tille, 'Uebersicht über den Inhalt der kleineren Archiv der Rheinprovinz' (Bonn 1899-1902).

RHINE WINES. See WINE AND WINE MAKING.

RHINELANDER, rin'län'dér, Wis., city, county-seat of Oneida County on the Wisconsin River and on the Minneapolis, Saint Paul and Sault Sainte Marie, and the Chicago and Northwestern railroads, about 100 miles northwest of Green Bay. The Pelican Rapids in the Wisconsin at this place furnish extensive waterpower. It is in a lumbering region, and its chief manufacturing establishments are lumber mills, paper mills, refrigerator works, boat building works, iron works and minor industries. There are several churches, Saint Mary's Hospital, public schools, one parish school and a Carnegie public library. The banks have a combined capital of over \$100,000. The government is vested in a mayor and 12 aldermen. Pop. 5,637.

RHINITIS. See NOSE AND THROAT, DISEASES OF.

RHINOCEROS, a massive hoofed mammal of the family *Rhinocerotidae*, characterized prominently by its nasal horns, the species of which are now confined to South Africa and southeastern Asia, although in past ages of world-wide distribution. These animals are all of large size and ungainly form, and the very thick skin is usually thrown into folds of more or less definite kind, and as a rule is very sparsely haired. The limbs are stout and comparatively short, and terminate in round feet with three toes on each foot, each toe encased in a hoof. The skull is of pyramidal form, with a confluent orbit and temporal fossa, and the nasal bones are very prominently developed, and support one or more "horns," which grow one behind the other. The muzzle is extended by a more or less elongated pointed and prehensile upper lip; the incisors and canines are diminished but functional in the African species, and entirely wanting in adults of the Asiatic species. The cheek-teeth are massive and their crowns exhibit complexly folded ridges, varying much with the species. The horn of the Rhinoceros is of epidermic origin based upon thickened "bosses" of the underlying bone, but really formed of fibres of horn practically bristles, agglutinated as they grow.

Indian Rhinoceros (*Rh. indicus*), grown to 22 ft. in length.

When two horns are developed, the hinder one is borne by the frontal bones, and is situated in the middle line behind the front horn. The front horn is generally much larger than the hinder one, the latter, when larger, possessing a different shape from the front structure.

They serve many useful purposes in savage economy, but are of little service in civilized arts, although formerly the horn was considered to have medicinal and even magical virtues, especially in the detection of poisoned wine.

Although subdivided by some zoologists, the rhinoceroses may properly be regarded as forming only a single genus, *Rhinoceros*, with five existing species, and some extinct species, to which must be added several genera known only by fossil remains.

The most familiar species is the typical one-horned or Indian rhinoceros (*Rh. indicus*), which, like all the Asiatic species, has the skin thrown into very definite folds, corresponding to the regions of the body. The horn of this species is black, very thick, from one to (rarely) two feet long and rises from the tip of the nose. The upper lip is very large and overhangs the lower; it is furnished with strong muscles and is employed by the animal somewhat as the elephant uses his trunk. The skin is naked, rough, extremely thick and of a purplish brown hue. About the neck it is gathered into large folds; a fold also extends between the shoulders and fore-legs and another from the hinder part of the back to the thigh. It is naturally soft and easily penetrated by a rifle-ball or hunting knife, but when suitably dried is exceedingly hard and polishable. The tail is slender, flat at the end and furnished at the sides with very stiff black hairs. The animal was well known to the ancients when it ranged over most of the peninsula of India and was introduced into the games of the circus by Pompey. From the time of the fall of the Roman Empire, however, it was lost sight of so completely, that prior to the 16th century, naturalists were of opinion that it had never existed, or, if so, that it was extinct. When the Portuguese, however, opened the way to India, these animals again became known, and many were introduced into Europe, a historic one, sent by an Indian potentate to the king of Portugal in 1513, stood as model for a well-known drawing by A. Dürer. This species is now much restricted in range and not to be found outside of the plain of Assam, where it confines itself to the marshy grass-jungles, where, like its relative, the tapir, it is fond of wallowing in the mud. Though possessed of great strength and a match for either the tiger or the elephant, it is quiet and inoffensive unless provoked. The

Its chief food is canes and shrubs. The flesh somewhat resembles pork in taste, though of a stronger flavor and coarser grain. It can be successfully hunted only by the aid of elephants, and is now protected by law against extermination. It lives well in captivity and specimens may be seen in many zoological gardens, but it does not breed in captivity.

The Javanese or Sondaic rhinoceros (*Rh. sondaicus*) is distinguished from the Indian species by smaller size, shorter horn and differences in the disposition and tessellated appearance of the skin-folds, which is also somewhat more hairy. It occurs in the Sunderbunds of India, in Bengal and in the Malayan Islands. The Sumatran rhinoceros (*Rh. sumatrensis*) is well distinguished by having two horns, the rear one like a big knob, and in being clothed with a comparatively thick coat of hairs. Its range is similar to the Sondaic species, but it also extends to Borneo. A variety living in the Assamese swamps has been called the hairy-eared rhinoceros (*Rh. lasiotis*). The upper lip of this species forms a short proboscis and it gets its food mainly by browsing shrubs.

The African rhinoceroses are two, both differing from the Asiatic group in dentition, and in the absence of the armor-like plates and folds in the hide, which is hairless and lead-colored. Considerable variation exists, so that half a dozen or more distinct forms have been named, but all seem referable to two species,—the ordinary widespread African rhinoceros (*Rh. bicornis*), and the square-mouthed (*Rh. simus*). The former is to be found, except where killed off by civilization, throughout all southern and eastern Africa outside of the equatorial forests, and it does not show the fondness for swamps which characterizes the Asiatic congeners. Its front horn is broad and raised as on a base, sharp-pointed and curved slightly backward, while the hinder horn is usually shorter and more conical. The head is rounded. This animal appears to be of ferocious disposition, and is quick and active and greatly feared by the natives. The food consists largely of roots, which it digs out of the earth by aid of its horn. The side of the horn is thus frequently rubbed by contact with the earth. This long horn may attain a length of three to three and one-half feet, and straight ramrods are made from it. The lip is somewhat pointed and prehensile and the animal browses much of the time. It is justly regarded by hunters as one of the most dangerous animals in the world to meet and it often charges from ambush or dashes frantically through a camp, so that many persons have lost their lives by it outside of chosen encounters.

The square-mouthed, white or Burchell's rhinoceros is a northerly and now almost extinct species (*Rh. simus*) which dwelt in east Africa and was distinguished by its huge size, a male standing six and one-half feet high at the shoulder, with the front horn 50 or more inches in length. Its muzzle is short and square, the upper lip being short and its food consisting altogether of grass. Its general habits otherwise are similar to those of the other species.

Fossil Rhinoceroses.—These animals begin to be recognizable toward the end of the Eocene Period, both in Europe and North America; but the first form of which much

African Rhinoceros (*Rh. bicornis*).

female produces one at a birth. The growth of the young is very gradual, as, at the age of two years, it scarcely attains half the height of the adult, which is usually about five feet at the shoulder; such a specimen will measure about nine and one-half feet from the snout to the root of the tail. The sight of this rhinoceros is by no means acute, but, on the contrary, its senses of smelling and hearing are very keen.

definite knowledge is possessed is *Hyracodon* of the Lower Miocene (White River beds) of the eastern slope of the Rocky Mountains. This was a comparatively small, slightly built animal with a longer neck and limbs than later rhinoceroses show and no trace of a horn is perceptible. Like other early forms it was tridactyl, but in some a rudimentary fourth toe (the fifth) remains on the fore foot. The holarctic *Amyndants* were of a habit of life not unlike that of the hippopotamus, as is shown by the height of the eyes and nostrils and the tusk-like teeth. They had no horns. "In North America," says Woodward, "a normal horn does not appear ever to have been acquired, and the race disappeared before the close of the Pliocene. . . . In the Old World, however, the gradual development of the horn can be clearly traced." The earliest definite European remains are of a hornless rhinoceros (*Aceratherium*), which seems to have ranged over all Europe and Asia, and very similar species lived simultaneously in western North America. One of the latter (*Diceratherium*), of small size, had two callosities on its nose side by side and four digits in the front foot. Typical horned rhinoceroses are to be traced as far back as the middle of the Miocene, and they had all the essential features of the modern ones and no one-horned fossils have been found outside of the Indo-Malayan region. The upper Pliocene species bore horns so large that the septum between the nostrils was ossified for their support. This feature is noticeable in the species (*Rh. leptorhinus*) common in England in the time immediately subsequent to the Ice Age, and reaches its maximum in the great woolly rhinoceros (*Rh. tichorhinus*), whose bones are found in the cave deposits and river gravels from Great Britain to China and whose mummified remains have been taken, like those of the mammoth, from the ice-cliffs of arctic Siberia. It had immense horns and was covered with dense woolly hair. Another huge, but aberrant rhinoceros (named *Elasmotherium*) roamed over Russia and northern Asia at the same Pleistocene period, which was sometimes 15 feet long, and bore an immense horn rising from between the eyes.

T., 'Fauna of British India' (London 1888-91). For the palæontology of rhinoceroses, consult Osborn, H. F., 'The Extinct Rhinoceroses' (*Memoirs of the American Museum of Natural History*, Vol. I, Part III, New York 1898); id., 'Phylogeny of the Rhinoceroses of Europe' (*Bulletin of the American Museum of Natural History*, Vol. XIII, ib. 1900).

RHINOCEROS-BIRD, some bird, especially a small white egret, which perches upon the rhinoceros when at rest, searching his hide for ticks and other insects and warns him by its cries of the approach of any intruder. See **BUFFALO-BIRD**.

RHINOSCOPY. See **NOSE AND THROAT, DISEASES OF**.

RHIO, *rê'ô*, or **RIOUW**, *rê-ow'*, a seaport belonging to the Dutch, in the Indian Archipelago, on the islet of Tandjong Pinang, in a bay on the south side of the island of Bin-

tang, 50 miles southeast of Singapore. It is the capital of a Dutch residency, comprising the Rhio Archipelago, the Linga group and the Tambelan, Anambas and Natuna islands, as well as the districts of Kampar, Siak and Indragiri, on the east coast of Sumatra. The population of the residency is estimated at 108,000.

RHIZOME, or **ROOTSTOCK**, in botany, a sort of stem found in herbaceous perennials, running along the surface of the ground, or partially or wholly subterranean, sending forth shoots at its upper end and decaying at the other. It occurs in the ferns, iris, etc.; and in the ferns it may be wholly covered with the soil. In the mints, the sand-sedge, couch-grass and other plants the rhizome is long and slender, but in Solomon's Seal, iris, birthroot, etc., it is stouter. Unlike roots, rhizomes bear scaly leaves at the nodes, and they also send down fibrous roots. The stouter rhizomes may act as storehouses of food.

RHODE ISLAND AND PROVIDENCE PLANTATIONS, one of the New England States, situated between lat. 41° 18' and 42° 3' N., and between long. 71° 8' and 71° 53' W.; bounded on the north and east by Massachusetts, on the south by the Atlantic Ocean and on the west by Connecticut. The extreme length of the State from north to south is 48 miles, and the extreme width from east to west is 36 miles. The area is 1,248 square miles, of which 1,067 square miles, including the island, are land surface. The larger part of the State is hilly, but the general elevation is not great; the highest point, Durfee Hill, in the northwest of Providence County, having an altitude of 805 feet. The large inlet known as Narragansett Bay, ranging in width from 12 to 3 miles, and with lesser bays and inlets branching from it, extends 28 miles inland in a northerly direction. It includes a number of islands, Rhode Island, Conanicut and Prudence Island being the largest. Rhode Island is 15 miles long and about three miles wide, and on it is situated the city of Newport. Block Island lies nine miles from the coast. It is a hilly expanse of verdure-clad sand rising boldly from the Atlantic Ocean. The Great Salt Pond which was formerly enclosed within the island is now an open harbor, and other important improvements have been effected, making the island much more accessible and secure for steam and sailing vessels. The rivers of Rhode Island are small, but they supply much of the power used by great industrial establishments. The Blackstone, Pawtuxet, Wanasquatucket, Moshassuck and West River all in the northern part of the State flow into the Providence River, which in turn empties into Narragansett Bay. It is navigable for trans-Atlantic steamers to Providence. All the streams are rapid for the greater part of their course, and on some of them large dams have been built as reservoirs for the mills. These and the natural ponds add greatly to the picturesque effect of the scenery.

Climate.—The climate is mild, as compared with that of the greater part of New England. The mean temperature for January is 36° and for July 76°, and the humidity averages between 80 and 95 per cent throughout the year. The rainfall ranges from 40 inches in the northern part of the State to nearly 50 inches on the coast.

Geology and Minerals.—In the western part of the State the surface is chiefly composed of Archæan rocks, which in some places, as at Rocky Point, jut prominently into the bay. The bed of the bay itself, with its islands and a large part of both shores, is composed of deposits from the Carboniferous period, but in the great terrestrial disturbances which followed that period, the coal strata in the vicinity of Narragansett Bay underwent changes which greatly affected their value for use as fuel. Coal was discovered at Philipsdale, East Providence, some years ago. It is claimed that the mine contains good hard coal and can be worked profitably. A coal mine is also located in Cranston, near Providence, which has been worked at intervals for many years, but never far from the surface. Excellent granite quarries are worked in different parts of the State, especially at Westerly, whence granite has been supplied for many notable monuments and buildings throughout the United States. Considerable deposits of magnetic iron ore are known to exist along the western edge of the Carboniferous strata, and limestone is abundant in some parts of the State. In 1915 the total value of the mineral output (graphite, lime, building stone, etc.) was \$855,007, as compared with \$777,716 in 1914.

Agriculture.—Extensive farming is not carried on in Rhode Island. Much of the land has been taken for factory sites, villages and small settlements; while the growth of the cities and large towns has absorbed much suburban property, which was formerly under cultivation. As in other States many farms are occupied by persons who do not cultivate them to any great extent; farmers who do get a living from their land generally keep cows and from these derive much, if not all, of their income; and this accounts for the fact that hay and forage form a most important crop. The acreage devoted to this is about 60,000 acres. Corn and potatoes together occupy about one-quarter of this acreage. In Cranston are found some of the largest market garden farms in the United States. Poultry raising is carried on along the most approved scientific lines and yields handsome returns. The State has in all about 5,300 farms, with an area of 443,308 acres, of which 178,344 acres are improved. In 1913 the value of all farm property was \$32,990,739. Farm land per acre averaged \$63.01. In 1917 the acreage planted to corn was 13,000, from which were produced 546,000 bushels valued at \$1,289,000; in the same year 2,000 acres were planted to oats, yielding 62,000 bushels valued at \$46,000; 5,000 acres to potatoes yielding 675,000 bushels valued at \$1,181,000; 60,000 acres to hay, yielding 90,000 tons, valued at \$1,827,000; a total of 80,000 acres in corn, oats, potatoes and hay, yielding an aggregate product valued at \$4,343,000. Vegetables other than potatoes are raised to the value of \$700,000 annually. Nursery products, flowers and other ornamental plants are grown in considerable quantities, the annual value being approximately \$650,000. The small fruits — strawberries, raspberries, etc. — average about 470,000 quarts with a value of \$44,000. The apple crop is valued at about \$150,000 annually; while other orchard fruits are placed at \$50,000. In a good season the grape crop brings about \$10,000. According to present official returns Rhode Island farms have

10,000 horses worth \$1,455,000; 23,000 dairy cows worth \$1,663,000; 11,000 other cattle worth \$295,000; 7,000 sheep worth \$36,000; 15,000 swine worth \$202,000; dairy products sold in 1915 were valued at \$2,600,000.

Manufactures.—The leading industries are the manufacture of cotton and woolen goods, fine tools, machinery, silverware and jewelry. Rhode Island is the parent State of cotton-spinning in America. English laws forbade anyone making a model or drawing of English cotton machinery and sending it out of the country. Samuel Slater, an apprentice to cotton-spinning under Strutt, partner of Arkwright, the great inventor of spinning machinery, mastered the improvements on which he was employed, and came to the United States. Moses Brown invited him to Rhode Island. Slater went, and with the aid of Moses Brown's wealth, he succeeded in producing by the close of 1790, at Pawtucket, R. I., cotton-yarn equal to the best made in England. Cotton-spinning became a great Rhode Island industry, and continued to be the leading industry until the attention of manufacturers was turned largely to woolens and worsteds. The dyeing and finishing of textiles, the silk and silk goods industry and the manufacture of rubber boots and shoes and of electrical apparatus are also among the important and growing industries of the State. In the manufacture of the cheaper quality of jewelry Rhode Island stands first in the United States. In solid silverware the State has no superior. The iron industries are flourishing and include locomotives, engines, screws — the gimlet-pointed screw being a Rhode Island invention — and all varieties of metal tools. According to the Federal census returns of manufacturing establishments in the State in 1914, the capital invested in manufacturing industries amounted to \$308,444,563 in 2,190 establishments; there were 1,883 proprietors or firm members, 8,801 clerks or so-called salaried employees, and 113,425 wage-earners. The raw materials were valued at \$162,425,219, and the output at \$279,545,873. The dyeing and finishing of textiles with an average of 7.92 wage-earners and an output valued at \$16,300,783 in 1914, ranks fourth compared with other industries in the State. Rhode Island rank fifth among the States in the production of cotton goods, third in woolen and worsted goods, sixth in silk and silk goods and fifteenth in hosiery and knit goods. The cotton mills of the State had in 1914, 2,574,942 spindles, consuming 122,403,247 pounds of cotton valued at \$17,813,655.

Banks.—The Providence National Bank founded in 1791, is the oldest Rhode Island bank. The Providence Institution for Savings dates from 1819. In the year ending 30 Jun 1917 there were 17 national banks in the State, three State banks, 15 savings banks, 13 trust companies and 13 branches. The savings bank had 161,470 depositors with \$92,769,759 to the credit, being \$574.53 to each depositor.

Fisheries.—Oysters, lobsters, scup, mackerel and squintague are the most important products of the fisheries, which employ about 1,500 persons and approach in value about \$1,600,000 annually. About \$1,500,000 is invested in the industry. In former years the flats along the bayside produced the clam in abundance which, when baked in the proper way, or t

Rhode Island way, is the most delicious of sea foods. The "Rhode Island Clam Bake" is a State institution known the world over. While clams are not as plenty now as formerly, the supply is sufficient for many years yet to come. The fisheries of Narragansett Bay were menaced for a number of years by the lack of a proper method of sewage disposal, but the city of Providence at a very great expense has provided a system of clarifying the sewage and this evil has been entirely removed. The total annual product of the lobster fisheries, according to the latest available data, was 1,425,000 pounds, valued at \$152,000. This branch of the fisheries has been the especial study of the Commission on Inland Fisheries which, after many experiments, has devised a method of rearing young lobsters until they become able to take care of themselves, thus making it possible to increase greatly the number of lobsters inhabiting the waters of the State.

Railways.—The New York, New Haven and Hartford Railroad Company controls railroad operations in the State. The railroads within the State comprise 202 miles of single track and a total mileage of all tracks operated of 446.40 miles and 359.96 miles single track of electric railway. The total length of single track, operated steam and electric, is 562 miles; the net income, steam and electric, amounted to \$6,101,381.60 in 1915. After a long period of controversy over location and terms for the disposal of the so-called "Cove Lands," in the centre of the city of Providence, and over which the tide formerly ebbed and flowed, a union station was erected where all railroads now enter.

Commerce.—The export commerce from Rhode Island ports is insignificant. Receipts from foreign imports at the port of Providence for the year ending 30 June 1915, amounted to \$320,563.49, which included the custom districts of Providence and Newport. Congress has made liberal appropriations for the improvement of harbor facilities at Block Island. The wharves at Providence and other ports, which once gave room to Indiamen, whalers and privateers, now accommodate steamers and other vessels used in the coastwise trade and summer travel. The boat-building industry of Bristol is known the world over on account of the Herreshoffs, who have constructed several successful defenders of the America's Cup. Narragansett Bay has become a pleasure resort from Providence River to Newport in the east and Point Judith in the west, and in this way a large amount of money is brought into the State while wealthy men from New York and elsewhere, with summer homes in Rhode Island, have selected the State as their legal residence and pay personal taxes there.

Finance.—Since the State recovered from the final disorder occasioned by the War for Independence its credit has always been of the highest, and its obligations promptly met. The construction of the new State House at Providence and other improvements due to the growing needs of the commonwealth have led to extraordinary expenditures within recent years and at the close of the year 1917 the net indebtedness was \$6,437,226. On 1 Jan. 1917 the balance in the State treasury amounted to \$32,839; the revenues during 1917 amounted to \$4,507,000, making a total of \$4,539,839. The ex-

penditures for the same year aggregated \$4,046,292, leaving cash on hand 1 Jan. 1918 at \$493,547. The assessed value of the property within the State in 1917 was real property, \$495,006,727; personal property, \$273,083,498, making a total of \$768,090,225.

Population.—Rhode Island was the most densely inhabited State in the Union by the census of 1910, which gave 542,610 as the total population or 508 inhabitants to the square mile. It is the only State east of the Mississippi River where a majority of the population are not natives of the State. In 1915 the population by sex and birth was:

	White	Negro	Asiatic Indian	Total
Male.....	291,556	5,751	545	297,852
Female.....	292,809	5,129	196	298,134
Total...	584,365	10,880	741	595,986

The foreign-born whites numbered 135,894, of whom Canada contributed 23.5 per cent; Ireland 16.7 per cent; England 15.6 per cent and Italy 15.3 per cent. The chief city is Providence (q.v.) which (1915) had a population of 250,025; other cities are Pawtucket, 58,156; Woonsocket, 43,355; Newport, 29,631; Warwick, 29,431; Central Falls, 25,171; Cranston, 25,201; East Providence, 17,741. The urban population is 96.8 per cent of the whole. In 1916 there were 14,622 births in the State, 5,727 marriages and 9,512 deaths. The death rate in cities was 16.2 and in rural districts 14.3 per 1,000 of the population.

Education.—Rhode Island has excellent public schools, supported by local taxation and administered by local authority, and under the general supervision of a commissioner of schools. Education is compulsory, and while there is much illiteracy among certain classes of foreigners, parents, almost without exception, show eagerness to have their children educated. In 1916 the school population of the State was 127,479, of whom 76,359 were enrolled in schools. The State Normal School at Providence is a handsome building, and the State also maintains a College of Agriculture and the Mechanical Arts. The leading educational institution of the State, and one of the best in the United States, is Brown University. The Rhode Island School of Design furnishes educational advantages in the arts of the highest order. Since 1914 the minimum school term is 36 weeks. High schools are provided by every town.

Religion.—The First Baptist Church of Providence, said to be the first in America, dates back to 16 March 1639. Roger Williams was one of the organizers. The Quakers were among the early settlers, seeking refuge from persecution in Massachusetts, and the Friends' School at Providence is one of Rhode Island's best-known educational institutions. The Congregationalists did not venture into Rhode Island until 1721, and while their proposal to come there was received with some bitterness by the descendants of those whom their ancestors had driven into the wilderness, they have become one of the leading denominations in

the State. While Roman Catholics were as free to worship in Rhode Island as members of any other creed, it was not until 1813 or 1814 that mass was publicly celebrated in the city of Providence; the church of Saints Peter and Paul was completed in 1838. The present handsome cathedral stands partly on the site of the old church, and the Roman Catholic faith now includes about 275,000, or 46.1 per cent of the entire population of the State. ('Official Catholic Directory' for 1916). The Baptists have almost one-third of the total Protestant church membership, and the Episcopalians, who celebrated in 1872 the 150th anniversary of the old Saint John's Church at Providence, have about one-fifth. The Methodists date back in Rhode Island to 1787, and have a large membership and prosperous churches. The Universalists settled in Providence in 1772, and have since had a prominent share in the religious life of the State, besides having been instrumental in fostering many important public charities. The Presbyterians are increasing in numbers and have flourishing places of worship. Rhode Island contains its proportion of other sects and creeds, including the Jews, who were among the early settlers of Newport, where some of them achieved eminence.

Government.—There are 33 towns and six cities within the State. The governor, lieutenant-governor, secretary of state and other State officers are elected for two years. The governor may exercise the power of veto and can pardon criminals, with the advice and consent of the senate. The members of the legislature, known officially as the general assembly, are elected for two years. In the upper house, called the senate, there is one senator for each city and town. The lieutenant-governor presides over this body. The lower house, or house of representatives, shall never exceed 100 members and no town or city shall have more than one-fourth of the whole number of members. Members of the general assembly are paid for actual attendance, with a maximum limit of 60 days. The house alone has the power to impeach, and the senate tries cases of impeachment.

The judicial power is vested in the Supreme Court and in such inferior courts as the general assembly may from time to time establish. Preliminary examination of persons charged with serious crimes and trials for minor offenses are held in the District Courts, the justices of which are chosen by the general assembly. The justices of the Supreme Court are elected by the general assembly in grand committee and continue in office until their positions are declared vacant by a resolution of the general assembly. In practice this has meant election for life, or until retirement by voluntary resignation. The presidential suffrage was extended to women in April 1917.

History.—The colony originally consisted, as the name indicates, of more than one community of independent origin, but to Roger Williams, the founder of Providence Plantations, history accords the distinction of having established the commonwealth. Providence Plantations was founded in 1636 by Roger Williams, who fled with several companions from Puritan persecution. He was of Welsh origin, and of respectable family, and his arrival in

Massachusetts, 5 Feb. 1631, is recorded as "the coming of a godly minister." Williams soon showed that he had no sympathy with the Massachusetts principle of controlling through the civil government the consciences of men, and he frankly avowed his views in this regard. He thus incurred the censure of the Puritan magistrates and it was at first resolved to expel him from the colonial bounds, and when it was learned that he proposed to found another colony, it was determined to send him back to England. Williams received timely warning of this intention and he fled into the wilderness with several companions, and at the opening of spring in 1636 he began to plant on the east side of the Seekonk River. He had five companions, William Harris, John Smith, Francis Wickes, Thomas Angell and Joshua Verin. Here he was allowed to rest, being notified by Plymouth Colony that the place was within their jurisdiction. Some time between the end of April and the latter part of June 1636 he proceeded around what is now Fox Point and up Providence River, landing at the site of the future town, and here he selected a dwelling-place for himself and his associates. His object, as set forth by himself, was "the settling of the plantation, and especially for the receiving of such as were troubled elsewhere about the worship of God."

The settlement of Rhode Island was at first a separate colony, but it also owed its origin to the example and advice of Roger Williams. John Clark and others of Boston went to Providence in 1638 in search of an asylum where they might enjoy liberty of conscience. Roger Williams advised them to purchase from the Indians the large island on the east side of Narragansett Bay called by the Dutch "Roode Eylandt." This was done, and the adventurers, 18 in number, incorporated themselves as a body politic and elected William Coddington their chief magistrate. A third settlement was formed at Warwick in 1643 by a party of whom John Greene and Samuel Gorton were leaders.

Roger Williams perceived that the union of the weak settlements and the protection of the home government were necessary for their protection from the hostile and comparatively powerful Puritans, and in 1643 he went to England and brought back in the following year a charter which united the settlements of Providence and Rhode Island under one administration, the name of the colony being Rhode Island and Providence Plantations. The new government went into operation in 1647, when the freemen of the several plantations met at Portsmouth, 19 May, and adopted laws for carrying on the civil government. This charter was confirmed by Cromwell in 1655, and in 1663 Charles II granted the celebrated charter which remained for 180 years the supreme law of Rhode Island, both as colony and State, and gave place to a State constitution in 1843 only after the civil convulsion known as the Dorr Rebellion gave notice that the people were determined upon a change.

The colony suffered greatly in the war with King Philip. Providence was burned, and the outer settlements were laid waste and settlers murdered. The Great Swamp Fight, on Rhode Island soil, broke the power of the hostile Indian confederacy, and when King Philip was

RHODE ISLAND

1 The State House, Providence

2 The Old Stone Mill, Newport

slain by treachery in the fastnesses of Mount Hope, the red men ceased to be a menace to the security of the settlements.

When Sir Edmund Andros was made governor of New England by James II he sought to take away the colonial charters, and in 1687 attempted to seize that of Rhode Island, but in some mysterious manner it disappeared and was not found until the accession of William and Mary in 1689. Roger Williams had died in 1683. Notwithstanding the harsh treatment he had received from the authorities of Massachusetts he was ever ready to use his influence with the Indians in behalf of the colonies, and he was instrumental in disarming Indian hostility at times when the colonists were ill-prepared for defense. Although a strong controversialist and bold and unsparing in his denunciation of those with whom he did not agree, he had a remarkable faculty of commanding the affection and esteem of men, as was signally shown in his ability to obtain for his colony the protection alike of Cromwell and of Charles II. He was exemplary in his private life and altogether worthy of the reverence which posterity, without regard to creed, attaches to the memory of him whom Whittier has truly called "soul-freedom's brave confessor." He imprinted on Rhode Island a character which it has never lost, and which has been handed down through all the varying changes of population, of liberality and tolerance, of the Sermon on the Mount interpreted in the ordinary every-day actions of men.

The colony grew with a steady and wholesome growth and religion flourished, although unsupported by the compulsory contributions of worshippers. The people were engaged in agriculture and commerce, and, in times of war, in privateering. During the struggle between Great Britain and France for empire in North America, Rhode Island took an active share in supplying troops and seamen, and the colony had 50 privateer vessels, manned by 1,500 sailors, at sea in 1756. The passion for privateering, with its excitement, its tests of courage and endurance and prospects of rich reward, became so strong that when Esek Hopkins was commander-in-chief of the Continental navy, with his vessels at Providence, he found it impossible to man them, owing to the fact that privateering offered better inducements. The coast of the colony was infested with pirates in the early part of the 18th century, and some 30 of these ocean highwaymen were hanged at one time at Newport.

It was difficult in earlier years to obtain men to fill the minor public places, and laws were passed which remained on the statute-books for many years, providing penalties for refusal to accept office. This modesty on the part of the forefathers is easier to understand in view of the fact that the expenses of the town of Providence at the outbreak of the Revolution did not exceed \$1,000 a year.

The people of Rhode Island were among the foremost in defending American rights against the aggressions of George III and his ministers. In June 1772 a band of volunteers commanded by Abraham Whipple, who had distinguished himself as captain of a privateer in the wars against the French, burned the British revenue schooner *Gaspee* in Narragansett Bay. During the greater part of the War of Independence

Newport was occupied by the British, and on 29 Aug. 1778 a severe engagement was fought between the Americans, under Sullivan, and the British at Butt's Hill, R. I., in which the British suffered the greater loss. During the war the State furnished nearly 12,000 enlisted men.

Rhode Island was the last of the States to ratify the Federal Constitution, its assent not having been given until 29 May 1790, more than a year after the national government had gone into operation. As a small State, Rhode Island was peculiarly jealous of its rights, and was slow to assent to its adoption. As the Constitution was first formulated and adopted by some of the original States there was room for a well-grounded fear that the smaller States might be destroyed and absorbed through combinations of their more powerful neighbors. It was this fear mainly that caused Rhode Island to stand aloof from the combination, and it was not until that fear had been allayed by amendment to the original instrument that its adoption by the State was effected.

For some years after the Revolution the shipping of the State, being free from British restriction, became known in all parts of the globe then visited by vessels, and the foundations were laid of large fortunes afterward invested in manufacturing, when the shipping business declined. This change took place early in the 19th century, when New England's foreign commerce was practically ruined by the embargo, and when, on the other hand, the War of 1812 gave an impulse to domestic manufactures. Factories were established on every stream that afforded water-power, and Rhode Island grew in prosperity with her expanding industries.

The charter of Charles II, which continued to be the fundamental law of the State, restricted the right of suffrage to freeholders having an estate worth \$134, or renting for \$7 a year, and to their eldest sons. This was the cause of many wrongs, and of widespread popular protest. It was not uncommon for persons holding mortgages to threaten to foreclose them in order to influence votes, and the system gave rise to much intimidation and corruption. The conservative element strongly opposed a change, and when attempts to obtain reform through the regular course of legislation failed, representatives of the suffrage reform party met in convention and framed a constitution. They claimed that this constitution had been adopted by a majority of the adult male citizens of the State, and it was also alleged that a majority of those entitled to vote under the King Charles charter had voted in favor of the constitution. State officers and a legislature were chosen under this constitution, and organized with Thomas W. Dorr as governor. The charter officials, under Gov. Samuel W. King, ignored the Dorr legislature and its enactments, and Governor King, at the head of a military force, dispersed the so-called insurgents. Dorr was convicted of treason and sentenced to imprisonment for life, but he was released some years later, and his sentence ordered expunged from the records of the State. A new constitution was adopted in regular form, and went into effect in May 1843. It retained the real estate qualification for foreign-born citizens, and this was not abolished until 1888.

Another important change adopted later was that permitting election by a plurality vote. This came into effect in 1893. When a majority was required the election was often thrown into the general assembly, which sometimes chose a minority candidate. Until 1900 the State had two seats of government, the organization of the State government and one session of the legislature being held at Newport in May. Now all sessions are held in Providence, in the splendid new State Capitol.

As a manufacturing State, Rhode Island has been largely influenced by tariff interests in its attitude on national elections, and since 1856, with one exception, the year 1912, it has always given its electoral vote to the Republican candidates. The Democrats have been successful several times within the past two decades, however, in electing their candidates for governor. Rhode Island has adopted the so-called Australian ballot system of secret voting.

Political power is unequally divided. Each city and town, no matter how large or small, has but one representative in the senate, or upper branch of the general assembly, and the representation is also disproportionate in the lower branch. The city of Providence, with nearly one-half the population of the State, and contributing nearly one-half of the State taxes on general property, elects only about one-eighth of the State legislature. In this respect Rhode Island is a miniature of the national government. It is also a singular fact that in Rhode Island's civil conflict, the Dorr "war," the northern part of the State chiefly supported one side, the Dorrites and the southern part stood by the charter.

In the Civil War, Rhode Island supplied 24,102 men for both the army and navy, Gen. Ambrose E. Burnside, for a time in command of the army of the Potomac, and whose equestrian statue is a conspicuous feature of the city of Providence, joined the service from this State, of which, however, he was not a native, and later was honored by its people by being elected governor and United States Senator. Rhode Island spared no expense in sending troops to the front, and since that great conflict has been generous in caring for her disabled and dependent defenders, and maintains a well-regulated Soldiers' Home at Bristol. The Soldiers' Monument opposite the City Hall in Providence, one of the finest in the United States, bears the names of the gallant dead who fell in defense of their country. In the Spanish-American War, the conflict in the Philippines and in the Mexican crisis and the late great World War Rhode Island has been well represented. See BOUNDARIES OF THE UNITED STATES.

GOVERNORS OF RHODE ISLAND.

The State originally consisted of four towns, Providence, settled in 1636; Portsmouth, in 1638; Newport, in 1639, and Warwick, in 1642. The executive heads of Portsmouth and Newport were entitled judges, until 1640, when these two towns were united, and the chief officer was thereafter called governor. Providence and Warwick had no executive head until 1647.

PORTSMOUTH

William Coddington, judge.. 7 March 1638-30 April 1639
William Hutchinson, judge.. 30 April 1639-12 March 1640

NEWPORT

William Coddington, judge.. 28 April 1639-12 March 1640

PORTSMOUTH AND NEWPORT

William Coddington, governor, 12 March 1640-19 May 1647
In 1647 the four towns were united under a charter or patent granted in 1643 by Parliament.

PRESIDENTS UNDER THE PATENT

John Coggeshall..... May 1647-May 1648
Jeremy Clarke¹..... May 1648-May 1649
John Smith..... May 1649-May 1650
Nicholas Easton..... May 1650-Aug. 1651

In 1651 a separation occurred between the towns of Providence and Warwick on the one side, and Portsmouth and Newport on the other.

¹ William Coddington, of Newport, was elected, but the General Court would not engage him, for failing to clear himself of certain accusations.

PROVIDENCE AND WARWICK

Samuel Gorton..... President. October 1651-May 1652
John Smith..... May 1652-May 1653
Gregory Dexter..... May 1653-May 1654

PORTSMOUTH AND NEWPORT

John Sanford, of Portsmouth..... President. May 1653-May 1654
In 1654 the union of the four towns was re-established.

Nicholas Easton. President. May 1654-12 Sept. 1654
Roger Williams..... Sept. 1654-May 1657
Benedict Arnold..... May 1657-May 1660
William Brenton..... May 1660-May 1662
Benedict Arnold..... May 1662-25 Nov. 1663

UNDER THE ROYAL CHARTER

Benedict Arnold..... Nov. 1663-May 1666
William Brenton..... May 1666-May 1669
Benedict Arnold..... May 1669-May 1672
Nicholas Easton..... May 1672-May 1674
William Coddington..... May 1674-May 1676
Walter Clarke..... May 1676-May 1677
Benedict Arnold¹..... May 1677-20 June 1678
William Coddington²..... 28 Aug. 1678-1 Nov. 1678
John Cranston³..... 8 Nov. 1678-12 March 1680
Peleg Sanford..... 16 March 1680-May 1683
William Coddington, Jr..... May 1683-May 1685
Henry Bull..... May 1685-May 1686
Walter Clarke⁴..... May 1686-29 June 1686
Henry Bull..... 27 Feb. 1687-May 1690
John Easton..... May 1690-May 1695

¹ Died in office.

² The charter was suspended by Sir Edmund Andros till 1689. The deputy governor, John Coggeshall, acted as governor on the resumption of the charter. Governor Clarke refusing to serve.

Caleb Carr⁴..... May 1695-17 Dec. 1695
Walter Clarke..... Jan. 1696-March 1698
Samuel Cranston⁵..... March 1698-26 April 1722
Joseph Jencks..... May 1722-May 1732
William Wanton⁶..... May 1732-Dec. 1733
John Wanton⁶..... May 1734-5 July 1740
Richard Ward..... 15 July 1740-May 1743
William Greene..... May 1743-May 1745
Gideon Wanton..... May 1745-May 1746
William Greene..... May 1746-May 1747
Gideon Wanton..... May 1747-May 1748
William Greene..... May 1748-May 1755
Stephen Hopkins..... May 1755-May 1757
William Greene⁴..... May 1757-22 Feb. 1758
Stephen Hopkins..... 14 March 1758-May 1762
Samuel Ward..... May 1762-May 1763
Stephen Hopkins..... May 1763-May 1765
Samuel Ward..... May 1765-May 1767
Stephen Hopkins..... May 1767-May 1768
Josias Lyndon..... May 1768-May 1769
Joseph Wanton..... 1769-7 Nov. 1775, Depos
Nicholas Cooke..... Nov. 1775-May 1778
William Greene..... May 1778-1786
John Collins..... May 1786-1790
Arthur Fenner, Federal-
publican..... May 1790-15 Oct. 1805⁴
James Fenner, Federal-
publican..... May 1807-1811
William Jones, Federal-
publican..... May 1811-1817
Nehemiah R. Knight,⁴ Fed-
eral-Republican..... May 1817-9 Jan. 1821

⁴ Died in office.

⁵ Paul Mumford, governor, died in office. Henry Smith first senator, officiated as governor. In 1806 no election governor, Isaac Wilbour, lieutenant-governor, officiated.

⁶ Elected United States senator, 9 Jan. 1821, for unexpired term of James Burrill, Jr., deceased.

William C. Gibbs, Federal- Republican.....	May 1821-1824
James Fenner..... Whig...	May 1824-1831
Lemuel H. Arnold.....	1831-1833
John Brown Francis.....	1833-1838
William Sprague.....	1838-1839
Samuel Ward King.....	1840-1843

⁷ In 1832, no election of governor, lieutenant-governor, or senators. Elections were successively ordered for 16 May, 18 July, 28 Aug. and 21 Nov. 1832, resulting without choice. At the January session, 1833, the officers who had not been re-elected in 1832 were continued in office until the next session.

⁸ In 1839, no election of governor or lieutenant-governor. Samuel Ward King was first senator and acting governor.

UNDER THE CONSTITUTION (ADOPTED IN 1842)

James Fenner..... Whig.....	1843-1845
Charles Jackson.....	1845-1846
Byron Diman.....	1846-1847
Elisha Harris.....	1847-1849

Chas. Dean Kimball.....	16 Dec. 1901-1903
Lucius F. C. Garvin, Democrat.....	1903-1905
George H. Utter..... Republican.....	1905-1907
James H. Higgins..... Democrat.....	1907-1909
Aram J. Pothier..... Republican.....	1909-1915
R. Livingston Beekman.....	1915-1921

⁹ Resigned 20 July 1853, having been elected United States senator, May 1853. Francis M. Dimond, lieutenant-governor, officiated.

¹⁰ Governor Sprague resigned 3 March 1863, to accept the office of United States senator; and Lieutenant-Governor Arnold having been previously elected to the Senate of the United States to fill the vacancy caused by the resignation of James F. Simmons, Mr. Cozzens became governor by virtue of his office as president of the State senate.

¹¹ William Gregory was re-elected governor 5 Nov. 1901, but died 16 Dec. 1901, and Lieutenant-Governor Kimball became governor.

EDWARD FIELD,

Author of 'The State of Rhode Island.'

RHODE ISLAND, an island belonging to the State of Rhode Island, at the entrance to Narragansett Bay. It is separated from the mainland on the west by the estuary, Sakonnet River, and is the largest island in the bay. The State was named after this island. It is about 15 miles from north to south and three and one-half miles wide. It is divided into three townships: Newport, Portsmouth and Middletown. It is a famous summer resort. Newport (q.v.), the city, is on the southwest coast.

RHODE ISLAND, Battle of, an engagement which occurred 29 Aug. 1778. The British had seized Newport and garrisoned it with 6,000 men under Pigott. An attack was concerted by Sullivan and Lafayette on land and Count d'Estaing on sea. Sullivan seized Butts' Hill on the island of Rhode Island. Estaing was obliged to meet Howe and the English fleet, but battle was prevented by a fierce storm, and Estaing withdrew to Boston to refit. Pigott attempted (29 August) to carry Butts' Hill, and a bloody repulse of the British resulted; but on the arrival of Clinton with 5,000 reinforcements the Americans were compelled to evacuate the position.

RHODES, rōdz, Cecil John, South African financier and statesman: b. Bishop's Stortford, Hertfordshire, England, 5 July 1853; d. Cape Town, 26 March 1902. He was educated at the grammar school of his native town, but before he could pass on to the university a serious affection of the lungs necessitated his departure for Natal, where an elder brother of his was engaged in cotton-raising. Rhodes landed in South Africa in 1870 and after a brief experience in farming made his way to the diamond fields of Kimberley, where he met with speedy and astonishing success. At 19 he was a millionaire and, with his health well recovered in the salubrious air of the veldt, he planned to return to England to resume his interrupted education. Before leaving South Africa he traveled for eight months, by ox-cart and on foot, through the region north of the Orange and the Vaal, and his imagination, which even at that early age worked in vast spaces, saw in the fertile, thinly populated country virgin soil for the building up of an imperial Britain in the Dark Continent. He matriculated at Balliol College, Oxford, in 1873, but his ailments returned and he was compelled to leave England in the same year. Three years in South Africa made him robust again and from 1876 on he kept his terms at the university, spending the long vacations in South Africa, and taking his B.A. and M.A. in 1881. In the same year Rhodes entered the Cape Parliament as member for Barkly West. By this time his plans for

the future had assumed a definite character. Convinced, at all times, of the supreme fitness of the English race for the task of governing the world, Rhodes made it his object in life to further the realization of that end in his own especial sphere of South Africa. To aid him in his schemes he looked to money, in whose power he had a tremendous faith, and it is because of the close connection in him of the selfish money-getting instinct and the broad ambition of the statesman that Rhodes remained for many years an enigma to the world. In the Cape Parliament Rhodes devoted himself to the task of establishing harmonious relations between the English inhabitants and the Dutch, for with true insight he recognized that if British influence was to dominate South Africa it must be conditioned by the goodwill of the people of Dutch blood. The first step in his scheme of imperial expansion was the acquisition of Bechuanaland as a British protectorate in 1884. For this he labored against the indifference of the home government, which he finally stirred to action by his insistence upon the necessity of securing Bechuanaland as an outlet for the British trade to the north, already threatened by the encroachments of the Transvaal from the east and Germany from the west.

The annexation of Bechuanaland was a victory for Rhodes over Kruger, the astute President of the Transvaal, but the struggle between the two did not end there. When Boer commanders began to cross the Limpopo River, the northern boundary of the Transvaal, about 1887, Rhodes, to cut off their advance in that direction, obtained from Lobengula, king of the Matabele who were masters of the country between the Limpopo and the Zambesi, the exclusive right to search for minerals within his territories, and in 1889 the British South Africa Company was incorporated with almost absolute political and territorial powers over a vast, indefinite tract north of the Limpopo. In 1890 settlers were brought into the country and founded Fort Salisbury in Mashonaland, and at the same time the construction of a railway was begun which, running entirely through British territory, was to connect the new settlements with the Cape. Reading his title to Rhodesia, as the country was soon called, in liberal terms Rhodes (after 1893) extended the operations of the company north of the Zambesi as far as to the southern end of Lake Tanganyika, and though his dreams of an "all red" map of Africa had been dissipated by the convention of 1889 with Germany, which allowed that country to stretch a barrier across the continent to the Kongo State, he did not abandon his scheme of a transcontinental telegraph line from north to south and a railway "from Cape to Cairo." Upon his political projects Rhodes spent vast amounts of money, partly his own, partly the funds of the De Beers Consolidated Mines, a corporation formed by him in 1888 and controlling the entire diamond output of the famous Kimberley mines. Of this company he was managing director.

In 1890 Rhodes became Premier of Cape Colony. During his six years of office he gave special attention to his old policy of amalgamation between Dutch and British; he succeeded in winning the confidence of the former by his strong advocacy of full local government for

Cape Colony, which he considered quite consistent with, and indeed, essential for, the scheme of imperial federation. It is this belief in a federal union of locally autonomous commonwealths that explains his gift of £10,000 to the funds of the Irish Home Rule party in 1888. In his treatment of the native races of Cape Colony, Rhodes maintained the impossibility of granting them equal rights with the white population, but at the same time held it necessary to protect them by law against the temptations of civilization and exploitation by the whites. In Rhodesia a formidable outbreak of the Matabele in 1893 ended, after a bitter conflict, in their utter defeat and the absorption of their territory by the Chartered Company. Successful everywhere, however, Rhodes was destined to fall before his old opponent, Kruger, of the Transvaal. The Jameson raid in 1895 destroyed Rhodes' personal power, although subsequent events fully vindicated his policy. Though the full truth of the Jameson affair may not perhaps be known, it is established that Rhodes, who was a large holder of mines in the Rand, plotted with other leaders of the Uitlanders in Johannesburg for the subversion of the Transvaal government; that a revolution was prepared in Johannesburg, and that Rhodes stationed Captain Jameson with several hundred men of the Rhodesian mounted police on the western border of the Transvaal to co-operate when necessary with the leaders in the mining town; and though it is also established that Jameson invaded the Transvaal without Rhodes' orders, the results of that unhappy affair were not altogether unjustly reckoned up against the Premier of Cape Colony who abused the powers of his office to plot the downfall of a nation, when conservative methods interfered with his dominating ideas for imperial advancement (see JAMESON, LEANDER STARR). A committee of the House of Commons acquitted Rhodes of responsibility for the raid, but censured his conduct as Minister and director of the Chartered Company. Rhodes resigned the premiership on the last day of 1895 and thenceforth devoted himself to the interests of Rhodesia. A second war with the Matabele in 1896 was terminated by Rhodes' intrepid courage; the building of the trans-continental railway was rapidly pushed forward, and in connection with this undertaking Rhodes visited Europe in 1898-1900, carrying on negotiations with Mr. Chamberlain, the Colonial Secretary, and with the German emperor. During the Boer War, in its outcome the triumph and realization of his policy, Rhodes was besieged in Kimberley and took part in its defense. His health, however, gave way, and in spite of a trip to Egypt, his old disease finally conquered. In his lifetime Rhodes was the subject of infinite execration, as well as unlimited applause. Looked upon by different men as a statesman or a land grabber, a builder of empires or an unscrupulous speculator, he was all of these and more; and the anomaly of his character may, perhaps, be best explained if he be regarded as a man of great aims who let nothing stand in the way of their achievement. He bequeathed the bulk of his great fortune for the endowment of a large number of scholarships at Oxford University, with the intention to bring about the complete union of the English speaking races for the peace, enlight-

enment and uplift of humankind (see RHODES SCHOLARSHIPS, THE). Consult Fuller, G. E., 'Cecil John Rhodes' (New York 1910); Hensman, H., 'Cecil Rhodes: A Study of a Career' (Edinburgh 1901); Jourdan, P., 'Cecil Rhodes: His Private Life' (New York 1911); Le Sueur, H., 'Life of Cecil Rhodes' (New York 1913); Michell, L., 'The Life and Times of the Right Honourable Cecil John Rhodes' (2 vols., New York 1910); Radziwill, Princess Catherine, 'Cecil Rhodes: Man and Empire Maker' (New York 1918); Stead, W. RHODES, James Ford, American historian: b. Cleveland, Ohio, 1 May 1848. He studied at the University of the City of New York and also at Chicago University, his courses being principally confined to history, literature, rhetoric and metaphysics. In 1867 he went to Paris and attended lectures at the Collège de France following which he pursued a course in metallurgy at the School of Mines in Berlin, and made a tour of inspection through the iron and steel works of Germany and Great Britain. He was Paris correspondent of the *Chicago Times*. In 1870 he entered his father's iron business in Cleveland and became a member of the firm in 1874. Having acquired sufficient wealth to enable him to adopt a literary career, he retired from business in 1885, and began the preparation of his 'History of the United States from the Compromise of 1850.' In 1891 he took up his residence at Cambridge, Mass., and the next year the first two volumes of his work were published. It was completed in 1906 with the publication of the seventh volume. It is the most authoritative work on the period with which it deals; is impartial; fair to all; but lacks literary grace. The Loubat prize was awarded him by the Berlin Academy of Sciences in 1901. Mr. Rhodes is also the author of 'Historical Essays' (1909); 'Lectures on the American Civil War,' delivered at Oxford University (1913) and 'History of the Civil War' (1917). He was awarded the gold medal of the National Institute of Arts and Letters in 1910 and is an ex-president of the American Historical Association.

RHODES, an island of Turkey, in the Aegean Sea, near the southwest coast of Asia Minor, from which it is distant about 11 miles. It lies between lat. 35° 52' and 36° 28' N., and long. 27° 40' and 28° 15' E., is about 45 miles long and 25 miles broad, and has an area of about 424 square miles. The island is crossed from north to south by a high mountain range which attains its extreme elevation in the peak of Atairo, the ancient Atabyron, with an altitude of 4,070 feet. Hills of a lower level traverse the island in all directions and are covered with coniferous trees, the considerable remnants of once splendid forests. Along the many mountain streams tropic plants grow in abundance, chief among them myrtles, oleanders and cactus. The soil is fertile and on the hillsides and in the valleys and plains, vines and olives, figs, pomegranates and oranges are grown. Wheat of an excellent quality is also raised, but not in sufficient quantities to form a commodity of export. Rhodes has been famous since ancient

times for the mildness of its climate and its salubrious air. The winds show little variation. The value of the foreign commerce is about \$1,000,000, the chief articles of export being sponges, oil and fruit, and the chief imports cotton goods and textiles. There is regular communication by English, French and Austrian steamship lines. The island forms a *sanjak* or district of the Turkish province of the Isles of the White Sea, and its capital, Rhodes (q.v.), is the seat of a pasha. The population is placed at 30,000 of whom two-thirds are Greeks, about 7,000 Mohammedans and 2,500 Jews.

The original inhabitants of Rhodes are unknown, but at the dawn of history the island was inhabited by a mixture of races from Asia Minor, and Phœnicians, the latter of whom seem to have come from Crete. In the earliest period of Hellenic migrations Rhodes was overrun by the Dorians who founded the cities of Lindus, Ialysus and Kamiros, the sites of which may still be identified. These cities with the three Dorian cities on the mainland, Cos, Cnidus and Halicarnassus, constituted the so-called Dorian Hexapolis whose common shrine was the temple of Apollo Triopis on the Carian coast. The sun-god was at all times the favorite deity of the island and from one of his most common emblems, the rose, its name (*rhodos* in Greek, "rose") is said to be derived. The Rhodians were among the most enterprising traders in the Mediterranean and their colonies were found in Spain, in southern Italy and Sicily, and on the southern coast of Asia Minor. In 408 B.C. the inhabitants of the three ancient towns abandoned their homes and joined to form the new city of Rhodes (q.v.) which from now on was the capital of the island. The foundation of Rhodes exercised a tremendous influence on the development of the trade of the island. In the Peloponnesian War, Rhodes sided with Athens until 412 B.C., when it went over to Sparta. In 394 B.C., however, it returned to the Athenian allegiance. Occupied by the Macedonians during Alexander the Great's lifetime, it revolted after his death and defended its independence with splendid success against Demetrius Poliorcetes in 304 B.C. The island was now at the very height of its power; its commerce attained an unprecedented development and by means of its strong navy it made itself master of a strip of territory on the Asiatic mainland. The Athenian orator Æschines (q.v.) established a noted school of oratory in the city of Rhodes, which also became a great centre for the arts, especially sculpture, and one of the leading university towns of the Roman world. Early in the 2d century B.C. Rhodes became an ally of Rome and enjoyed its favors. In 42 B.C. it was plundered by Cassius because it sided with Julius Cæsar, and in 44 A.D. it was united to the province of Asia. In 661 the island was taken by the Arabs, but was recovered by the Byzantines who in 1310 gave it over to the Knights of Saint John. The latter held it against the Turks until 1522, when it was taken by Solymán II, and has since remained under Turkish domination. The island is subject to earthquakes, in modern times those of 1851 and 1856 being especially disastrous.

RHODES, or **KASTRO**, a town and the capital of the island of the same name, situated at its northeastern extremity. The modern

town is of much smaller extent than the ancient city, but is still of imposing appearance. It is built in the form of an amphitheatre and is surrounded by walls and a ditch dating from the time of its occupation by the Knights of Saint John, the memorials of whom constitute the most interesting features of the town. Among these are the hospital, the palace of the grandmaster and the cathedral of Saint John, the latter two in a ruinous condition. The streets are tortuous, the most picturesque being the Knights' street, which has preserved its mediæval appearance. The town has three ports, the one to the north, the central and the southeast port; of these the central port is the only one practicable, but is in part choked up with sand. Near the harbor in ancient times stood the famous Colossus (q.v.). The population is about 11,500, mostly Turks and Jews.

RHODES, Colossus of. See **Colossus**.

RHODES, Law of, a code of maritime laws adopted by the people of Rhodes (q.v.) about 900 B.C., after their naval victories and their practical sovereignty of the sea. A later collection, known as "Rhodian Sea-Law," is generally believed not to have been the original maritime code of Rhodes and to have been put together some 1500 to 1700 years later, or from 600 to 800 A.D., by some private individual. The maritime law of Rhodes is of very considerable importance because of the fact that the Romans borrowed much from it in the compilation of their own maritime laws and in their observances of the rules governing the sea. It has, therefore, indirectly influenced modern maritime law. See **MARITIME LAW**.

RHODES-GRASS, a newly-introduced species, is a native of central and southern Africa, where it is regarded as one of the best species for pastures on dry soils. It is a perennial, growing from three to four feet high, with a large number of very long, narrow and tender leaves and with rather few branching stems.

When grown from seeds its growth is commonly erect the first season, but when grown from roots, or the second season when grown from seed, it makes runnerlike branches two to four feet long, which root at the joints and so cover the ground quite rapidly.

It is propagated by both seed and roots. When seed is used it should be sown at corn-planting time at the rate of about 10 pounds per acre on a soil having a fine mellow surface and then given a light harrowing. As the seed is produced only in small quantities and as it continues to be developed and matured through the entire season, little of it can be gathered at any one time; consequently the grass is more commonly propagated by roots. The roots may be planted in well-prepared land at any time from February to July, putting them two to four feet apart and protecting them from grazing until they become well established. This grass has been introduced so recently that seed is still scarce on the market.

While the principal value of the grass is for grazing it is also used for hay, giving two or three cuttings of about one ton each per acre. The hay is of excellent quality. It bears severe drought and moderate frost without injury, but is easily killed by plowing late in the season. It is not recommended for cultivation

except in the southern part of the Gulf States. Rhodes-grass is especially promising for the semi-arid regions of the extreme Southwest, where the temperature does not fall below 20° F.

RHODES SCHOLARSHIPS, The. The system of scholarships founded by the will of Cecil John Rhodes (q.v.), which provided in perpetuity for the support at Oxford University, for a term of three years each, of about 176 selected scholars from the British colonies, the United States and Germany. The scholarships were apportioned as follows: Rhodesia, 9; Cape Colony, 12; Natal, 3; Australia, 18; New Zealand, 3; Canada, 6; Newfoundland, 3; Bermuda, 3; United States, 2 for each State and Territory; total, 104; Germany, 15. The scholarships have an annual value of £300 (\$1,500) and are intended to bring about complete unity of the English-speaking race. The German scholarships of £250 (\$1,250) were added as ex-Kaiser Wilhelm II had "made instruction in English, compulsory in German schools." Owing to Germany's action in the European War, an act was passed in 1916 canceling the German scholarships and allotting them to Alberta, Saskatchewan, the Transvaal, the Orange Free State and to the towns of Kimberley and Port Elizabeth, alternately. Appointments to Rhodes scholarships were postponed during the war and were resumed in 1919.

As already stated the Rhodes will provides for two scholarships constantly at Oxford from each State in the Union. Each scholar stays three years and receives a stipend of \$1,500 a year, out of which he pays his tuition, fees and expenses, exactly as any other student. There are no restrictions as to the subjects which he should study; Rhodes scholars may take any of the various Oxford Honor Schools or, if prepared, may work for the Oxford research degree of B.Litt., B.Sc., B.C.L. or Ph.D. Candidates must be unmarried, between the ages of 19 and 25 and must have completed at least their second year in college. Candidates may try for the appointment either from the State in which they reside or from that in which they have received the major part of their education. The qualifying examination which was required of all candidates for Rhodes scholarships in the past has been abandoned and it is only necessary for candidates to make formal application, endorsed by the authorities of their college or university. The selections are made on the basis of a man's record in school and college, according to the four points outlined in the Rhodes will: (1) Scholarship, (2) character, (3) interest in outdoor sports and (4) interest in one's fellows and instincts for leaderships.

The selections are made by committees in each State constituted for that purpose.

RHODESIA, rō-dē'zī-ā, South Africa, a British possession colonized in the last quarter of the 19th century by the British South African Company, founded by Cecil John Rhodes (q.v.), after whom it is named. It is bounded on the north and northwest by the Kongo Free State, on the west by Portuguese territory and Bechuanaland, on the south by Bechuanaland and the Transvaal, on the east by Portuguese territory and the British Central Africa Protectorate and on the northeast by German East

Africa. Total area, about 750,000 square miles. The river Zambesi, which traverses it from west to east, divides it into the two portions called Southern and Northern Rhodesia. Southern Rhodesia (area, 174,728 square miles) consists of the two former districts of Mashonaland, capital, Salisbury, and Matabeleland, capital, Buluwayo. Northern Rhodesia is divided into two parts under separate administrators, namely, Northeastern Rhodesia, headquarters, Fort Jameson, and Northwestern Rhodesia, headquarters, Lialui.

The river Limpopo forms the southern boundary and the Matoppo Hills and their northeastern continuations from the watershed between the basins of the Zambesi and the Limpopo. Of the tributaries flowing north to the Zambesi, the most important are the Shangani, Umfuli and Panyame; and of those flowing south to the Limpopo the Buby, Tuli, Shashi and Macloutsie. The whole country is a plateau varying in elevation from 3,500 to 5,000 feet above sea-level, and in Southern Rhodesia there are numerous mountain ranges, of which the chief is that of the Matoppo Hills already mentioned, Rhodes' burial-place. Of the individual peaks Mount Hampden near Salisbury, Hartley Hill, Mount Wedza near New Umtali and Mount Inyanga are the best known. There appear to be no lakes of any importance apart from the great lakes on the frontiers of Northern Rhodesia (Tanganyika, Moero, etc.). The prevailing rock-formations are granite and metamorphic rocks, and rounded, projecting knobs of granite, often of fantastic appearance, form a striking feature in the scenery of many districts. The climate in the higher parts of the country is generally suitable for Europeans, but in the lower swampy parts and some of the river valleys malaria is prevalent, and the tsetse fly commits great ravages among cattle and horses. The area above 3,000 feet in Southern Rhodesia, most of which is adapted for the residence of Europeans, is stated at 100,000 square miles, and above 4,000 feet, where European children can be reared, there are 26,000 square miles. The summer season, from December to April, is characterized by great heat during the day and heavy rains, but during the rest of the year the weather is generally dry and much colder, especially in June and July. At Salisbury the mean July temperature is 57.5° F., the mean January temperature 70.5° F., and the extremes for the year are about 34° and 93°. The annual rainfall is about 33.8 inches and falls on some 75 days. The soil in many parts is fertile, and the ordinary cereals, vegetables and fruit-trees of Europe can be grown, in addition to the native crops of rice, tobacco, india-rubber and cotton. Extensive tracts of land furnish excellent pasture. Gold has been worked in Southern Rhodesia from ancient times, and there are striking remains at Zimbabwe (near Victoria) and elsewhere, of the works erected by the early miners. At the present time little, if any, alluvial gold is found, but quartz-reefs are being worked with more or less success in various parts of the country, especially around Gwanda, Buluwayo, Gwelo, Sebakwe, Victoria, Umtali, Mazoe, Salisbury, Hartley Hill, Lo Magonda, Abercorn and Selukwe. The total output of gold for the year 1900-01 was 106,783

ounces, valued at \$1,919,900. Coal, iron, copper, silver, tin, plumbago and kieselguhr have also been reported, and some of them are being worked. Southern Rhodesia is being rapidly opened up by means of railways, telegraphs and roads. Buluwayo is in direct railway communication with Cape Town, 1,360 miles, and in 1899 the line from Salisbury to the Portuguese coast at Beira was opened for traffic. A line to connect Salisbury with Buluwayo is rapidly approaching completion and other subordinate lines have been projected or begun.

The whole of Rhodesia, together with the treeless plain of Barotseland on the northwest, acquired in 1899, is under the administration of the British South Africa Company, which was incorporated by royal charter in 1889. Southern Rhodesia, however, is more directly under the control of the imperial government. The administration is carried on in accordance with the company's charter as amended by order in council of 1894 and 1898. The senior administrator, with headquarters at Salisbury, has an administrative council of six members and a legislative council of 10 members, the latter including two elected representatives of each of the two great divisions of the province. The enactments of these councils are subject to the approval of the high commissioner for South Africa, who acts through a resident commissioner. Jury trial was introduced in 1899. There are resident magistrates and judges, from whom an appeal lies to the Supreme Court of Cape Colony and thence to the Judicial Committee of the Privy Council. Salisbury and Buluwayo have a regular municipal government, and doubtless this will be extended in time to the rising towns of Umtali, Gwelo, Tuli, Tati, Victoria, Wankie, Melssetter, Enkeldoorn, Charter, Gwanda, etc. The revenue in 1901-02 was \$2,176,200 and the expenditure \$3,552,800. The total native population of Southern Rhodesia is estimated at 510,000. The white population of Southern Rhodesia was about 11,300; of Northeastern Rhodesia, 164.

The chief tribe of original native inhabitants is that of the Mashonas, a peaceful and industrious race. In 1836 a Zulu people, known as Matabele, invaded the country under a chief called Mosilikatse, and easily conquered the indigenous inhabitants. For more than 50 years this warlike race held undisputed sway in Southern Rhodesia, and appear to have grievously oppressed the subject peoples, but in 1890 an expeditionary force equipped by the British South Africa Company occupied Mashonaland without opposition and founded the town of Salisbury. The Matabeles were for a time left undisturbed, but in 1893 their raids into Mashonaland gave the company an opportunity of extending its authority. Three columns, one of them assisted by subjects of Khama, chief of the Bamangwato, advanced from the northeast, the east and the southwest, respectively, upon Buluwayo, the capital of Lobengula, who had succeeded his father, Mosilikatse, as chief of the tribe. The Matabeles were easily overcome by means of the Maxim machine-guns, and fled to the hills. Toward the end of 1893 Lobengula sent overtures for peace, together with a sum of money, but the fatal cupidity of some men of the Bechuanaland police prevented these from reaching the company's officials. Accord-

ingly the Matabeles who remained around the person of their chief, enraged by the supposed rejection of their overtures, surrounded a small party of Englishmen under Major Wilson, who, unable to escape, fought desperately till all were killed. Lobengula died early in 1894 and all resistance was at an end. Matabeleland has since formed a part of the company's dominion, but a serious native revolt, partly due to the ravages of rinderpest and locusts, broke out in 1896. Mashonaland also revolted about the same time, but both rebellions were peaceably settled by Cecil Rhodes' personal influence over the natives. Consult Bent, J. T., 'The Ruined Cities of Mashonaland' (London 1893); Darter, A., 'The Pioneers of Mashonaland' (London 1914); Fyfe, H. H., 'South Africa To-Day, with an Account of Modern Rhodesia' (London 1911); Hall, R. N., and Neal, W. G., 'The Ancient Ruins of Rhodesia' (London 1902); Heatley, J. T. RHODIAN LAW, an early system of marine law, said to have been compiled by the Rhodians after they had obtained the sovereignty of the sea. The only rule that we know now, though the entire code was adopted by the Romans under Antonius Pius, is the principle of general average: "If a cargo be jettisoned to lighten the ship, all contribute to make good the loss incurred for the benefit of all." The mediæval naval law of the Rhodians was not of Rhodian origin. It consisted of four distinct parts, of very different dates, but mostly of practical value.

RHODIUM, a metal belonging to the platinum group, discovered by Wollaston in 1804. It occurs in small quantities in various platinum ores; is a grayish-white metal; is very hard and infusible, scarcely softening in the flame of the oxyhydrogen blowpipe; and is unaltered in the air at ordinary temperatures, but oxidizes at a red heat. Insoluble in acids, it is readily oxidized by fusion with nitre. The specific gravity of fused rhodium is 12.1; its atomic weight is 103. The compounds of this metal have not been much studied.

RHODOCHROSITE, or **DIALOGITE**, native manganese carbonate. It is usually either cleavable-massive or in rhombohedral crystals of rose-pink or brownish-red color. Its lustre is vitreous to pearly; hardness, 3.5 to 4.5; rhombohedral, cleavage highly perfect. Its most important localities are in Hungary, Germany and Colorado, in which State many magnificent specimens have been found.

RHODODENDRON, a genus of shrubs and trees of the family *Ericaceæ*. About 200 species have been recognized, natives mainly of the cooler parts of the northern hemisphere. They are most numerous in eastern Asia; seven are indigenous to America. They are usually evergreen, have smooth simple leaves and terminal umbel-like racemes of generally very showy flowers for which the plants are widely popular as ornamentals. A few species yield wood which is used in turning and cabinet work, but more largely as fuel; the flowers of others are used in jelly-making, and the leaves of a few have been used medicinally. They are sometimes made to include azalea (q.v.) by some botanists, but are usually considered distinct, the azaleas being generally deciduous. Some species are only a few inches tall, others exceed 50 feet in height, with trunks 18 inches in diameter.

Rhododendrons are readily propagated by seeds, cuttings or layers usually under glass; but choice varieties are most frequently grafted upon seedling stocks. The seeds are very small and are generally sown in seed-pans during early spring in peaty, sandy soil. The seedlings are pricked off as soon as possible; the greenhouse kinds under glass, the hardy ones in cold frames until the following year, when they may be grown in nursery rows. When planted in the garden they should always be protected from heavy wind and the full glare of the sun. The deep shade afforded by walls and hedges is, however, not generally desirable. They do not succeed well as a rule upon limestone, limy or clayey soils, but thrive best upon well-drained, though moist loamy soils underlaid by porous subsoil. Since the roots lie close to the surface no cultivation can be given, but mulching may take its place. Pine needles and marsh or salt hay are specially desirable since they are free from weed seeds. Annual or biennial dressings of well-rotted stable manure should be given. The seed vessels should be cut off when the flowers have fallen, to divert the plant food into new flower buds and to prevent the scattering of seed. The greenhouse kinds require very porous peaty soil, free watering during the summer, careful watering in winter, cold but not frigid quarters for the Himalayan species, and not less than 50° for the Javanese kinds which bloom and grow continuously and require more water also. These last also being epiphytes require still more open soil. They are exceptionally attractive when properly grown.

Among the American species the great laurel (*R. maximum*) is the largest, attaining a height of 30 feet or more. It is indigenous from Nova Scotia to Michigan and southward in the mountains to Georgia. In early summer when its rose or lilac flowers appear in profusion it is an imposing subject and is justly popular as a park specimen. If taken when small from loose soil in the woods it usually transplants well, but nursery-grown plants should be given preference. Though called *maximum*, several of the Asiatic species discovered since this was named are far larger. *R. catawbiense*, a species with lilac-purple flowers often one and one-half inches in diameter, is one of the most beautiful of ornamental shrubs. It rarely exceeds 15 feet. In the mountains from Virginia to Georgia it is very common but in cultivation is well known as hardy in New England.

It is one of the parents of a host of hybrid varieties of remarkable beauty.

R. ponticum, a native of western Asia and the Iberian Peninsula, resembles *R. maximum* but rarely exceeds 10 feet in height. It is considered less hardy than the preceding species, but is widely cultivated, especially in Europe. Several remarkably striking species were discovered by Hooker and other botanists in southern Asia, those of the Khasia Hills being especially noted. Only a few of these, however, have been introduced into cultivation and still fewer have been brought to America. Some have flowers four inches in diameter, others perfumed blossoms and some are epiphytic in their habits. Consult Bailey, 'Standard Cyclopaedia of Horticulture.'

RHODOLITE, a beautiful light red variety of garnet, found only in North Carolina, highly prized as a gem, for which it has been extensively worked and sold within a few years past. The name is from the Greek *rhodon*, a rose, the color resembling some roses and rhododendrons, and, unlike most garnets, becoming extremely brilliant by artificial light. Analysis shows that rhodolite is composed of two molecules of pyrope garnet with one of almandine garnet. It occurs intimately associated with the Cowee rubies (see RUBY) of Macon County, the crystals of the latter sometimes even enclosing the rhodolite. It is one of the most important gem-stones of North Carolina.

RHODONITE, a rose-pink or brownish-red triclinic mineral, essentially a manganese meta-silicate, $MnSiO_3$. It usually contains some calcium and iron, while zinc is present in the variety fowlerite, which occurs at Franklin Furnace and Ogdensburg, N. Y., in groups of magnificent crystals several inches in length. Sweden yields attractive specimens and masses of much beauty associated with braunite are found at Cummington, Mass. Its most important occurrence is near Ekaterinburg, in the Ural Mountains, from which locality the Russians have for many years mined considerable quantities as an ornamental and semiprecious stone, for which purposes it is highly esteemed, being cut into pillars, mantels, table tops, jewel caskets, etc. Its hardness varies from 5.5 to 6.5. Crystallized specimens show an eminent cleavage; the massive forms are exceedingly tough, like jade.

RHODOPE, *röd'ö-pē*, ancient name of a mountain chain (7,474 feet) extending along the borders of Macedonia and Thrace. The Turks call it Dospad Yailasi, the Bulgarians Despoto Dag, both titles having reference to the numerous (Greek) monasteries that stud its sides. Of these the most famous is the vast fortress-monastery of Rilo, in the northwest of the range, standing on its south side in the midst of magnificent pine forests. Rilo has for generations been the focus of the national Bulgarian Church and the mainstay of Bulgarian nationality.

RHONDDA, *rönd'dä*, David Alfred Thomas, Viscount, British coal magnate and food controller: b. Aberdare, Wales, 26 March 1856; d. Llanwern Park, Wales, 3 July 1918. He was educated at Caius College, Cambridge, and was a scholar of Jesus and Caius colleges.

He entered the colliery firm in which his father held a large interest, and at the time of his death was senior member of the firm of Thomas and Davey. In 1916 he effected a great combination of the coal-mining interests known as the Cambrian mines, in which he was a controlling director. His reputation was that of a hard, resourceful fighter, whose sympathies were with the people. He served as president of the Cardiff Chamber of Commerce in 1895 and from 1893 to 1897 was president of the South Wales Liberal Federation. From 1888 to 1910 he represented Merthyr Burghs in the House of Commons, and in 1910 represented Cardiff. In 1916-17 he was president of the local government board. His most conspicuous service to his country was as food controller, to which position he was appointed in 1917. The appointment became effective in June of that year. At once, under the power given him by the Defense of the Realm Act, he took over the wheat, potato, barley, oats and rye crops. He announced that the solution of Great Britain's food supply was in America, and he set out to obtain the co-operation of the United States. In the winter of 1917, when the expected American supplies of wheat and meat did not arrive, it was Lord Rhondda's careful handling of the food distribution that saved England from extreme hardship. He put an effectual stop to profiteering and speculation in food. In January 1918 the rationing system was put into effect. Customers were required in every community to register, to buy only at one store and to buy at no store where they could not be accommodated quickly. Drastic restrictions were put on the use of wheat and grains. Lord Rhondda's greatest source of satisfaction in his work was the fact that the German government had directed its newspapers to be silent about the food supply in England. His resignation from the post of food controller was first made in February 1918 when his health failed. He continued *in absentia* at the Premier's request and was officially in office when he died. In 1916 he was created first baron of Llanwern and on 3 June 1918 was made viscount in recognition of his delivery of England from a food crisis.

RHONDDA, a river and town of South Wales, in Glamorganshire. Its valley is the seat of a large population engaged in coal-mining and metallurgical industries. The inhabitants are employed mainly in collieries, iron-works, etc.

RHONE, *rön*, a river of Europe which rises in Switzerland, near the east frontiers of the canton of Valais. Its precise origin is commonly said to be in the Rhone glacier, between Mount Furca on the east, the Gallenstock on the north and the Grimsel on the west, 5,581 feet above the level of the sea; but the natives give the name of Rhodan or Rotten to three springs situated in a single basin at the foot of the Mayenwand, at an elevation of 5,282 feet, the water of which flows with an equal temperature in summer and winter (61° to 63° F.), and these they consider to form the true source of the Rhone. The waters from these springs join the stream from the glacier at a very short distance from their origin. The young river dashes down with great rapidity into the valley beneath, leaping from cascade to cascade; tra-

verses the centre of Valais in a westerly direction, and near Villeneuve enters the Lake of Geneva at its eastern extremity. On entering the lake its waters are surcharged with mud; but on issuing from it, at its southwest extremity, at the town of Geneva, it is of a pure deep blue color, soon after changed into a muddy brown by the accession of the glacier-born Arve, which joins it one and one-half miles below Geneva. Proceeding southwest to the frontiers of the department of Ain in France, it turns almost due south, forming the boundary between that department and Savoy; then turning suddenly northwest, traces the boundary between the same department and that of Isère and reaches Lyons. Here, having at least doubled its volume by the accession of the Saone, it proceeds almost due south, separating the departments of Rhone, Loire, Ardèche and Gard on the west, from the department of Isère, Drôme and Vaucluse on the east. On approaching Avignon it takes a more circuitous but still southerly course, separates the department of Gard from that of Bouches-du-Rhône, traverses part of latter department and finally falls into the Gulf of Lyons in the Mediterranean. At Arles it divides into two branches, the lesser of which, under the name of old Rhone, flows southwest, forming the west side of the large delta, known by the name of the Ile de Camargue. The main branch, under the name of Grand Rhone, continues its southerly course, but again divides into two branches and enters the sea by two mouths. Its whole course is about 580 miles, of which 200 miles are in Switzerland and 380 miles in France. It is navigable for 360 miles. By means of a series of magnificent canals, the navigation of the Rhone has been continued, without interruption, to the Rhine (through the Saone), Seine, Loire and Garonne.

RHOPALACERÆ, butterflies (q.v.); see also LEPIDOPTERA.

RHUBARB, WINE PLANT, or PIE PLANT, several species of perennial herbs of the genus *Rheum*, family *Polygonaceæ*. They are natives of Asia and eastern Europe and have generally very large radical leaves with thick fleshy petioles and small greenish or whitish flowers in racemes or paniculate fascicles which are borne on stout stalks well above the foliage. Several of the species are valued for bold effects in ornamental gardening, and some have been used in medicine, but the most important species is the common rhubarb (*R. rhabarbarum*) which has long been cultivated in gardens for its tender, acid, esculent leaf-stalks, which are largely used for making pies, sauce and preserves in spring, and to a less extent for home-made wine from the juice. The plants are usually propagated by means of divided roots, though seed is also used. They thrive best in rich, light, friable loamy soils, well drained but moist, and given liberal applications of manure of all kinds. The plants should be set not less than three feet apart each way, given clean cultivation until the foliage shades the ground and mulched with stable manure during the winter. When two years old the stalks may be used freely. They are most easily gathered by bending them down while being pulled. The earliest stalks are ob-

tained by inverting a barrel over the plants and heaping manure around it; but for forcing the roots are dug in autumn, allowed to freeze, covered with earth or sand in cellars, under greenhouse benches, etc., and watered. After producing a crop the roots are thrown away. Large quantities are cultivated in the Southern truck gardens, but the forced stalks are considered superior and generally command higher prices.

Turkey rhubarb, formerly popularly used in medicine is supposed to be derived from *R. palmatum*, but the exact species seems to be still undetermined. Chinese Tartary and parts of China were the principal shipping countries, but Asia Minor was also a producer.

RHUMB-LINE, a line described on the earth's surface by a ship sailing steadily in the direction of any one point of the compass, except one of the four cardinal points. A rhumb-line laid down on a map drawn on the principle of Mercator's projection is a straight line cutting the meridians at a constant angle; but if a rhumb-line be drawn on a globe, so that it will cut the meridians all at the same angle, it will be found to be a spiral curve such that however far it may be produced it will always approach the pole, but never reach it.

RHUS, a genus of the cashew-nut family (*Anacardiaceæ*). It is found all around the world, and the species are generally shrubs, with simple or compound leaves, and small five-merous flowers in panicles. The fruit is a dry, one-seeded drupe, often in conspicuous masses. Some, like the American staghorn sumac (*Rhus typhina*), with its tropical appearance and the smoke-tree (*R. cotinus*) are planted for ornament; and the *R. coriaria* is cultivated along the Mediterranean for its leaves, a valuable material for tanning leather, when a fine white color is desired, as in light morocco. The foliage of some other species is also gathered for the same purpose. The American aborigines used *Rhus* berries for red and the juice for black dyes and the bark of *R. glabra* is employed as a mordant for red colors. Oriental lacquer is made from juice exuding from incisions in the bark of *R. vernicifera*. Many species, including the *R. toxicodendron*, which, like *R. vernis*, is poisonous to the touch (see PLANTS, POISONOUS), are used in medicine, and the acid fruits of certain species are made into cooling drinks or sharpened vinegar. Chinese galls are produced by *R. semialata*, and candlewax is expressed from the berries of the wax-tree (*R. succedanea*) and from *R. vernicifera*, often planted in Japan, for that purpose. One or two species furnish a useful wood.

RHYACOLITE, a variety of orthoclase, occurring in glassy crystals in the lavas of Vesuvius, Italy.

RHYME, accentual verse, characterized by agreement of terminal sounds. Rhyme was used, in a sense which has now become obsolete, to mark similarity of syllabification in other portions of the line than at the end. Thus the old writers speak of rhyming words when they mean words beginning with the same consonant, that is, in alliteration; also, in Spanish and Portuguese what we now call assonance—a coincidence of vowels in corresponding syllables, without regard to the consonants—was

also called rhyme. Rhymes of to-day demand agreement in final syllables of the sound of the vowels and the succeeding or interposed consonants, if there are any, with a dissimilarity of preceding consonants, if there are any. Rhymes of such a character are of three kinds in English: single, or of one syllable, as flap and slap; double, or of two syllables, as greeting and fleeting; triple, or of three syllables, as merrily and cheerily. The single rhymes are often called masculine and the double feminine rhymes. The triple rhyme is used, in English, principally in verse of a conversational or comic or facetious nature. Rhymes of more than three syllables are practically unknown in all except the Persian language and its branches. In the perfect rhymes of to-day the preceding consonants, it has been stated, must not be the same; thus, partake and lake make perfect rhymes, but not partake and take, which makes an inelegance to the ear. The final syllables, moreover, of the perfect rhymes must both be accented; thus butterfly will not rhyme with terribly, although the final syllables are suited in other respects for rhyming. There are, however, rhymes which occupy middle ground—permitted by the exigencies of the occasion in which they are used (known as poetic license)—which are not to be tolerated in ordinary occasions or if frequently used. Such rhymes are those that nearly coincide in sound and which do not offend the ear by failing entirely to do so. Thus gone may be rhymed with alone under poetic license. There is no rule by which a permissible imperfect rhyme may be determined and the only criterion is to be found in good usage as established by the better class of authors. Some languages incline more to the masculine rhyme, as the English, on account of its superabundance of monosyllables; others, as the Spanish and Italian, more to the feminine; the German and French possess an almost equal store of both. The feminine rhymes in French all contain an *e* mute in the last syllable; and from the beginning of the 16th century it has been the almost uniform practice among French poets in dramatic, heroic, elegiac, satirical and other forms of poetry to make couplets of masculine rhymes alternately with others of feminine rhymes. In the ode combinations of rhymes are used, but always regular. When two successive lines rhyme they form a rhymed couplet, the measure used by Pope in his famous 'Essay on Man.' Three successive rhyming lines form a triplet; four a quatrain, but there may be two pairs of rhymes in a quatrain. Rhymes are used throughout poetry in accordance with the author's own taste and inclinations. In some poetry every line is rhymed with some other. And this may be an adjacent line or one separated from its partner by one or more lines which do not end with the same rhyme, but with some other. The position of the rhyming pairs in the stanzas must be the same in each verse of the composition, and, moreover, within the stanzas the rhymes must occur regularly, according to some fixed scheme. In long poems, indeed, it is not infrequently the case that different portions of the poem employ stanzas in which the rhyme schemes differ. This is permissible because, on account of the length of the composition, the effect is the same as if it were composed of several shorter poems.

It is not necessary that every line in the

poem should rhyme, and some of the pleasantest effects have been produced by the use of a mixture of rhyming and not-rhyming lines. When rhyme is totally absent poetry is spoken of as blank verse. The rhyme does not always occur only at the end of lines. It sometimes occurs at two places within the line, at the middle and at the end. But this is only a supplementary or secondary rhyme; it is not to be used except in conjunction with lines which have proper or terminal rhymes.

The rhyme scheme employed, in conjunction with the kind of measure used, determines the structural character of poetry (q.v.). The most complex forms now used in English are found in the sonnet (see POETRY) and in the Spenserian stanza, so-called because adopted by Spenser and used in his 'Faerie Queene.' There are a number of artificial forms of verse known as the French forms, because invented and brought to perfection by the poets of that nation, in which the positions of the rhymed lines vary greatly not only in the stanzas, but in the poem as a whole. The most commonly employed of these forms are the triolet, rondel, rondeau, villanelle and ballade.

The modern use of rhyme was not known to the ancient Greeks and Romans. We meet, indeed, with some rhymed verses in Ovid, in which the rhyme was evidently intentional; but these examples are rare. It has been used, on the other hand, from time immemorial among the Chinese, Hindus, Arabs and other Oriental nations. Rhyme began to be developed among Western nations in the Latin poetry of the Christian Church. It is found used as early as the 4th century, and in subsequent centuries grew to common use in the writings of Church officers and ecclesiastical students. The use of rhyme in the vulgar dialects of Latin was even more general than in ecclesiastical poems, as is shown by the poetic monuments of the Romance nations belonging to the 9th and 10th centuries. In the Latin poems of the Fathers of the Church of the 4th century rhymes are more frequently used. The most ancient relics of Teutonic and Scandinavian poetry are not in rhyme, but are distinguished by alliteration. The earliest use of rhyme in a Teutonic dialect is in Otfried's 'Evangelii,' written in Frankish, in the latter part of the 9th century. The oldest forms of rhymed verse are the couplet and the continuation of one and the same rhyme through a whole piece. The oldest poems of the Chinese, Indians, Arabians and of other ancient peoples are rhymed; so are those of the Irish and the Welsh. In the fragments of the earliest Latin poetry yet found, where the metre is accentual, not quantitative, there is a marked tendency toward rhymed endings. This tendency was lost for a time under the influence of Greek poetry in which the measures are quantitative. Still the partiality for rhymes was not lost, as is proven by the verses of Ovid, and upon the decline of classicism, they became common. An attempt at sustained rhymed verses can be found as far back as the 4th century, as evidenced in the verses of Hilary. By the end of the Middle Ages rhymed Latin verse had reached its perfection. For a general discussion of rhyme schemes and verse-forms consult Raymond, G. L., 'Rhythm and Harmony in Poetry and Music' (1895); Guest, 'History of English Rhythms' (1838); Parson, 'English

Versification'; Trench, R. C., 'Sacred Latin Poetry.'

RHYMER, Thomas, the familiar name of an early Scottish poet, whose real name is supposed to have been Thomas Learmount. He flourished in the latter part of the 13th century at Ercildoune (modern Earlston), Berwick. To this day the name of Thomas the Rhymer is popularly known in Scotland as that of a prophet, who derived his powers from residence in Fairyland; and it is only through the discovery of the manuscript of a metrical romance called 'Sir Tristram' (supposed by Scott to be his work, though this is still a matter of dispute) that he has acquired a better claim to remembrance. A good edition of the 'Tristram' is that of M'Neill (Scottish Text Society, 1886). Consult also Murray's edition of the 'Romance and Prophecies of Thomas of Ercildoune' (Early English Text Society, 1875); Scott's 'Minstrelsy of the Scottish Border' (1806); and Child's 'Popular Ballads' (Part II, 1884).

RHYNCHOCEPHALA, rin-kō-sēf'a-lā, an order of very ancient prosaurian reptiles, fossil chiefly in the Old World Triassic, having much superficial resemblance to lizards. They are characterized by a fixed quadrate bone, an inferior temporal arcade, a closed palate and separate premaxillæ. They were unarmored, terrestrial, lizard-like creatures, varying in length from a few inches to six or eight feet. Important genera are *Rhynchosaurus*, *Hyperodapedon*, *Homæosaurus*, found in Europe and India. The most remarkable genus, however, is *Sphenodon* (or *Hatteria*), one species of which is still living in New Zealand. See **TUATERA**.

RHYOLITE, a silicious porphyritic rock resembling granite in chemical composition. The name was first given by Richthofen to igneous rocks in Hungary distinguished from trachyte mainly by a more varied texture and the presence of quartz. The western Cordilleras of America, as well as like regions elsewhere, contain rhyolite in vast areas. Rocks of the same or similar structural character are now known also under the names of liparite and nevadite. The rocks which petrographers formerly classed among felsites are now mainly described under the name of rhyolite, which includes a much greater number of varieties.

RHYTHM, rithm, (a) in *metrics*, the measure of time or movement by means of a numerical proportion or harmony. (b) In *prose literature*, it follows no regular law, but consists in an arrangement of words in an expressive succession. This arrangement may at times approach the regularity observed in rhythm in verse; and the term prose-poetry has been applied to the prose in which such regularity is strongly marked. In poetry, rhythm is reduced to law and consists in a regular succession of arses and theses (long and short; accented and unaccented syllables). This results in a precise cadence or variety of cadences; modified, of course, by the pauses necessary to rhetoric. (See **PHRASE**; **RHYME**). (c) In *music*, the swing and sweep of a composition, emphasized by the accents ringing out in their proper places and attaining a series of climaxes in the special stress given to each metrical di-

vision of the work, accent being the life of rhythm. (See **MUSIC**; **MUSICAL ELEMENTS AND TERMS**). (d) In *psychology*, the movement or intervals expressive of emotion and feeling set up by changes of relative duration and of quality between recurrent brain-stimuli. (e) In *physiology*, the proportion as to time between the action of an organ, of an intermittent or remittent disease, etc., at successive periods, as in respiratory rhythm establishing first the number of inspirations per minute in normal breathing, then showing the greater or less frequency in certain states of health.

RHYS, rēs, Ernest, Welsh author and critic: b. London, 17 July 1859. He was educated at Bishops Stortford and Newcastle-on-Tyne and in 1877 became a mining engineer. In 1885, however, he turned his entire attention to literature and in 1887 made a lecturing tour in the United States. He was editor of the Camelot series of reprints and translations (65 vols., 1886-91), of 'The Lyric Poets' (12 vols., 1894-99) and other publications and has written 'The Great Cockney Tragedy' (1891); 'Welsh Ballads and other Poems' (1898); 'Frederick Lord Leighton' (1898); 'The Whistling Maid' (1900); 'Celtic Lore' (1901); 'Ogam-inscribed Stones Preserved in Dublin' (1902); introductions to several volumes of 'Everyman's Library,' of which he is general editor. Other works are 'The Fiddler of Carne' (1896); 'The South Wales Coast' (1911); 'Lyric Poetry' (1913); 'Romance' (1913); 'Rabindranath Tagore' (1915).

RHYS, Sir John, Welsh Celtic scholar: b. Ponterwyd, Cardiganshire, 21 June 1840; d. 1915. He was educated at Bangor Normal College for the teaching profession; kept a school in Anglesey till 1865 and in 1869 was graduated from Oxford. Continuing his studies at the Sorbonne and Collège de France in Paris, Heidelberg, Leipzig and Göttingen, in 1871 he was appointed inspector of schools for Flint and Denbigh, and in 1877 professor of Celtic in Oxford University, becoming in the same year an honorary Fellow of Jesus College, of which he served as principal after 1895. He was already known as a Celtic scholar before the publication, in 1877, of his 'Lectures on Welsh Philology' gave him a high reputation in this department of scholarship. Later works are 'Celtic Britain' (1882); 'Origin and Growth of Religion as Illustrated by Celtic Heathendom' (1887); 'Studies in the Arthurian Legend' (1891); 'The Early Ethnology of the British Isles' (1891); 'Inscriptions and Languages of the Northern Picts' (1892); 'Celts and Pre-Celts; The Welsh People' (1900) in collaboration with J. B. Jones; and 'Celtic Folk-lore' (1901). He also edited various Welsh texts in conjunction with J. G. Evans.

RHYTINA. See **SEA-COW**.

RIALL, ri'al, Sir Phineas, British military officer: b. County Tipperary, Ireland, 15 Dec 1775; d. Paris, France, 10 Nov. 1850. He entered the British army as ensign in 1794 and became major in the same year. In 1804 he was attached to the 15th Foot and in 1808-10 commanded a brigade in the West Indies. He was promoted major-general in 1813 and ordered to Canada to participate in the wa-

against the United States. He served on the Niagara frontier and was chief in command in the campaign against Gen. Jacob Broun in the following summer. He was defeated at Chippewa and at Lundy's Lane, being severely wounded and taken prisoner in the latter engagement. He was appointed governor of Grenada in 1816, was knighted in 1833 and in 1841 received full rank as general. Consult Morgan, 'Sketches of Celebrated Canadians and Persons Connected with Canadian History' (1862).

RIALTO, *rê-âl'tô*, (1) the principal bridge of Venice (q.v.), the only one spanning the Grand Canal. It consists of a single arch 90 feet in span and 24 feet high, and was built of marble at a cost of over \$500,000, in 1590. Two ranges of shops divide the bridge road into three narrow parallel streets. Shakespeare mentions the bridge and contiguous promenades as a rendezvous in 'The Merchant of Venice,' and the term has become synonymous with the meeting places of the theatrical profession in most populous centres. (2) The Rialto in New York was first applied to the section on 14th street, between Broadway and Fourth avenue; but has now extended to the west portion of Broadway, between 25d and 32d streets.

RIAZAN, or **RYAZAN**, Russia, (1) city, capital of the government of Riazan, on the Trubesh, a branch of the Oka. It is in an agricultural region, in which the chief product exported is rye. The chief manufactures of the city are woolen and linen goods, leather and needles. Nearby is the village of Grishina, in which are large cutlery works. Pop. about 48,000. (2) The government of Riazan has an area of 16,254 square miles. It is drained by the Oka and its tributaries. The chief manufactures are cotton, linen and woolen goods and leather. Rye is the principal grain exported. Pop. about 1,900,000.

RIB. The ribs are a series of flattened, narrow bones which together with the sternum in front and the vertebral column behind form the bony cage which encloses the thoracic organs and supports the muscular structures surrounding the chest cavity. In man there are 12 pairs of ribs, of which the first seven articulate directly with the sternum by means of their costal cartilages and are called the *true* ribs. The cartilages of the eighth, ninth and 10th ribs join the cartilage of the seventh rib and are, therefore, termed *false* ribs, while the 11th and 12th ribs are free at their anterior extremities and are spoken of as the *floating* ribs. The seventh rib is the longest of the series, the others decreasing progressively in size to the first and to the 12th. The seventh is considered the most representative rib, and is described as having an anterior or sternal extremity, a shaft and a posterior or vertebral extremity. The sternal end is hollowed slightly to receive the cartilaginous prolongation by which it is connected with the sternum. The shaft is flattened and has an external and an internal surface. Its lower edge is slightly grooved to shelter the intercostal vessels and nerve which run parallel to and close to it. The head presents two facets which articulate with the bodies of two adjoining dorsal vertebrae, and the neck is the short portion between the head and the beginning of the shaft. At the junc-

tion of the neck with the shaft there is a small swelling called the tubercle which has an articular facet for contact with the transverse process of the lower of the two vertebrae with which the head articulates, and a roughened area for the attachment of a ligament. The rib presents two curvatures, one around a vertical axis and the other about a horizontal axis, the effect of which is that the bone cannot be laid on a plane surface in such a way that both ends and the shaft between shall be in contact with it. The point at which the curvature is most acute is called the angle of the rib. Most of the ribs are so placed in the body that their sternal extremities are much lower than their points of attachment to the vertebral column, and through this arrangement as well as their peculiar curvature, when they are raised in inspiration the capacity of the thorax is increased both in its anteroposterior and lateral diameters. In some diseases, notably rickets (q.v.) and emphysema (q.v.), which are characterized by changes in the shape of the chest, the ribs undergo alteration in curvature. In children having rickets the anterior portion of the ribs sinks in so that the sternum becomes more prominent and the ends of the ribs may be enlarged and beaded, forming what is called the "rachitic rosary." If, in addition to rachitis there is present some respiratory obstruction from such causes as adenoids, nasal catarrh, etc., the "pigeon" or "keel" breast may result. In this the lateral compression is carried to a more extreme degree and the cross-section of the chest approaches the triangular shape with the apex forward. A funnel-shaped depression over the lower point of the sternum is sometimes caused by rickets, but may be congenital or due to the habitual pressure of a work bench or tools, as in cobblers, for example. In the emphysematous chest the ribs are thick and run more nearly horizontal so that an increase in the anteroposterior direction and outward bulging of the middle portion are caused, giving rise to the so-called barrel-shaped chest. The flat chest is the opposite of this, as its name implies, and has a short anteroposterior diameter. It is often associated with a tendency to pulmonary tuberculosis. Very rarely the ribs are more or less numerous than normal, but a not unusual deformity is the non-attachment of the anterior end of the 10th rib, so that it, too, is a floating rib. This abnormality is by some authorities considered as an indication of a tendency to neurasthenia. Fractures of the ribs are not infrequent injuries. Owing to the more sheltered position of the upper and the greater mobility of the lower members of the series it is most often the fourth to the eighth ribs that are fractured. Unless there is some complication, such as internal injury, the outlook is usually good. The treatment consists chiefly in immobilizing the side of the chest affected by adhesive plaster strapping. In treating collections of purulent fluid in the pleural cavity, it is often necessary for the surgeon to resect portions of one or more ribs in order to secure free drainage. See ANATOMY; OSTEOLOGY; THORAX.

RIBALTA, (1) **Francisco de**, Spanish painter: b. in Castellon de la Plana, Valencia, about 1550; d. Madrid, 12 Jan. 1628. Of the Spanish school of painting, he studied first in

Valencia and afterward in Italy, where he came under the influence of Raphael, Piombo and the Carracci. Returning to Spain he was received with honor and engaged to paint pictures for many churches and convents in Valencia. His work is remarkable for grandeur of conception, good taste in composition, freedom of drawing and correct anatomical design, but like other Spanish painters he was an extremist, depicting alternately agony and ecstasy. Among his best pupils were his son Juan (q.v.), Ribera known as Lo Spagnoletto, and Gregorio Castenada. Of his paintings perhaps the best are 'Dead Christ and Angels,' 'Saint Francis,' 'Blessed Soul' and 'Lost Soul,' in the Madrid Museum; 'Saint Francis Embracing Christ,' 'Saint Peter,' 'Conception' and 'Saint John Baptist,' in the Valencia Museum; 'Virgin and Saint John Returning from the Sepulchre,' at Munich; and 'Saint Joachim and Saint Anne,' 'Christ on the Cross' and 'Magdalen at Sepulchre,' at Saint Petersburg. He also painted portraits of many prominent Valencians. (2) JUAN DE, his son, flourished about 1597-1628. He painted so nearly in his father's style that their works are often confounded. When 18 he painted the admirable 'Crucifixion' in the Valencia Museum. Among his works are 'Saints John and Matthew,' 'Saints Mark and Luke' and 'A Singer' in the Madrid Museum; 'Pope Gregory the Great Celebrating Mass,' in the Dresden Museum; 'Jephtha's Sacrifice' and the 'Martyrdom of Saint Catherine.'

RIBAUT, rê-bô, or **RIBAUT**, Jean, French soldier and colonist in the New World: b. Dieppe, about 1520; d. Florida, 1565. A Huguenot, he was sent by Admiral Coligny to establish a colony of French Protestants in North America. He went out in 1565 with an advance party, with which he built a fortress at Port Royal in the present South Carolina. A garrison of 30, left by him in charge, finally mutinied and, having slain their leader, set out in a crazy vessel for France. Half famished, they were carried by an English cruiser to London. Ribault was made governor of a proposed colony in Florida in 1564 and sent out René de Laudonnière, who built Fort Caroline near the mouth of the Saint John's. In May 1565 Ribault himself with seven vessels and a force of 300 set sail for the colony, where he arrived 28 August. A Spanish expedition under Pedro Menendez de Avilès had, shortly after Ribault's arrival, begun work on intrenchments on the site of Saint Augustine, and Ribault determined on an attack before the fortifications had been completed. His ships, however, were wrecked in a hurricane, and Menendez, marching overland, captured Fort Caroline and butchered almost all whom he found there. Ribault, with most of his force, was saved, endeavored to return but was intercepted by Menendez, and with a portion of his followers were murdered. This ended the Huguenot colony in Florida. Consult Gaffard, 'La Floride française' (1875); Parkman, 'Pioneers of France in the New World' (1885).

RIBBECK, Johann Karl Otto, German philologist: b. at Erfurt, 23 July 1827; d. 1898. In early life he went to Berlin, where he studied under Lachmann, Bopp and Böckh, and from there to Bonn where he was a close student of the methods of Welcker and Ritschl. Having

received his degree in Berlin and traveled for a year through Italy, in 1853, he returned to Berlin, where he entered Böckh's school. He then became a teacher, being called successively to Elberfeld, Bern, Kiel, Heidelberg, and finally, in 1877, to Leipzig, there becoming the successor of his former master, Ritschl. Ribbeck's works are mostly confined to criticisms of Latin poetry and to classical character sketches and display a profound knowledge of the classics combined with a brilliant style of essay. Among them are 'Vergellii Opera,' with prolegomena and critical notes (5 vols., 1859-69); 'Tragicorum Latinorum reliquiae' (1862); 'Cornicorum Latinorum reliquiae' (1855); 'Der echte und unechte Juvenal' (1865); 'Horace's Epistles' (1869); 'Zur Lehre von den Latein Parüketen' (1860); 'Die römische Tragödie im Zeitalter der Republik' (1875); Plautus's 'Miles Gloriosus' (1881); the biography of Friedrich Ritschl (2 vols., 1879-81); 'Geschichte der römischen Dichtung' (3 vols., 1889-92; 2d ed., 1897-1900); and the classical character sketches (which appeared in the *Rheinische Museum*, of which he became editor in 1876) 'Alazon' (1882), 'Kolax' (1885) and 'Agroekkos' (1885).

RIBBED VAULTING. See **GOTHIC ARCHITECTURE**; **VAULT**.

RIBBON, a narrow web, generally of silk, used for tying and ornamental purposes. Ribbon-weaving is a special branch of the textile industries. In modern looms as many as 40 ribbons are simultaneously woven in one machine. Mixed fabrics of silk and cotton are now largely employed. See **SILK AND SILK INDUSTRY**.

RIBBON-FISH. See **DEEP-SEA LIFE**.

RIBBON-SNAKE, a garter snake (q.v.) of slender form and conspicuous stripes.

RIBBONISM, in Irish history, the name given a group of secret associations among the lower classes in Ireland throughout the half century extending from 1820-70, at its greatest height from about 1835 to 1855. Its origin and organization are alike wrapped in obscurity, but it appears in the beginning at least to have been political in its aims, and it seems probable that it grew out of the northern Defenders who banded themselves to oppose the Orange organization. Earlier associations with somewhat similar aims were the Whiteboys and the Threshers, and in particular corners of the island, the Carders, Shanavests and Caravats. Though everywhere condemned by the Roman Catholic clergy, Ribbonism included none but Roman Catholics within its numbers, and it maintained its influence by a system of oaths and secret signs and passwords. One striking feature of Ribbonism, as distinguished from most Irish patriotic associations, was the fact that its adherents belonged exclusively to the very lowest and most ignorant classes, the humbler peasantry, farm servants, laborers and petty shopkeepers, hardly even the smallest farmers or their sons apparently belonging to it in any part of Ireland. So far as there was any unity in its aims, it aimed at making itself a public conscience on all agrarian questions; but, the Ribbonism of one period and of one district was not the Ribbonism of another. In Ulster it professed to be a defensive or retaliatory

league against Orangism. In Munster it was at first a combination against tithe-proctors. In Connaught it was an organization against rack-renting and evictions. In Leinster it often was mere trade unionism. The name originated in a badge worn by the members.

RIBEIRO, rê-bá'roo, Bernardim, Portuguese poet: b. Torrão, Alemtejo, about 1486; d. about 1550. He appears to have been a gentleman of the chamber at the Portuguese court and to have been involved in an unhappy love affair with Donna Joana de Vilhena, a relative of the king. He was one of the first to introduce in Portuguese literature the Italian pastoral style which has since prevailed in Portugal. Of his writings there are still extant five idylls and several lyrics beside his best-known work, the pastoral romance 'Menina e Moça' (1554). Editions of the 'Obras de Bernardim Ribeiro' were published in 1645, 1785 and 1852, and in 1891 an excellent edition of 'Menina e Moça' with a 'Prefacio' was edited by Dom Jose Pessanha.

RIBEIRO-FERREIRA, fâr-râ'ê-râ, Thomas Antonio, Portuguese poet: b. Parada de Gonta, Portugal, 1 July 1831; d. 1901. He was educated for the bar at Coimbra and in 1870 was appointed Secretary-General of the Portuguese colonies. In 1878 was appointed Colonial Secretary, in 1881, Minister of the Interior, and in 1885 and 1890 was Minister of Public Works. He was Minister to Brazil in 1895-96. As a poet he attained high rank, his work exhibiting much grace and a fervid patriotism. His works include 'Sons que passam' (1854); 'Vesperas' (1858); 'Don Jaime' (1861); 'Delírio do Mal' (1868); 'Dissonancias' (1890), etc.

RIBERA, rê-bâ'râ, José or Josepe de (known as 'LO SPAGNOLETTO'), Spanish painter: b. Jativa, kingdom of Valencia, 12 Jan. 1588; d. Naples, 1656. Although early entered at the University of Valencia, he preferred the studio of Francisco de Ribalta (q.v.) to the schools of book-learning. He eventually left Valencia for Naples, and thence took up his residence at Rome, where he was given the name of Lo Spagnoletto, 'the Little Spaniard.' Here he studied the works of Raphael and the Caracci. He also visited Parma and Modena and copied the paintings of Correggio. It is, however, very evident that while he was at Naples Cavaraggio exercised a preponderating influence over his style, and though a Spaniard, he must be ranked as one of the most pronounced representatives of the Naturalistic School of Naples. Pedro de Madrazo calls him 'a most excellent painter, who finds his place among the greatest Italian masters.' Both in coloring, chiaroscuro and anatomical knowledge he excels many of the Neapolitan school; but he generally chose gloomy, austere or revolting subjects for his powerful brush, and these he treated with a wild and extravagant fancy which deepened the horror each incident inspired, such are his 'Prometheus Chained to the Rock'; 'The Torment of Sisyphus'; 'The Flaying of Saint Bartholomew'; 'Saint Sebastian Transfixed with Arrows' (all in the Prado Museum, Madrid); 'The Martyrdom of Saint Lawrence' (Dresden Gallery). His etchings, of which he left 26, are mostly figure pictures of great spirit and power. He had a great number of

pupils and imitators, among whom were Salvator Rosa and Lucio Giordano. Consult 'Diccionario historico de las bellas artes' (1800) and 'Diccionario Enciclopedico Hispano-Americano' (1895).

RIBOT, rê'bô', Alexandre Félix Joseph, French statesman: b. 1842. Shortly after his admission to the Paris bar, he was appointed deputy procurator-general before the Tribunal in 1870, and became secretary-general of the Ministry of Justice in 1878. In that year he was also elected deputy for Saint-Omer, and later senator. He was Foreign Minister in the Freycinet Cabinet formed in 1890, and during his tenure of that office the alliance with Russia was concluded. In 1893 he became Premier during the Panama upheaval, and again after the resignation of Casimir-Périer in 1895. In December 1912 he accepted candidature for the French Presidency, but on 17 Jan. 1913 M. Raymond Poincaré (q.v.) was elected, with M. Briand as Premier. The latter fell on 18 March and was succeeded by M. Barthou, who in his turn was defeated in December. M. Ribot, then Finance Minister, was invited to form a cabinet, but he was unable to gain the necessary support of the Republican party to his policy of conciliation. M. Dupuy met with a similar failure. The next attempt, that of M. Doumergue, succeeded, and Caillaux became Finance Minister. On 26 March 1914 the wife of Caillaux shot Gaston Calmette, editor of the *Figaro*, at his desk, and Caillaux was driven from office. M. Ribot succeeded him at the Ministry of Finance and held that post till March 1917 when he became Premier. In September a change of government brought M. Painlevé to the helm and M. Ribot took the Foreign Office. Four weeks later he resigned, and on 23 Oct 1917 withdrew from public life. Madame Ribot was Miss Mary Burch of Chicago.

RIBOT, Augustin Théodule, French painter: b. Breteuil (Eure), 8 Aug. 1823; d. Colombes, 11 Sept. 1891. His only schooling in art was obtained by copying pictures in the Louvre. His early works were household and kitchen scenes; 'Cooks'; 'The Dinner Hour'; 'Interior of the Kitchen'; 'The Merry Cook' and 'Poultry.' After 1865 he painted religious subjects; but chose to interpret them by selecting scenes of modern life which he gave with a startling realism. 'Jesus in the Temple'; 'Saint Sebastian' and 'The Good Samaritan,' now in the Luxembourg Gallery, are examples in this vein. In his early days he was forced to practise his art during the night hours, and this no doubt confirmed his predilection for concentrated light and strong shadows. In this he is allied to masters of the Dutch school, while in the frank realism of his methods he is classed with Velasquez and Ribera. In later life he painted historical and genre subjects in addition to his earlier field of subjects.

RIBOT, Theodule A., French psychologist: b. Guingamp, 18 Dec. 1839; d. 9 Dec. 1916. He received his education at the École Normale, Paris, taking his doctor's degree in 1875. For several years he taught at various high schools in France, and then becoming interested in experimental psychology spent several years at Paris developing this science by practical studies. He was the founder of *Revue Philo-*

sophique, and its first editor. In 1885 he was in charge of the course of psychological experimentation at the Sorbonne and in 1888 occupied the same position at the Collège de France. His published works, many of which have been translated into English, include 'La psychologie anglaise contemporaine' (1870); 'L'Herédité psychologique' (1873); 'Philosophie de Schopenhauer' (1875); 'Psychologie allemande contemporaine' (1879); 'Les maladies de la mémoire' (1881); 'Les maladies de la volonté' (1883); 'Les maladies de la personnalité' (1885); 'La psychologie de l'attention' (1889); 'Psychologie des sentiments' (1896); 'L'Évolution des idées générales' (1897); 'Essai sur l'imagination créatrice' (1900); 'Essai sur les passions' (1906); 'Problèmes de psychologie affective' (1910); 'La vie inconsciente et les mouvements' (1913).

RICARDO, ri-kār'dō, **David**, English political economist: b. London, 19 April 1772; d. Gatcombe Park, Gloucestershire, 11 Sept. 1823. His father was a prosperous Jew, born in Holland, but settled in England in his youth; and was a member of the Stock Exchange. The son was educated in England and later in Holland, but had no university training and entered his father's business at 14. He married early and conformed to the Christian religion, whereupon an alienation with his father necessitated his taking up business on his own account. In this he was immediately successful and made a fortune on the Stock Exchange, at the same time preserving an honorable reputation. In 1799 he became interested in Adam Smith's 'Wealth of Nations' and turned his attention to the scientific treatment of questions connected with banking and finance. His first contributions to the subject appeared as letters in the *Morning Chronicle* in 1809 and later appeared in a pamphlet entitled 'The High Price of Bullion a Proof of the Depreciation of Bank-notes.' The report of the bullion committee in 1810 coincided with the principles of Ricardo in its attributing the depreciation of the currency to excessive issues of the Bank of England and in recommending a resumption of cash payments. In 1816 Ricardo proposed a scheme for making bank-notes exchangeable for standard bars of gold bullion instead of coined gold. The scheme was adopted in 1819, but had to be abandoned on account of the temptation to forgery. In 1817 appeared his principal work, 'On the Principles of Political Economy and Taxation.' This work instead of being a historical or philosophical treatment of the general theme is rather a specialized examination of such factors as value, rent, wages, etc., and his contributions to these subjects, while not absolutely original, yet were for the first time stated with fullness and authority. His writings have had a profound influence upon modern doctrines, though his views are not now fully accepted. James Mill and J. R. McCulloch were his disciples. He retired from business in 1814 and in 1819 entered Parliament for the Irish borough of Portarlington. He held the seat until his death and contributed to important discussions of financial questions. Consult 'Life' by McCulloch (1846). See **POLITICAL ECONOMY**.

RICASOLI, rē-kā'sō-lē, **Baron Bettino**, Italian statesman: b. Florence, 9 March 1809; d. near Siena, 23 Oct. 1880. He first entered public

life in 1847 when he submitted to the Grand Duke Leopold of Tuscany plans of governmental reform which the latter saw himself forced to adopt. Ricasoli became mayor of Florence in 1847 and in the following year was elected to the Tuscan Parliament, and helped to bring about the recall of the grand duke. After the battle of Novara (1849) and the restoration of Austrian influence he retired to private life and devoted himself mainly to the scientific study and practice of agriculture. When the revolutionary movement of 1859 compelled the grand duke to flee, Ricasoli became Minister of the Interior, and in August of the same year dictator. He resolutely opposed all attempts at a restoration of the grand-ducal government and labored for the annexation of Tuscany to Sardinia, which was accomplished in March 1860. He was made, thereupon, governor of Tuscany, and was a member of the first Italian Parliament which assembled in 1861. In June he succeeded Cavour as head of the ministry and sought to carry out his predecessor's policy, but he could make no head against the opposition, and in March 1862 made way for the ministry of Rattazzi (q.v.). He assumed office once more in the early part of 1866, conducted public affairs with ability during the war against Austria, but met with no success in his internal policy of decentralization and financial reform because of his inability to rally a Parliamentary majority to his support. He resigned in April 1867, to be followed by Rattazzi, but remained a member of the Chamber of Deputies till his death, though taking no very active part in affairs. His 'Letters and Papers' were published by Tabarrini and Gotti at Florence in 10 volumes (1886-94).

RICCIARDELLI, rēt-chār-dē'l'lē, **Daniele**. See **VOLTERRA**, **DANIELE DA**.

RICCIO, or **RIZZO**, **Antonio**, Italian sculptor and architect: b. Verona, about the middle of the 15th century; d. about 1500. It appears that he was in early life under the Mantegazzas at Certosa, but about 1465 he removed to Venice. During the war with the Turks he was chief engineer of the Venetian republic, and at its close became the chief architect of Venice, in which capacity he rebuilt a portion of the Palace of the Doges. We lack accurate knowledge of the extent and quality of his work. It is certain, however, that he was one of the early apostles of the Renaissance. Two figures in the nude, 'Adam' and 'Eve,' are in the court of the Palace of the Doges, and are executed in the realistic manner of the Florentine school of that day. The tombs of Doge Francesco Foscari and of Niccolò Tron, both in the Frari, Venice, are ascribed to Riccio, but their style differs much from that employed in the nude figures, being more after the Paduan school.

RICCIO, or **RIZZIO**, **David**, Italian secretary to Mary Queen of Scots: b. Pancalieri about 1533; d. Edinburgh, Scotland, 9 March 1566. He was educated as musician, and in 1561 went to Scotland in the train of the Marquis of Moretto, Ambassador of the Duke of Savoy. At first a singer in Queen Mary's private chapel, in 1564 succeeded Raulet as the queen's secretary. The causes of his elevation have been variously explained. Coincident with the event was Mary's dete-

mination to act in matters of state independently of the Scottish nobles or even of her uncle of Lorraine, and the supposition is natural that in Riccio Mary found a safer confidant than in her former French secretary. After the queen's marriage to Darnley in July 1565, Riccio rose even higher in the favor of Mary, and it was Mary's avowed intention to make him her Prime Minister. His intimacy with the queen aroused the jealousy of Darnley and his haughty behavior made enemies of the nobles. The conspiracy formed to remove the objectionable secretary was precipitated into action by Mary's refusal to pardon Moray and other exiles in England. Its leaders were the relatives of Darnley, Lord Maitland who had fallen from power, and leading Protestants, including probably John Knox; with the English government standing as a neutral abettor. Riccio was dragged from the queen's supper-chamber in Holyrood Palace and despatched with at least 56 wounds.

RICE, Alice Hegan, American humorous writer: b. Shelbyville, Ky., 11 Jan. 1870. She was educated at Hampton College, Louisville, Ky., and was married to C. Y. Rice of Louisville, in 1902. Her first book, 'Mrs. Wiggs of the Cabbage Patch' (1901), attained extraordinary popularity, and was followed by 'Lovey Mary' (1903); 'Sandy' (1904).

RICE, Allen Thorndike, American editor: b. Boston, Mass., 18 June 1853; d. New York, 16 May 1889. He was graduated at Oxford in 1875 and in 1876 purchased the *North American Review*, of which he became editor. He was one of the promoters of the Charnay expedition which in 1879 investigated the ruins of primitive civilization in Central America and Mexico. He was actively interested in politics, an earnest advocate of a more efficient copyright law and was chiefly instrumental in securing the introduction of the Australian ballot system into the United States. In 1889 he was appointed Minister to Russia, but died before the date set for sailing. He edited 'Reminiscences of Abraham Lincoln' (1886), and contributed to 'Ancient Cities of the New World' (1887).

RICE, Cale Young, American poet and playwright: b. Dixon, Ky., 7 Dec. 1872. He was graduated at Cumberland University in 1893 and at Harvard in 1895. After holding the chair of English literature at Cumberland University in 1896-97 he resigned to devote his time to literature and travel. He was married to Alice Caldwell Hegan (Rice) (q.v.) in 1902, and has traveled extensively in Europe, Asia, Asia Minor and Africa. Author of (poems) 'From Dusk to Dusk' (1898); 'Song Surf' (1900); 'Mirvana Days' (1908); 'Far Quests' (1912); 'Collected Plays and Poems' (1915); 'Earth and New Earth' (1915); (dramas) 'Charles di Tosca' (1903); 'David' (1904); 'A Night in Avignon' (1907); 'The Immortal Lure' (1911); 'Porzia' (1913), etc.

RICE, Daniel, circus clown: b. New York, 1822; d. Long Branch, N. J., 22 Feb. 1900. His real name was Daniel McLaren, but he was nicknamed as a child for the old Irish clown, Dan Rice, and on entering the show business adopted that name. He became an acrobat and began his career as a clown with the Seth B. Howe Circus in 1845, attaining an immediate

success. He was later connected with Spaulding's Circus, in which he became a partner. His familiarity with the works of Shakespeare won for him the name of "the Shakespeare Clown." After a season of misfortune, during the Civil War, he was engaged by Adam Forepaugh at a salary of \$35,000 a year, and later received \$1,000 a week with O'Brien's Circus. He retired in 1882. He was lavish with his money, gave much to charity and on one occasion gave \$32,000 to President Lincoln for the benefit of wounded soldiers and their dependents. His popularity as a clown was widespread and lasting, his appearance in the circus ring always exciting wild enthusiasm.

RICE, Edmund, American military officer: b. Cambridge, Mass., 1842; d. Wakefield, Mass., 20 July 1906. He entered the Union army in 1861, received rank as captain, was voted a medal of honor by Congress for bravery at Gettysburg and was mustered out with rank as colonel in 1865. He entered the regular army in 1866, was promoted colonel and in 1877 served for a time on the staff of General Skobelev in the Turko-Russian War. He was appointed inspector-general in 1898, and in 1902-03 was colonel of the 19th infantry. He was retired in 1903. The trowel bayonet, stacking swivel and knife-intrenching bayonet now in use in the United States army were his inventions.

RICE, Edwin Wilbur, Jr., American engineer: b. La Crosse, Wis., 6 May 1862. He was educated at the Central High School, Philadelphia, and engaged in practice as an electrical engineer in 1880. He became superintendent of the Thompson-Houston Electric Company in 1883 and was also technical director in 1884-94. He was vice-president of the General Electric Company in 1894-1913, and has since been president of that organization. He is a Chevalier of the Legion of Honor, and in 1917 was president of the American Institute of Electrical Engineering.

RICE, Isaac Leopold, American lawyer: b. Wachenheim, Bavaria, 22 Feb. 1850; d. New York, 2 Nov. 1915. Coming to Philadelphia with his parents in 1856, he was educated at the Boys' Central High School of that city, and showing a genius for music was sent to Paris to complete his musical training. In 1868 he visited England where he taught music and the languages for a year when he settled in New York, teaching music for a time and then entering Columbia Law School, from which he graduated in 1880, taking prizes in constitutional and international law. He founded the School of Political Science and was lecturer (1882-83), and subsequently instructor in the Columbia Law School (1884-86). He was a specialist in railroad law and was counsel and director in the lines now constituting the Southern Railroad and for a time foreign representative of the Philadelphia and Reading Railway. He took an active part in the application of electricity to transportation and was prominently identified with many financial interests. He founded *The Forum* in 1885; and as a leader in international chess invented the "Rice Gambit." He published 'What is Music?' (1875); produced many songs, orchestral and piano compositions and notable articles in lead-

ing reviews. Consult 'Rice Memorial Supplement' in *American Chess Bulletin*, Vol. XII, p. 269 (New York 1916).

RICE, James, English novelist: b. Northampton, 26 Sept. 1843; d. Redhill, Surrey, 26 April 1882. He studied at Queen's College, Cambridge, without taking a degree, and in 1868 became editor and proprietor of *Once a Week*. He was called to the bar in 1871 and while waiting for clients he became London correspondent for the *Toronto Globe*. His first literary success was with the novel 'Ready Money Mortiboy' (1872), written conjointly with Walter Besant. The novel was dramatized and produced at the Court Theatre in March 1874. Other novels written in partnership with Besant were 'With Harp and Crown' (1874); 'The Son of Vulcan' (1875); 'The Golden Butterfly' (1876); 'The Monks of Thelema' (1877); 'By Celia's Arbour' (1878); 'The Chaplain of the Fleet' (1879); 'The Seamy Side' (1881). Rice also wrote a 'History of the British Turf' (1879).

RICE, Luther, American Baptist clergyman: b. Northboro, Mass., 25 March 1783; d. Edgefield District, N. J., 25 Sept. 1836. He was educated at Williams College, became interested in foreign missionary work and with Adoniram Judson and several others initiated a movement which led to the establishment of the American Board of Commissioners for Foreign Missions. He was ordained in the Congregational ministry, 6 Feb. 1812, and later in the month went to India to engage in missionary work. Soon after his arrival he united with the Baptists and in 1813 he returned to America to adjust his relations with the board. He then began his labors among the Baptist churches, awakening their interest in foreign missions and raising money to support the work. He was also deeply interested in ministerial education and was instrumental in founding Columbian College, Washington, D. C. He was treasurer of the college and worked energetically in raising funds for it; and he was also engaged as a missionary agent. He was noted for his sermons and was highly influential in the Baptist denomination.

RICE, Thomas D., American comedian: b. New York, 20 May 1808; d. there, 19 Sept. 1860. He was apprenticed to a woodcarver in early youth, but ran away to become an actor. In 1832 he appeared in Pittsburgh as a negro minstrel and became widely popular. He made his London debut in 1836 and afterward enjoyed repeated successes in other British cities. He elevated negro minstrelsy to a position of respectability, was almost as famous in England as at home, and for an extended period enjoyed great prosperity. He was extravagant and eccentric, however, and his career ending through a stroke of paralysis he died in poverty. His entertainments included the farces 'Jumbo Jum' and 'The Virginia Mammy'; the burlesques 'Bone Squash Diavolo' and 'Othello'; and his songs included 'Jim Crow'; 'Lucy Long'; 'Gich a Gittin' Upstairs'; and 'Clare de Kitchen,' all of which won great popularity.

RICE, William Marsh, American capitalist and philanthropist: b. Massachusetts, 1816; d. 1900. He gained a fortune of about \$10-

000,000 in the cotton business in Texas and bequeathed it as a foundation for RICE INSTITUTE (q.v.) at Houston, Tex. He came to his death through chloroform administered by his valet, who had plotted with Albert J. Patrick (q.v.) and the case developed into a sensational murder trial.

RICE, Wild or Indian. See GRASSES IN THE UNITED STATES.

RICE-BIRD, in the United States the bobolink (q.v.), so called in the south Atlantic, where it is a serious pest in the late autumn to the rice crop; in the East Indies, a familiar and handsome finch-like weaver-bird (*Munia oryzivora*), also known as the Java sparrow and paddy bird. It possesses a large pinkish bill; the head and tail are black, the belly rosy, the cheeks of the male white and the legs flesh-colored. It is dreaded in southern Asia on account of the ravages it commits in the rice fields, but is frequently brought to Europe and America as a cage-bird.

RICE INDUSTRY, American, The. The rice industry had its inception in America about the middle of the 17th century, when Sir William Berkeley made an attempt to raise rice in Virginia in 1647. As this experiment, which was continued for several years, was an utter failure, owing probably to the high latitude in which the seed was planted, it was generally believed that such a crop could not be grown in this country. The fact that this was an error was discovered accidentally, in 1694, when a vessel bound for Liverpool from Madagascar was blown so far out of her course that, having been somewhat injured by the storm, it was decided to put into Charleston for repairs. Among those who boarded the vessel was Landgrave Thomas Smith, and, at his request, the captain gave him a small package of rough rice to be used as seed. Although little faith was expressed in the success of the experiment Smith planted it in proper soil in lower Carolina and his enterprise was rewarded by the growth of a crop that was almost sufficient to meet the needs of the entire colony.

From that day the success of the rice industry was assured. By 1707, the cultivation of rice had extended so widely that no less than 100 ships sailed from Carolina with cargoes of the grain, and, during the 10 years between 1707 and 1739, inclusive, the shipments to Great Britain and other ports amounted to more than 223,787,000 pounds. In 1754, the exports of England alone aggregated over 100,000 barrels of unhusked rice, which was equivalent to 3,000,000 pounds of the cleaned product, and the supply that was left was ample for home consumption. From that time until 1784, the yield remained practically the same, but, in that year, the system of water culture was introduced, an innovation which has since resulted in constantly increasing crops.

The following statistical table gives a clear idea of the condition of the industry from the beginning of the 19th century up to 1900, together with necessary information regarding prevailing tariffs. For the sake of brevity the figures have been grouped in periods of years, with annual averages. The table is as follows:

PRODUCTION OF RICE IN THE UNITED STATES FOR
120 YEARS, 1795 TO 1915, WITH TARIFF RATES
PREVAILING FROM 1789 TO 1857.

Five years ending 30 June	Production for five years (pounds)	Average per year	Tariff on rice	
			Year enacted	Rate ad valorem
1800	320,631,803	64,124,361	1789	5 per cent
1805	240,044,600	48,008,920	1792	7 1/2 "
1810	274,477,000	54,895,400	1794	10 "
1815	274,867,800	54,973,560	1800	12 1/2 "
1820	282,397,800	56,479,560	1804	15 "
1825	333,447,000	66,689,400	1812	30 "
1830	417,333,600	83,466,720	1818	15 "
1835	457,282,200	91,456,440	1832	Free
1840	429,585,600	85,917,120	1836	15 per cent
1845	481,669,200	96,333,840	1841	20 "
1850	543,494,400	108,698,880	1857	15 "
1855	483,279,600	96,655,920		
1860	545,592,600	109,118,520		
1865	115,738,680	23,147,736		
1870	160,837,790	32,167,558		
1875	276,704,430	55,340,886		
1880	415,332,000	83,066,400		
1885	534,720,400	106,944,080		
1890	675,950,400	135,190,080		
1895	762,698,460	152,539,692		
1900	822,596,280	164,519,256		
1905	2,232,051,133	446,410,226		
1910	2,982,233,223	596,446,645		
1915	4,000,000,000	750,000,000		

Although the superiority of American rice was a well-established fact long before the Civil War the success that planters have attained since 1865 has been indicated in a better quality of rice. In the old days, before the war, when Ward's famous "long grain Carolina" rice was the standard of perfection, Georgia and the Carolinas were the only States in which rice was grown to any great extent. In nearly all the other southern States its cultivation was merely for home consumption. Since the war, however, there has been a change in these conditions: Georgia and the Carolinas have retained their rice fields, but other southern States have evinced an increased interest in the cultivation of this product, Louisiana and Texas being particularly notable examples of the gigantic strides which this industry has taken.

The southern rice fields upon which the best commercial crops are grown are the reclaimed cypress swamps and the tide-water lands along the coast. Of course, many of the finest plantations are among the marshes higher up the rivers, or even in the interior upon level tracts that are so situated that they may be irrigated with ease. In nearly all of these plantations the system of water cultivation is followed. In the case of the tide-water lands, they lie along the rivers, above the meeting of fresh and salt water, in such a position that they may be flooded with water when the tide is high and drained at low tide. Thoroughly protected by dikes, the salt water, which is so fatal to the rice, cannot reach them from below, nor can freshets sweep them from above.

The serious check which this industry received during the Civil War was not forgotten upon the declaration of peace. Lands there were in plenty, but there was no money to operate them, and it was not until incidental protection was derived from the tariff that any vigorous attempt was made to rehabilitate the old plantations. Since that time the greatest

advancement has been made in Louisiana, and, during more recent years, in Texas.

The history of rice culture in Louisiana dates back to 1718, but, during all the years prior to the war, this industry was confined chiefly to the parish of Plaquemine. Experience had shown, however, that, in Louisiana, rice was a sure crop, upon which a fair price could be realized quickly without the outlay of a great amount of money, and so, in the uncertain days that followed 1864, it was to rice that the planters turned, with the result that a crop which had never been able to do more than supply a local demand, suddenly sprang into a position of national importance. So great and lasting was this impetus that, by 1875, the State of Louisiana was furnishing fully 30 per cent of the total yield of the United States, while in each of the five years following 1880, it averaged 40 per cent; 1885, 60 per cent; 1890, 65 per cent; and 1895, 75 per cent. As the industry grew in other States this percentage fell off, and in 1916 Louisiana produced about 50 per cent, Texas 25 per cent and Arkansas 16 per cent. The year 1916 saw the largest acreage ever planted in the United States, 866,000, and the crop was 41,325,000 bushels, or 47 bushels per acre, far the best American average recorded. The best 10-year average is 34.7 bushels per acre. Before the World War the United States exported considerable rice to British India and French Indo-China, and also imported small quantities from the Dutch East Indies, Germany, Japan, China, etc. The Philippine Islands production is nearly double that of the entire United States.

India's production of rice is about 56,000,000,000 pounds annually; China's is probably as great; Japan grows 20 bushels to an acre, and the Siam crop is seven to eight times the American. The world's production is estimated at about 150,000,000,000 pounds annually.

The American storage facilities for rice are mainly in the southern States where it is grown. The mills, elevators and warehouses there have a total storage capacity of about 40,000,000 bushels, of which one-half is in Louisiana and more than a fourth in Texas. This capacity is the equivalent of a year's crop.

RICE INSTITUTE, a coeducational institution for higher education, established in 1912 at Houston, Tex., by means of a fund of about \$10,000,000 bequeathed for the purpose by William Marsh Rice (q.v.). It was incorporated in 1891 as the William Marsh Rice Institute for the Advancement of Literature, Science and Art, and at this time Mr. Rice gave the institute \$200,000 to enable the board of trustees to work out the plan under which it should be operated, actual establishment of the organization to take place after his death. The realization of the project was delayed by the years of litigation which followed the murder of Mr. Rice, in 1900; but in 1912 the institute was opened, with Dr. Edgar Odell Lovett as president. The institute has a campus of 300 acres, situated about three miles from the heart of the city; the buildings and grounds are valued at about \$1,500,000, and the annual income is about \$500,000. The courses of instruction are those usually afforded by colleges of the first class, with additional courses in chemical, electrical and mechanical engineering and archi-

ture. The institute gives the usual degrees of a college of the first class. Tuition and matriculation are free. In 1919 the institute had 50 instructors, 651 students in attendance and 325 in the United States service. Dr. Lovett has been its president from its initial establishment.

RICE LAKE, Wis., city in Barron County, on the Red Cedar River and on the Chicago, Milwaukee and Saint Paul and Northwestern railroads, about 45 miles north by west of Eau Claire. Noted as a summer resort. It is in a lumber region and the chief industries are connected with farm and lumber products. It has public and parish schools, a public library, teachers' training school and private business schools. The city has adopted the commission form of government and has a fine sewerage system. Pop. 6,000.

RICE PAPER, also called **PITH PAPER**, and more properly, as the substance is not derived from rice. The product of a small tree, 10 to 15 feet high, known botanically as *Avatia* (*Fatsia*) *papyrifera*, which grows in many portions of Formosa. Japanese name, Tsuso; Chinese name, Tung Tsao. The pith is extracted by breaking the bark and outer woody portion and forcing out the cylindrical core. Consul Jas. W. Davidson states that the paper is produced by skillfully paring these cylinders of pith with a sharp knife as they are rolled upon the surface of a tile or other hard substance that will serve as a bed plate, the thickness of the sheet of pith paper being regulated by the angle at which the knife is held. The sheets are put under heavy pressure for a time, and are finally cut into squares of three and one-half inches and packed 90 in a package. There are three grades of the paper, which is chiefly used for the manufacture of artificial flowers and also for the painting of small fancy pictures, and to some extent for sun hats. Tamsui is the port of shipment, and as high as 28,000 pounds have been exported in a single year, worth over 15,300 yen. See also **PAPER**.

RICH, Edmund. See **EDMUND**, SAINT.

RICH HILL, Mo., city in Bates County, on the Osage River; and on the Kansas City, Fort Scot and Memphis and the Missouri Pacific railroads, about 83 miles south of Kansas City. It is in an agricultural and coal region; in the vicinity of the largest coal fields in Missouri. Its chief industries are connected with the mining and shipping of coal. It has vitrified brick and tile works, canning factories, a foundry, distillery, machine shops and zinc smelters. It has an extensive trade in coal, farm products, canned goods and brick. The principal public buildings are the churches and schools. Pop. 2,755.

RICH MOUNTAIN, Battle of. After the reverse of Colonel Porterfield at Philippi (see **PHILIPPI, ENGAGEMENT AT**) General Lee ordered Gen. H. A. Wise to the Kanawha Valley and Gen. R. S. Garnett to the Cheat Mountain region. Garnett was to relieve Porterfield, recover lost ground and secure control of the Baltimore and Ohio Railroad. With one regiment he arrived at Huttonsville on 14 June, where he found Porterfield with about 1,400 men. Leaving Porterfield at Huttonsville with three companies to guard his line of communi-

cation with Staunton, Garnett marched on the night of the 15th to Beverly, from which point a regiment, a company of cavalry and two guns were sent by the Parkersburg road to the west foot of Rich Mountain, seven miles west of Beverly; Garnett, with the other regiment, two guns and a company of cavalry pushing on to Laurel Hill, the northern extension of Rich Mountain, 17 miles northwest of Beverly. These positions were regarded as the gates to northwestern Virginia, and both were strongly fortified. By 1 July Garnett had nearly 4,000 men, including his reserve at Beverly and Huttonsville.

General McClellan arrived at Grafton 23 June and prepared to expel the Confederates from their positions and to enter the Shenandoah Valley. He had 20,000 men; 5,000 along the line of the Baltimore and Ohio Railroad; a brigade of over 3,000 and a battery, under Gen. T. A. Morris, were stationed at Philippi, and by 2 July the main column, under his own immediate command, was concentrated at Buckhannon, 24 miles west of Beverly. This column of over 10,000 men, with 12 guns, was organized into three brigades, under Gen. W. S. Rosecrans, Gen. N. Schleich and Col. R. L. McCook. On 2 July Gen. J. D. Cox was ordered to cross the Ohio with a brigade and co-operate with McClellan by moving up the Kanawha Valley against General Wise. On 6 July Morris was ordered to march his brigade from Philippi to within a mile and a half of Garnett's position at Laurel Hill, and on the 9th McClellan had the three brigades of his own column at Roaring Creek, two miles from the west foot of Rich Mountain, where Lieut.-Col. John Pegram was intrenched, with 1,300 men and four guns. Preparations were made to assault Pegram in front with Rosecrans' brigade, on the morning of the 11th, but on the evening of the 10th Rosecrans learned that Pegram's rear could be reached by a difficult route around his left and proposed to do it with his brigade. To this McClellan assented. It was arranged that Rosecrans should march at daybreak of the 11th, with about 1,900 men, gain the road in Pegram's rear, march down it and attack, and that at the sound of the engagement in the rear McClellan would attack in front. Rosecrans, after a very hard march, made the turning movement, and coming to the road about 3 p.m. unexpectedly came under fire of musketry and artillery and was checked. Pegram had been warned of danger to his rear and during the morning had sent two detachments to Hart's farm, at the summit of the mountain, with Maj. J. A. De Lagnel in command, who took with him a gun of his battery and threw up breastworks for his 310 men. Rosecrans attacked, was at first repulsed, and it was not until after a sharp engagement of nearly two hours that he succeeded in driving the Confederates from position, just as Pegram was approaching with reinforcements and another gun. A part of the reinforcements became involved in the defeat, and Rosecrans captured the two guns. Nothing had been heard from McClellan, and knowing that a considerable body of Confederates was still near him Rosecrans directed his men to lie on their arms until morning. Rosecrans lost 12 killed and 41 wounded. The Confederates had made a gal-

lant fight, with a loss of 40 to 45 killed and about 25 wounded. The noise of the engagement had been heard in McClellan's ranks and he prepared for an attack in front, but the long continuance of the artillery-fire on the mountain and some cheering in Pegram's camp impressed him that it had gone badly with Rosecrans and the attack was not made, and near night he withdrew his troops beyond Roaring Creek. At daybreak of the 12th Rosecrans found that the Confederates had disappeared, and marching down the mountain he entered Pegram's abandoned camp, taking two more guns, with some sick and wounded, and as nothing was seen of McClellan, he sent him word of what he had been doing and where he was.

The forces engaged with Rosecrans on the mountain top succeeded in passing around his right during the night to Beverly, where they were joined by the 44th Virginia and the retreat was continued through Huttonsville and across Cheat Mountain to Greenbrier River, and then to Monterey. Pegram abandoned his works, intending to follow his detachment to Beverly, but in the darkness his column was broken up, part reaching that place. Pegram led the remainder to join Garnett, marching all day of the 12th and halting at night in the valley six miles north of Beverly. There, hearing that Garnett had retreated northward, and that McClellan was at Beverly, and seeing no chance of escape, he sent to McClellan an offer of surrender. This was accepted and next morning Pegram surrendered 30 officers and nearly 500 men. Garnett, at Laurel Hill, informed of the disaster that had befallen Pegram on the 11th, abandoned his works after dark, and retreated toward Beverly. When within five miles of the place, at daybreak of the 12th, he received erroneous information that McClellan had already occupied it, whereupon he retraced his steps and retreated north toward Saint George and West Union, hoping to escape by the Northwestern Turnpike, but was overtaken by Morris at the fords of Cheat River, at noon of the 13th and killed in a rearguard fight at Corrick's Ford. His army continued the retreat through Red House, Greenland and Petersburg to Monterey. McClellan occupied Beverly on the 12th and Huttonsville on the 14th, and pushed his advance to the summit of Cheat Mountain. Leaving a force on Cheat Mountain and at Huttonsville he returned to Beverly on the 16th. A few days later McClellan was called to Washington and assigned to the command of the troops for the defense of the city. On 1 November he became commander of the army of the United States. His short and successful campaign, with that of General Cox up the Kanawha Valley, settled the fate of West Virginia, stimulated the Union men in their effort to form a new government and finally resulted in the dismemberment of Virginia and the formation of the new State of West Virginia. Consult 'Official Records' (Vol. II); The Century Company's 'Battles and Leaders of the Civil War' (Vol. I).

E. A. CARMAN.

RICHARD I, king of England: b. Oxford, 8 Sept. 1157; d. Chaluz, France, 6 April 1199. He was the 3d son of Henry II of England and Eleanor of Aquitaine, and while an infant

was betrothed to Alice, a daughter of Louis VII of France. Made duke of Aquitaine in boyhood, he took part in the rebellion of his brothers against his father, who at different times attempted to deprive Richard of his possessions, and even planned to exclude him from the succession to the Crown in favor of the younger son John. In 1189, in conjunction with Philip Augustus of France, he waged war on his father and compelled Henry II to acknowledge his right to the throne. Two days after the conclusion of peace Henry II died at Chinon (6 July 1189). In September he was crowned king at Westminster and immediately began preparations for a crusade to the Holy Land, in fulfilment of a vow made two years before. To raise money for the expedition he sold fiefs and offices, surrendered to William the Lion of Scotland the suzerainty over that country, and increased the burden of taxation. Proceeding through France he joined the army of the French king at Messina, where he became involved in a conflict with Tancred, King of Sicily, in the course of which the English king made himself master of Messina. The intrigues of Philip Augustus brought on enmity between the two sovereigns and Richard repudiating his betrothed, Alice, sister of the French king, secured the hand of Berengaria of Navarre, who joined him at Cyprus, where they were married. After he had conquered the island and seized its treasures he joined the crusading army before Acre (8 June 1190). Between the English and the French bitter feelings now prevailed and at one time hostilities were threatened. Acre, nevertheless, was taken by the crusaders, and in August Philip sailed for Europe. War with Saladin (q.v.) was renewed on account of Richard's atrocious massacre of 2,700 Mohammedan prisoners. At Arsuf, 7 September, Richard won a decisive victory and in spite of prolonged negotiations moved on Jerusalem, arriving in December 1191 within a very short distance of the city. He fell back to Ascalon, where the contest between Guy of Lusignan and Conrad of Monferrat for the kingdom of Jerusalem was productive of dissensions among the crusaders. A second advance on Jerusalem met with ill success and in August 1192 Richard concluded a three years' truce with Saladin and left the Holy Land, having made no conquest beyond that of Acre. Shipwrecked in the Adriatic, he attempted to make his way disguised through Germany, but was taken prisoner near Vienna by his enemy, the Duke of Austria, who handed him over to the emperor. Brought before the imperial diet, Richard pledged himself to a ransom of 150,000 marks and received his English kingdom as a fief from the emperor. The influence of the French king and Richard's own brother was effectual in prolonging the English king's imprisonment. Liberated in March 1194 he landed in England in the same month and was crowned a second time. John was forced to submit and Richard, collecting all the money he could for a war with Philip of France, sailed for Normandy in May. The contest which dragged on for five years presents little that is noteworthy, and in January 1199 peace was made. While besieging the castle of Chaluz, held by a vassal with whom Richard disputed the possession of a newly found treasure, the

king was wounded by an arrow and died in his tent. Richard I owes his fame to the glamor with which legend has surrounded his name as the typical warrior of the Middle Ages. As a king he did nothing for England; his great passion was war, and the only redeeming features in a character of violence and ferocity are a certain naive magnanimity and the splendid courage which gained him even in his lifetime the title of *Cœur de Lion*, "Lion-hearted." The legend which recounts how Richard immured in an Austrian prison was discovered by his favorite minstrel, Blondel, who had wandered throughout Europe singing his songs outside of castle walls, dates from the second half of the 13th century. Richard figures prominently in Scott's *Ivanhoe* (1820); and *'The Talisman'* (1825), and in Maurice Hewlett's *'Richard Yea and Nay.'* Consult Stubbs, *'Early Plantagenets'* (5th ed., 1886); Norgate, *'History of the Angevin Kings'* (1887); Archer, *'Crusade of Richard I'* (1889); Round, *'Feudal England'* (1895); Stubbs, *'Constitutional History of England,'* Vol. 1 (6th ed., 1897).

RICHARD II, king of England: b. Bordeaux, 6 Jan. 1367; d. Pontefract, Yorkshire, February 1400. He was a younger son of the Black Prince and a grandson of Edward III, and succeeded to the throne on the death of his grandfather in June 1377, at a time when England was suffering from the effects of the black death, the demoralizing results of the war with France, and the misgovernment by faction that marked the latter part of the reign of Edward III. The young king was placed under the control of a council in which his uncle, John of Gaunt, Duke of Lancaster, exercised a predominant and, on the whole, pernicious influence. Popular disaffection, fed by the ill success of the government in repelling attacks on the part of the French and the Scots, was intensified by the increasing burden of taxation. The imposition of a new capital tax in 1380 led to the outbreak of the celebrated Peasants' Revolt in 1381. (See TYLER INSURRECTION). Richard displayed great presence of mind in dealing with the insurgent forces near London, and to his bearing was largely due the speedy suppression of the revolt, which was directed largely against John of Gaunt. In 1382 he married Anne of Bohemia and about the same time sought to free himself from the control of Parliament by building up a party of his own with Robert de Vere, Earl of Oxford, and Michael de la Pole, Earl of Suffolk, as a nucleus. Richard thereby came into conflict with John of Gaunt who in 1386 departed for France. The leadership of the opposition fell to the unscrupulous Duke of Gloucester, the youngest of the king's uncles. In 1387 Parliament, controlled by Gloucester, demanded the dismissal of the chancellor de la Pole, and of Oxford, who had been made Marquis of Dublin with sovereign rights in Ireland, and though the king refused to yield, he was compelled to accept a committee of 11 appointed by Parliament with extensive power of government for a period of one year. Suffolk was dismissed. When Richard set himself to overthrow the committee, the Duke of Gloucester and the earls of Arundel, Derby, Nottingham and Warwick took up arms, marched on London, demanded

the trial of five of the king's principal advisers on the charge of treason and brought about their condemnation by Parliament. Forced to submit for a time, Richard succeeded in throwing off his uncles authority in 1389 and for the ensuing eight years ruled with moderation and in peace. He had not abandoned, however, his views on the absolute authority of kings and had not forgiven the party of Gloucester for their persecution of his former supporters. In 1387 Gloucester, Arundel and Warwick were seized, and a packed and intimidated Parliament condemned the three to death. Arundel was executed, and Warwick imprisoned. Before sentence could be carried out on Gloucester, news of his death came; that death was probably a violent one. The earls of Derby and Nottingham were spared and raised to the dignities of Duke of Hereford and of Norfolk. Extensive powers were surrendered by Parliament to the king and his triumph was complete. A quarrel between Hereford and Norfolk led to their banishment from England in 1388 and on the death of Hereford's father, John of Gaunt, Richard seized the Lancastrian estates. In May he went to Ireland for the settlement of the affairs of that country and Hereford seized the opportunity of invading England, ostensibly for the purpose of recovering his estates. When Richard landed in England in August, he found himself abandoned by his followers and Henry of Lancaster in possession of power. On 19 August he gave himself up to Henry at Flint in Wales. He was brought to London and on 29 September resigned the crown in favor of Henry, who, on the following day, took the royal title with the consent of Parliament. Richard was sentenced to strict imprisonment and was removed to Henry's castle of Pontefract. There he died, probably by violence, though his body was publicly exposed to refute the charge. Richard was a patron of Chaucer and Gower and was favorably inclined to the teachings of Wyclif. Consult Wallon, *'Richard II,'* (1864); Stubbs, *'Constitutional History of England,'* Vol. II (4th ed. 1896).

RICHARD III, king of England: b. Fothering Castle in Northamptonshire, 2 Oct. 1452; d. Bosworth, Leicestershire, 22 Aug. 1485. He was the youngest son of Richard, Duke of York, and upon the accession of his brother to the throne as Edward IV, he was created Duke of Gloucester and received the grant of extensive lands with the office of admiral. With Edward he fled to Holland in 1470, and with him returned in the following year, commanding the Yorkist vanguard against the Lancastrian forces at Barnet and Tewkesbury, where he distinguished himself by his courage and skill. There, too, he gave signs of his innate ferocity, by his execution of the Lancastrian commander Somerset and others. The murders of Edward, Prince of Wales, after Tewkesbury, and that of Henry VI, in the Tower, are also ascribed to him. Richard became grand-chamberlain of England, and, marrying Anne, the younger daughter of Warwick, fell into violent disputes with his brother Clarence who was the husband of an elder daughter. The death of Clarence in 1478, for which Gloucester cannot be made directly responsible, greatly enriched the latter. In 1480 he became lieutenant-general of the

north and in 1482 carried on a victorious campaign in Scotland. Edward IV died in April 1483 leaving Richard as guardian of his 13-year-old son Edward and protector of the kingdom. Richard's first move after securing possession of the king was to seize the queen-mother's relatives, who were soon after sent to execution. Lord Hastings, who at first sided with Richard but showed signs of disaffection at his ambitious schemes, was likewise put out of the way. With the aid of the Duke of Buckingham Richard began openly to work for the crown. Doubts were cast on the legitimacy of Edward IV's children and in June a subservient Parliament asked Richard to assume the crown. This he did 26 June, though the coronation did not take place till 6 July. Soon after the young sons of Edward IV were done to death in prison. Buckingham now began to plot against Richard and in October stirred up an insurrection in Wales and the southern counties, but the movement collapsed and Buckingham was sent to the scaffold (2 Nov. 1483). More than a year of peace followed during which Richard acquired much popularity by his wise legislative measures and energetic administration. Early in August 1485, Henry, Earl of Richmond, Lancastrian claimant for the throne, landed in England, and Richard going to meet him was defeated and slain at Bosworth Field, after a display of heroic valor. The popular conception of him as a dwarf and hunchback rests on no good authority. Undeniably he was a man of fine powers and bid fair to become one of England's ablest rulers; undeniable, too, however, are his ruthless ferocity and total lack of moral consciousness. Consult 'Letters and Papers of the Reigns of Richard III and Henry VI,' edited by Gairdner (Rolls Series 1861-63); Fabyan, 'The New Chronicles of England and France' (1811); Walpole, 'Historic Doubts on the Life and Reign of Richard III,' (1768); Legge, 'The Unpopular King: Life of Richard III' (1835); Jesse, 'Memoirs of Richard III' (1862); *English Historical Review*, Vol. V (1891); Gairdner, 'Life and Reign of Richard III' (1898).

RICHARD DE BURY. See **AUNGERVILLE, RICHARD.**

RICHARD CARVEL, a historical novel by Winston Churchill, published in 1900. It is a story of the Revolutionary period and the hero, Richard Carvel, spends his early life in Maryland, where he is brought up by his grandfather, an ardent supporter of King George. The climax of the story is reached in a brilliant description of the victory of the *Bon Homme Richard* over the *Serapis*, in which battle Carvel is severely wounded.

RICHARD OF CIRENCESTER, *sis'è-tèr*, English chronicler of the 14th century. All that is known of his life is that he entered the Benedictine monastery of Saint Peter's, Westminster, and was there in 1350; that in 1391 he obtained permission from his abbot to make a visit to Jerusalem; and that he died in his monastery in 1400 or 1401. He is the author of 'Speculum Historiale de Gestis Regum Anglie,' a compilation from other chronicles, giving an account of the kings of England from 447 to 1066. His name is best known, however, in connection with a forgery of the 18th century. In 1747 Charles Bertram, an English teacher in

Copenhagen, wrote to the well-known English antiquary, Stukeley, that a friend of his had a manuscript work on Roman Britain, by a monk named Richard of Westminster, and a transcript of the manuscript was subsequently forwarded, with a few lines in facsimile. The author was soon identified with Richard of Cirencester, who henceforth passed for the writer of a valuable Latin treatise, 'De Situ Britannie.' The work was published in Copenhagen in 1757 and passed as authentic until B. B. Woodward, librarian of Windsor Castle, exposed the forgery in 1866.

RICHARD PLANTAGENET, *plân-táj'è-nèt*, EARL OF CORNWALL, titular emperor of Germany, younger son of King John of England: b. Winchester, Hampshire, 5 Jan. 1209; d. Kirkham, Lancashire, 2 April 1272. He fought against France, in the army of his brother Henry III, went on a crusade to Palestine, and on his return to England in 1242 again assisted his brother in a war against France, but was soon after deprived of his French domain Guienne. In 1256 he was chosen emperor of Germany by a faction while the opposing party declared Alfonso X emperor. He was crowned king of the Romans in 1257, but was unable to obtain general recognition though he exercised all the rights of a sovereign. In 1264 he returned to England to assist his brother and was taken prisoner at the battle of Lewes, 13 May 1264. He returned to Germany in 1268, held a diet at Worms in 1269, after which he returned to England. He was one of the ablest and wealthiest princes of his day. Consult Lorenz, 'Deutsche im 13. und 14. Jahrhundert' (1863-67); Schirmacher, 'Die letzten Hohenstauffen' (1871); Koch, 'Richard von Cornwall 1209-57' (1888).

RICHARD ROE. See **DOE, JOHN.**

RICHARDS, *rich'ardz*, Charles Brinckerhoff, American engineer: b. Brooklyn, N. Y., 23 Dec. 1833. He was educated privately, and for many years was superintendent of the Colt's Arms Company at Hartford. He occupied a similar post with the Southwark Foundry and Machine Company at Philadelphia in 1880-84, was consulting engineer for numerous public buildings and since 1884 has filled the chair of mechanical engineering at Yale. He invented in 1861 the indicator for steam-engines, which bears his name; was one of the United States expert commissioners at the Paris Exposition in 1889, and prepared a large share of their official report; and is a member of various American and European scientific societies. He was editor of engineering and technical terms in Webster's 'International Dictionary.'

RICHARDS, Ellen Henrietta Swallow, American chemist and educator: b. Dunstable, Mass., 3 Dec. 1842. She was graduated from Vassar in 1870, from the Massachusetts Institute of Technology in 1873, and in 1875 was married to Robert Hallowell Richards. She has been an instructor at the Massachusetts Institute of Technology since 1876, is chemist of the Manufacturers' Mutual Fire Insurance Company, and is also a specialist in water analysis. She has published 'Chemistry of Cooking and Cleaning' (1882); 'The Cost of Living' (1899); 'Air, Water and Food' (1900), etc.

RICHARDS, Herbert Maule, American botanist, brother of Theodore William Richards (q.v.): b. Germantown, Pa., 6 Oct. 1871. He was educated at Harvard and Leipzig, and later traveled in Java, Japan, China, Straits Settlements and the Malay Archipelago. After occupying different positions at Harvard, Radcliffe, Columbia and Barnard he became professor of botany at Barnard in 1906. He has specialized in plant physiology.

RICHARDS, John Morgan, American author: b. Aurora, N. Y., 16 Feb. 1841; d. 11 Aug. 1918. He was educated in the public schools and early entered business life. He was connected with different commercial interests in the United States until 1867, when he took up his residence in England. He was chairman of the firm John Morgan Richards and Sons, London; and in 1888-1905 was owner of *The Academy*. Author of 'With John Bull and Jonathan, Sixty Years of an American's Life in England and the United States' (1905); 'The Life and Letters of Mrs. Craigie (John Oliver Hobbes)' (1911); 'Almost Fairyland' (1914).

RICHARDS, Joseph William, American metallurgist: b. Oldbury, England, 28 July 1864. He was educated at the Central High School, Philadelphia; Lehigh University, and at Heidelberg and Freiberg. He was connected with the faculty of Lehigh University from 1887, and since 1903 has been professor of metallurgy there. He was professor of electro-chemistry at Franklin Institute, Philadelphia, in 1907-10; and from 1915 was a member of the United States Navy Consulting Board. Author of 'Aluminium' (1887; 3d ed., 1895); 'Metallurgical Calculations: Part I, General Metallurgy; Part II, Iron and Steel; Part III, Non-ferrous Metals' (1907-08), etc.

RICHARDS, Laura Elizabeth Howe, American writer of juvenile fiction: b. Boston, 1850. She is a daughter of Mrs. Julia Ward Howe (q.v.), and was married in 1871 to Henry Richards of Gardiner, Me., where she has since resided. Among her numerous popular works are 'The Joyous Story of Toto' (1885); 'Queen Hildegard' (1889); 'Captain January' (1890); 'Melody' (1893); 'When I Was Your Age' (1893); 'Three Margarets' (1897); 'Snow White' (1900); 'The Green Satin Gown' (1903); 'The Merryweathers' (1904); 'Letters and Journals of Samuel Gridley Howe' (2 vols., 1906-09); 'The Wooing of Calvin Parks' (1908); 'Florence Nightingale' (1909); 'Aboard the Mary Sands' (1911); 'Two Noble Lives' autobiographical of her father and mother (1911); 'The Little Master' (1913); 'Three Minute Stories' (1914); and with her sister Maude Howe Elliott, 'Julia Ward Howe' (1915).

RICHARDS, Robert Hallowell, American mining engineer: b. Gardiner, Me., 26 Aug. 1844. He was graduated at the Massachusetts Institute of Technology in 1868, and was connected with the faculty of that institution from 1868, becoming professor of mineralogy and assaying in 1871; professor of mining engineering in 1873; and emeritus professor in 1914. He invented a jet aspirator for chemical and physical laboratories in 1873; a prism for stadia surveying in 1890; and several ore separators

for copper and iron ores. Author of 'Ore Dressing' (4 vols., 1903-09); 'Ore Dressing' textbook (1909).

RICHARDS, Theodore William, American chemist: b. Germantown, Pa., 31 Jan. 1868. He was educated at Haverford College, Harvard, Göttingen, Leipzig and Dresden. He was a member of the faculty at Harvard from 1894, becoming professor of chemistry in 1901, and director of Gibbs Memorial Laboratory in 1912. He was exchange professor from Harvard to Berlin in 1907, and adviser of the Carnegie Institute Research Association from 1902. He has specialized in atomic weights and in physical and inorganic chemistry. He was Nobel laureate in chemistry in 1914.

RICHARDS, Thomas Addison, author and artist: b. London, 3 Dec. 1820; d. Annapolis, 29 June 1900. He came to the United States in 1831 and settled in Georgia. He studied art at the National Academy in New York with Daniel Huntington, and at an early age began writing and illustrating for publication. He organized the Woman's School of Design at Cooper Union in 1859 and was its first director. In 1868 he became professor of art in the University of the City of New York and after 25 years' service was made professor emeritus. He was a constant exhibitor at the National Academy of Design, became an associate in 1848, an academican in 1851, and was member of the council and corresponding secretary 1852-92. In the early 50's he was a frequent contributor of pictures and text to *Harper's Magazine*, describing in his articles scenes in the United States and the homes of American authors. His landscape paintings produced in many parts of the United States and Europe are illustrative rather than creative. He was the author and illustrator of 'The American Artist' (1848); 'Georgia Illustrated' (1851); 'Romance of American Landscape'; 'Summer Stories of the South'; 'Pictures and Painters.'

RICHARDS, William, American missionary and Hawaiian diplomat: b. Plainfield, Mass., 22 Aug. 1792; d. Honolulu, 7 Dec. 1847. He was graduated at Williams College in 1819 and at Andover Theological Seminary in 1822. He was then ordained and in November 1822 started on his journey to the Hawaiian Islands where he became a missionary. His work was highly successful, but in 1838 he resigned his missionary duties in order to become councilor, chaplain and interpreter to the Hawaiian king. He was special Ambassador to England on a mission to secure recognition of the independence of the islands by foreign powers, and after the successful conclusion of his errand he returned to Honolulu and from 1845 until his death he was Minister of Public Instruction.

RICHARDS, Sir William Buell, Canadian jurist: b. Brockville, Ontario, 2 May 1815; d. Ottawa, 26 Jan. 1889. He was admitted to the bar in 1837 and practised law at Brockville. In 1848 he was elected to the Canadian Parliament, and in 1851 was appointed a member of the Executive Council. He was appointed queen's counsel in 1850, and in 1853 became puisné judge of the Court of Common Pleas, Ontario, receiving the office of chief justice of that court in 1863, and that of chief justice of Ontario in 1868. He was chief justice of the

Supreme Court of Canada in 1875-79; and then retired. He was knighted in 1878.

RICHARDS, William Trost, American artist: b. Philadelphia, 14 Nov. 1833; d. Newport, R. I., 8 Nov. 1905. He first studied under Paul Weber and in 1855 went abroad for observation and study in Italy and Paris, establishing a studio in Philadelphia in 1856. In his landscapes he adopted the minute method of drawing characteristic of the English Pre-Raphaelites, though he resembled them in no other respect, his subjects being transcripts rather than composed pieces. His greatest success was in his marines where he carefully studied the motion of waves in storm and calm. He painted numerous subjects along the Atlantic Coast, especially near Newport, where he later lived. He exhibited at the Royal Academy, London, at the Paris Salon and the various American expositions. He was a member of the National Academy of Design. A series of his water-color marines hangs in the Metropolitan Museum, New York.

RICHARDSON, Sir Benjamin Ward, English physician: b. Somerby, Leicestershire, 31 Oct. 1828; d. London, 21 Nov. 1896. He was educated at Anderson College, Glasgow and Saint Andrews University, and in 1855 removed to London and for three years was lecturer on medical jurisprudence at the School of Medicine in Grosvenor Place, and until 1865 lecturer on physiology. Sanitary reform and methods of producing anaesthesia were the two fields in which he was especially interested. Of the 14 anaesthetics that he brought into use methylene bichloride is most widely known. He introduced the ether spray for local anaesthesia, and the lethal chamber for the humane extinction of the life of animals. He also discovered the properties of amyl nitrite and introduced a number of bromides and other substances into use by the medical profession. He was a strong advocate of total abstinence from the use of alcohol, on the ground that its power as a drug required the greatest caution in its use. Aside from his scientific writing he produced biographies, plays and poems. The 'Asclepiad,' a series of original researches in the science, art and literature of medicine, was written entirely by himself and appeared quarterly from 1884 to 1895. Besides works already mentioned he wrote 'Diseases of Modern Life' (1876); 'National Health' (1890), etc.

RICHARDSON, Charles Francis, American educator: b. Hallowell, Me., 29 May 1851. He was graduated at Dartmouth in 1871, was editor of the *New York Independent* in 1872-78, of the *Philadelphia Sunday School Times* in 1878-80, and of *Good Literature*, New York, in 1880-82. Since 1882 he has occupied the chair of English at Dartmouth. He has published 'A Primer of American Literature' (1878); 'The Cross,' poems (1879); 'The Choice of Books' (1881); 'American Literature 1607-1885' (1886-88); 'The End of the Beginning' (1896), etc.

RICHARDSON, Clifford, American chemical engineer: b. Worcester, Mass., 6 March 1856. He was graduated at Harvard in 1877, and was a member of the United States Geological Survey in 1878. In 1878-87 he was assistant chemist in the United States Department of Agriculture. He was superintendent

of tests for the Barber Asphalt Paving Company in 1896-1900, and owner of the New York Testing Laboratory in 1900-10. He is an expert in asphalt, bitumen and Portland cement. Author of 'On American Cereals' (1883, 1884, 1886); 'On the Nature and Origin of Asphalt' (1898); 'The Modern Asphalt Pavement' (1905; 2d ed., 1908), etc.

RICHARDSON, Ernest Cushing, American librarian: b. Woburn, Mass., 9 Feb. 1860. He was graduated at Amherst in 1880 and at Hartford Theological Seminary. In 1883-90 he was professor and librarian at the latter institution and since 1890 has been librarian at Princeton. He was American editor of Berner's 'Jahresberichte d. Geschichtswissenschaft'; critical editor of 'Hieronymus w. Gennadius de Viris Illustribus' (1896); and wrote 'Biographical Synopsis of the Ante-Nicene Fathers' (1887); 'Classifications, Theoretical and Practical' (1901).

RICHARDSON, Henry Hobson, American architect: b. Parish of Saint James, La., 29 Sept. 1838; d. Boston, 27 April 1886. He was graduated at Harvard in 1859 and in the following year went to Paris and entered the Ecole des Beaux Arts. Throughout his student life in Paris he worked under the instruction of L. J. André, and when his private fortune was swept away by the Civil War he secured through André's friendship an appointment in a government office in Paris. In 1865 he returned to the United States and located his business in New York. His first commission, received in October 1866, was for building the Church of the Unity in Springfield, Mass. The design of this church is the only instance of his following Gothic models; and this, which may in general terms be typical of the English Rural Gothic, yet presents certain independent features that show the practical bent of his mind. Shortly afterward he built the Boston and Albany Railroad office in the same city and Grace Church in West Medford. In October 1867 he formed a partnership with Charles Gambrill which lasted until October 1878. The works of this period, which include several of his more important ones, and especially Trinity Church in Boston, were projected under the firm name, though with few exceptions were the conceptions of Richardson. In 1870 the commission was received to build the Brattle Street Church in Boston and the design he produced, Romanesque in general character, may be regarded, however, as rather transitional to that style that he worked in so consistently in the latter part of his life, and which received its first confirmation in the North Church of Springfield, built by him in 1872. The Brattle Street Church, now known as the First Baptist Church, has a fine tower ornamented below the upper arcade by a bold sculptured frieze. The church itself is ineffective in respect to the relations of its general masses with this superb tower, and, its acoustic properties being imperfect, the work is judged a partial failure.

Trinity Church in Boston was begun in 1872 and finished in 1877. This church shows the perfection of his individual style evolved from his study of the Romanesque churches of southern France. It is cruciform in plan, but its distance from apse-wall to façade is

only about 39 feet in excess of the distance between the two walls of the transepts. This innovation in church architecture has had a powerful effect upon subsequent designs. After Trinity he produced only two other, and these comparatively unimportant churches, though he entered the competition for the Cathedral Church at Albany. His subsequent work was in the designing of municipal or commercial structures, and of these the one by which he wished to be judged was the Allegheny County buildings—courthouse and jail, of Pittsburgh, Pa. These structures, however, he did not live to see completed. Other buildings designed by him are Sever Hall, and the Law School of Harvard University; the city hall at Albany; parts of the New York State capitol at Albany, in which he was associated with Leopold Eidlitz and Frederick Law Olmsted, his individual work being the senate chamber, the governor's room, the Court of Appeals chamber and the western staircase; the chamber of commerce at Cincinnati and the Field building at Chicago. Other buildings such as stores, railway stations, public libraries and private dwellings were designed by him. Consult Van Rensselaer, 'Henry Hobson Richardson and His Works' (1888).

RICHARDSON, Sir John, Scottish naturalist and Arctic explorer: b. Dumfries, Scotland, 5 Nov. 1787; d. Lancrigg, near Grasmere, Scotland, 5 June 1865. He was educated at the University of Edinburgh and in 1807 entered the navy as assistant surgeon. In 1819 he was appointed surgeon and naturalist to Sir John Franklin's expedition to Hudson Bay and the Coppermine River. He was appointed surgeon of the Royal Marines at Chatham in 1824, but accompanied Franklin on his second Arctic expedition in 1825, resuming his duties at Chatham in 1827. He was knighted in 1846 and in 1848 set out with Rae in search of Franklin. The search was fruitless so far as finding trace of Franklin, but Richardson gained valuable information concerning the physical conditions of North America. In 1855 he resigned his position as surgeon to the Hasler Hospital at Gosport, which he had held since 1838. He was author of the articles 'Ichthyology' and 'Franklin' for the 'Encyclopedia Britannica'; Vols. I and III of 'Fauna Boreali-Americana'; and also published 'A Voyage Through Rupert's Land and the Arctic Sea' (1851); 'The Polar Region' (1861), etc.

RICHARDSON, John, Canadian author: b. near Niagara Falls, Ontario, 1797; d. United States, about 1863. He served in the Canadian militia in the War of 1812, and later entered the British army, taking part in actions in Spain and attaining the rank of major. He returned to Canada in 1838 and founded *The New Era* at Brockville, Ontario, in 1840. He removed to Kingston in 1843 and established *The Native Canadian* there, continuing its publication until 1845. He also served for a time as special correspondent for the *London Times*. He removed to the United States after 1845 and was there engaged in journalism until his death. Author of 'Wacusta' (1832); 'Eight Years in Canada' (1847); 'The Guards in Canada' (1848); 'The Monk Knight of Saint John' (1850); 'Wau-nan-gee' (1852), etc.

RICHARDSON, Maurice Howe, American surgeon: b. Athol, Mass., 31 Dec. 1851; d. 31 July 1912. He was graduated at Harvard in 1873 and took his M.D. there in 1877. He was engaged in the practice of surgery at Boston from 1876 until his death, and attained a foremost place among American surgeons. He was a member of the medical faculty at Harvard from 1879, and was visiting surgeon to the Massachusetts Hospital from 1886. He contributed to Parks' 'Surgery by American Authors'; and to Dennis' 'System of Surgery.'

RICHARDSON, Owen Williams, American physicist: b. Dewsbury, England, 26 April 1879. He was educated at the universities of Cambridge and London, and was a fellow of Trinity College, Cambridge, in 1902-08. In 1906-13 he was professor of physics at Princeton University, and since 1913 has occupied that chair at King's College, London. Author of 'Electron Theory of Matter' (1914); 'Emission of Electricity from Hot Bodies' (1916).

RICHARDSON, Rufus Byam, American archaeologist: b. Westford, Mass., 18 April 1845. He was graduated at Yale in 1869, studied divinity at Yale 1869-72, and at Berlin 1872-74. He was professor of Greek at the University of Indiana 1880-82, and at Dartmouth 1882-93, and since 1893 has been director of the American School of Classical Studies at Athens, Greece. He edited *Æschines' 'Oration Against Ctesiphon'* (1889); and contributed frequently to the 'American Journal of Archaeology' (1892-1902). He wrote 'Vacation Days in Greece' (1903).

RICHARDSON, Samuel, English novelist: b. Derbyshire, 1689; d. Parson's Green, near London, 4 July 1761. Up to the age of 50 the life of Richardson was not only uneventful, but undistinguished. The son of a joiner of the better class, who had moved from London owing to circumstances vaguely connected with Monmouth's rebellion, there is no clear evidence that he ever had more than what he calls "common school learning." His father's means did not permit him to take orders, but as a concession to an early taste for reading, he was, when the family returned to the metropolis, apprenticed to John Wilde, an Aldersgate street printer. Here he exhibited the usual traits of the exemplary apprentice; proceeded, in due course, compositor, corrector, overseer, and master; and, as in duty bound, eventually married his employer's daughter. From Fleet street, where he first began business, he moved to Salisbury Court (now square); set up newspapers and books; worked on the publications of the Society for the Encouragement of Learning; and advanced generally in an industrious career. His first wife dying in 1731, he married again, his second wife being the sister of James Leake, a Bath bookseller. Children were born to him by both his wives; but he was well past middle life before he had acquired any literary reputation, although he had long been known to his friends as what Goldsmith calls "a dab at an index," a clever compiler of opportune prefaces and "honest dedications," and, above all, a copious and indefatigable letter-writer.

This, from his childhood, had been his hobby. As a boy he was the chartered secre-

tary of all the love-sick girls in the neighborhood; as a printer's apprentice he had corresponded voluminously with a gentleman who was a "master of the epistolary style"; and it is characteristic of the qualities he afterward developed as a novelist, that his communications were always of the moral or improving order. Out of these things arose his first literary effort. Two bookseller friends, Rivington and Osborn, suggested to him the preparation of a model letter-writer. Richardson at once went farther by proposing that the letters should teach those concerned to think as well as write. Such was the origin of the little-known volume of 'Familiar Letters' issued in January 1741. Before it was finished, one of the model epistles, coupled with the recollection of something he had heard some 20 years before, led him to the composition of a story, also in letters, dealing with the triumphs of chastity in humble life. The idea rapidly grew into the famous 'Pamela; or, Virtue Rewarded' (1740), which not only obtained an immediate and unexampled success, but by superadding to the patient realism of Defoe a power of minute mental analysis which Defoe did not possess, set a new fashion in fiction. It is this latter quality, together with the transfer of the fable from the impossible land of heroic romance to the very probable region of ordinary life, which gives the Salisbury Court printer his claim to have invented the novel of sentimental analysis as opposed to the novel of manners. Despite the moral professions of 'Pamela' many of its scenes are needlessly indelicate; and the final union of the heroine to the man who has repeatedly attempted her ruin is unpleasant,—to say nothing of the fact that there is a sordid air of calculation about the virtue she so vigilantly preserves. But dealing, as the story did, with real people in a real way, in what was, moreover, a dead season of letters, the book's success is not surprising. Fine ladies raved about it in public places. Clergymen praised it from the pulpit. Pope, sincerely or insincerely, declared it "would do more good than many volumes of sermons," and the voices of the continuer and parodist were speedily heard in the land.

Of the inevitable sequel, 'Pamela's Conduct in High Life,' by John Kelly of the *Universal Spectator*, nothing need be said, save that it forced Richardson upon a continuation of his own, now deservedly neglected. But among the numerous publications prompted by 'Pamela's' more assailable side, two in particular require to be mentioned. One was 'An Apology for the Life of Mrs. Shamela Andrews,' a clever but very gross attack upon the inner morality of the heroine. Richardson himself attributed this to Fielding, as did other of his contemporaries; but Fielding is never known to have acknowledged it. Ten months later Fielding issued 'Joseph Andrews,' which at all events set out with the open intention of burlesquing Richardson, although its writer promptly abandoned this inadequate motive with the development of more important characters than Pamela Booby, a name which, both in 'Shamela' and 'Joseph Andrews,' is cruelly filled in from Richardson's hero, "Mr. B." Either of these performances was sufficient to be a thorn in the side of 'Pamela's' sensitive author. But probably the worst thorn of all was

the success of Fielding's 'Tom Jones,' which appeared not long after Richardson's next novel 'Clarissa.'

'Clarissa; or the History of a Young Lady,' usually misnamed 'Clarissa Harlowe,' was published in 1747-48, in seven volumes and three instalments. The story, which deals with the "Distresses that may attend the Misconduct both of Parents and Children in Relation to Marriage," is an intensely tragic one. The heroine, a very pure and beautiful woman, is deliberately hunted down by a relentless seducer, whose eventual death at the hand of her guardian only faintly satisfies poetical justice. But in this book Richardson rises to the height of his powers. Encumbered by a story to be told in letters, and trammelled with his own prolixity, he nevertheless contrives to hold his readers fascinated, not only with the fortunes of his heroine but with the individuality of her despicable but dazzling pursuer, who is drawn with surpassing dexterity. The intermittent mode of publication added flame to the public interest in the issue; and the writer was bombarded with appeals for a "happy ending." As to this, he showed more artistic fortitude than might have been expected. Imperfect as his education had been, he had learned from the *Spectator* that to "make virtue and innocence happy and successful" was to defeat one of the great ends of tragedy, "the raising of commiseration and terror in the minds of the audience." So Clarissa Harlowe dies elaborately of a broken heart; and her history remains a masterpiece.

By this time Richardson was nearing 60, and might reasonably have held his hand. But the welcome accorded to Fielding's 'Tom Jones,' coupled with the importunities of his coterie of lady friends, soon engaged him in a third effort, the object of which was to delineate a model good man and fine gentleman combined. This was the 'History of Sir Charles Grandison' (1753-54), a book which still has its admirers, though it does not by any means attain the tragic level of 'Clarissa.' That the hero of such a work should be something of a prig is inevitable; but he has many estimable qualities which are not ridiculous; and he is surrounded by a bevy of female worshippers who are drawn with unquestionable skill. Neither Clementina nor Harriet Byron could have been conceived by an inferior artist. It is easy to make fun of the little printer's superexcellent central figure; but there must, in spite of his long-windedness, have been something in the personage who could attract the admiration of both Ruskin and the Master of Balliol.

Beyond a very popular paper in Johnson's *Rambler*, Richardson wrote nothing more of importance. He continued to prosper in his business, made money, became Master of the Stationers' Company, and eventually Law Printer to the king. He was a nervous, inoffensive, sensitive valetudinarian, delighting in the stimulus of feminine adulation rather than in the robust criticism of his own sex. His style is hopelessly pedestrian and diffuse; but it has an extraordinary cumulative power which attracts, and by degrees detains, the persevering reader. His faculty of minute imagination is wonderful; and he gradually acquired an extraordinary insight into the workings of the

female heart. The English fiction which followed developed itself on somewhat different lines; but it is impossible to deny to him the credit of inaugurating the novel of sentimental analysis, which for a time became the fashion, even more in France and Germany than in England. See CLARISSA HARLOWE.

Bibliography.—Richardson's life has been written by Mrs. A. L. Barbauld, 'Memoir' prefixed to 'Correspondence' (6 vols., 1804); by Miss C. L. Thomson (1900), and by Austin Dobson, 'English Men of Letters' (1902). Consult also Scott's 'Lives of the Novelists' (1825); Mrs. Oliphant, *Blackwood's Magazine* (March 1869); H. D. Traill, *Contemporary Review* (October 1883), and Texte's 'Jean Jacques Rousseau,' etc. (1895). There are editions of his novels by Rev. E. Mangin (1811); Sir Leslie Stephen (1883); Mrs. McKenna (1901), and Prof. W. L. Phelps of Yale. There are several portraits of Richardson by the painter Joseph Highmore.

AUSTIN DOBSON,

Author of 'Life of Richardson,' etc.

RICHARDSON, Tobias Gibson, American surgeon: b. Louisville, Ky., 1827; d. 1892. He took his M.D. at the University of Louisiana in 1848 and later occupied the chairs of anatomy and surgery there. He practised for a time in Philadelphia, where he was a member of the College of Physicians and of the American Surgical Association. In 1851, before the use of anesthetics and antiseptics, he successfully extirpated the thyroid gland, the first successful case recorded. He occupied the chair of surgery at Tulane University, New Orleans, in 1858-92; and in 1878 was president of the American Medical Association. He wrote many articles and reports for scientific journals and for the 'Transactions' of the American Medical Association and the American Surgical Association, and was author of 'The Elements of Human Anatomy' (1854).

RICHARDSON, William Adams, American jurist: b. Tyngsboro, Mass., 2 Nov. 1821; d. Washington, D. C., 19 Oct. 1896. He was graduated at Harvard in 1843, later studied law there and in 1846 was admitted to the bar. He was appointed judge-advocate and governor's aide in Massachusetts; and in 1855 revised the statutes of the State, afterward editing the annual supplements of the general statutes until 1877. He was named judge of probate in 1856, and also judge of insolvency in 1858-72. He became Assistant Secretary of the United States Treasury in 1869 and Secretary in 1873. He resigned in 1874 to accept an appointment as justice of the United States Court of Claims, of which he was chief justice in 1885-96. He was lecturer and professor in the Georgetown Law School, District of Columbia. Author of 'The Banking Laws of Massachusetts' (1855); 'Practical Information Concerning the Debt of the United States' (1872); 'History of the Court of Claims' (1882-85), etc.

RICHELIEU, Armand Jean du Plessis de, ār-mān zhōn dü plēs-sē rēsh-lē-e, Eng. rēsh'loo, Cardinal, Duc de, French prelate and statesman: b. Paris, according to Jal, who cites a register of baptism, 9, not as usually stated, 5 Sept. 1585; d. Paris, 4 Dec. 1642. Armand was the third son; his father lost his life at the

siege of Paris, 10 July 1590, and the mother was left with five children and an estate heavily encumbered with debt. By practising careful economies she liquidated the debt and brought up the children as befitted their rank. In 1594 the future cardinal entered the Collège de Navarre, Paris, where he made a brilliant course in grammar and philosophy. He next entered a "finishing school" in preparation for the life of a courtier and where his training was directed toward a military career. This career was cut short when Alphonse, his elder brother, refused the bishopric of Luçon, preferment to which had been vested in the Richelieu family by Henry III. Armand was thereupon induced to enter the Church. At 21, in 1606, Henry IV nominated him bishop of Luçon. He obtained from the Pope a dispensation allowing him to accept the office though under age, and on 16 April 1607 was consecrated by the Cardinal de Givry in presence of the Pope himself (Paul V). For several years he devoted himself to the duties of his see, reforming abuses and laboring for the conversion of Protestants. But his ambition always made him turn his eyes toward the court, and having come to Paris in 1614 as deputy of the clergy of Poitou to the States-General he managed to insinuate himself into the favor of the queen-mother, who obtained for him the post of grand-almoner, and in 1616 that of Secretary of State for War and Foreign Affairs. On the disgrace of the queen-mother (1617) Richelieu fell with her, and was banished first to Blois and then to Avignon. In 1620 he managed to effect a reconciliation between Mary of Medici and her son, Louis XIII. On 5 Sept. 1622 he obtained through her influence the cardinal's hat, and on 19 April 1624 was admitted into the Council of State. No sooner was Richelieu secure in his high post than he began systematically to extend the power of the Crown by crushing the Huguenots and overthrowing the privileges of the great vassals, and to increase the influence of the French monarchy by undermining that of the Hapsburgs, both beyond the Pyrenees and in Germany. Louis XIII, sensible of the energy of his Minister, favored his plans, though he always showed a dislike for the man, whom he would gladly have destroyed had he been able to govern without him. The Huguenots had for a long time resisted the royal power; and bloody insurrections, in several preceding reigns had arisen from their struggles in their attempts to gain political and religious power. The wisdom and mildness of Henry IV had, indeed assuaged the excitement of the contending parties, but his reign was too short to extinguish the fires. Richelieu resolved to crush the weaker by the aid of the stronger party, and thus to deprive those who should be disposed to resist his schemes of their main prop. The rallying-point of the Huguenots was Rochelle and Richelieu neglected no means to make himself master of that city. In the celebrated siege of Rochelle he commanded the army in person.

Rochelle, supported by England, from which it continually received supplies, held out for long time against all the efforts of the cardinal and the hope of reducing it was already nearly abandoned, when Richelieu, by the erection of an immense mole, cut off the communication

by sea, and finally compelled it to surrender by famine (1628). It would be a mistake to see in this war that Richelieu waged against the Huguenots an example of religious intolerance, for although this would have been quite in keeping with the spirit of his time, Richelieu was, with respect to this matter, in advance of his age. He destroyed the political consequence of the Huguenots as a separate body within the state, but by the Peace of Alais or Edict of Grace, which concluded the war (June 1629), he left them liberty of worship and equality of civil rights, and throughout his ministry employed them, with other citizens, in the army, the magistracy and offices, connected with the revenue. During the continuance of this war Richelieu had taken various steps in pursuance of the other main end of his internal policy, the overthrow of the power of the great nobles. In 1626 he ordered the demolition of all those feudal fortresses which could not be used for the defense of the frontiers, and which were a perpetual menace to the Crown. The next step was the removal from court of the queen-mother who had become hostile and endeavored to obtain Richelieu's downfall. Saint Simon represented to the king the services of Richelieu and the impossibility of dispensing with his aid. Louis, therefore, ordered him to Versailles, and assigned him apartments in the palace directly below his own. This day (10 Nov. 1630), on which the hopes of the queen and of the cardinal's enemies were disappointed, was called the "Day of the Dupes" ("la Journée des Dupes"). The queen-mother was banished to Compiègne, her friends removed from place and some of them thrown into the Bastille. This step, and the almost total annihilation of the privileges of the parliaments and the clergy, excited all classes against the despotic administration of the cardinal, and the discontent broke out in numerous risings and conspiracies, which, however, were not only suppressed by the prudence and vigor of his measures, but also contributed to the furtherance of his plans, and gradually rendered the royal power entirely absolute. In 1632 the royal arms, directed by Richelieu (in the previous year raised to the rank of duke), suppressed the rising in favor of the Duke of Orleans, the king's brother, to which the Duke of Montmorency had been induced to lend his support. Even those whom the king privately favored were obliged to yield to the all-powerful Minister, and paid with their lives for their rashness in venturing to oppose him, as in the instance of Cinq-Mars, who in 1642 had entered into a conspiracy against him, which the king was, not without reason, believed to have favored. While the Minister was thus extending the power of the Crown at home he did not neglect the aggrandizement of the monarchy abroad. The Thirty Years' War gave him an opportunity of effecting this object. The same man who pursued, with the greatest severity, the Protestants in France, employed all the arts of negotiation, and even force of arms, to protect the same sect in Germany, for the purpose of humbling the house of Austria. In the early stages of the war he subsidized Count Mansfield. Subsequently Gustavus Adolphus, king of Sweden, the great bulwark of religious liberty in Germany, re-

ceived aid of every kind from Richelieu as long as he was not in danger of becoming formidable to France; but when the brilliant victories of Gustavus gave the cardinal reason to consider his power as more dangerous than that of Austria he abandoned that prince in the midst of his successes. The war which he undertook against Spain, and which continued till 1659, put France in possession of Catalonia and Roussillon, and the separation of Portugal from Spain was effected by his assistance (1640).

Richelieu must be allowed to have deserved the character of a great statesman; he cannot be denied the glory of having raised the power of the sovereign in France to its highest pitch; but he was proud, arrogant and vindictive. He was a patron of letters and art, and founder of the French Academy and the Jardin des Plantes. Louis XIII died a few months after him; but in the long reign of Louis XIV the effects of Richelieu's policy were yet visible.

Richelieu was a voluminous writer; his most important works may be consulted in 'Mémoires sur la règne de Louis XIII' (in Collection Petitot, Paris 1823 et seq.); 'Mémoire d'Armand du Plessis de Richelieu, évêque de Luçon, écrit de sa main, l'année 1607 ou 1610,' edited by Baschet, A. (Paris 1880); 'Lettres, instructions, diplomatiques, etc.,' edited by Avenal, G. d' (8 vols., Paris 1853-77); 'Testament politique d'Armand du Plessis, Cardinal de Richelieu' (Amsterdam 1687). For extended biography consult Avenal, G. d', 'Richelieu et la monarchie absolue' (2d ed., 4 vols., Paris 1895); Barrière, J. F., 'Memoirs of the Duke de Richelieu' (New York 1904); Caillet, J., 'L'Administration en France sous le ministère du cardinal de Richelieu' (new ed.; 2 vols., Paris 1863); Fagniez, G., 'Le père Joseph et Richelieu' (2 vols., Paris 1894); Hanoteaux, G., 'Histoire du cardinal de Richelieu' (Paris 1893); Lodge, R., 'Richelieu' (London 1896); Martineau, A., 'Le cardinal de Richelieu' (Paris 1865); Perkins, J. B., 'Richelieu and the Growth of the French Power' (New York 1900); Topin, M. J. F., 'Louis XII et Richelieu' (Paris 1885).

RICHELIEU, (also called **CHAMBLY**, **SOREL** and **SAINT JOHN**), river of Quebec, Canada, leaving Lake Champlain at its northern extremity and flowing in a direct northerly course to Saint Lawrence River, which it enters at the southern end of the widening of the river known as Lake Saint Peter. Near the centre of its course the Richelieu River widens into the basin of Chambly and it is canalized above there in order to avoid the rapids and maintain navigation from the Hudson to the Saint Lawrence. The town of Sorrel lies on its east bank as it enters Lake Saint Peter.

RICHEPIN, resh-păn, **Jean**, French poet novelist and dramatist: b. Médéah, Algeria, 4 Feb. 1849. He began the study of medicine with his father, a physician, but gave it up and entered the Ecole Normale in the department of literature. After 1870 he engaged in journalism, editing *L'Est*, and contributing to *Mot d'Ordre*, the *Corsaire* and *Vérité*, in which latter he published 'Les étapes d'un refractaire.' Shortly afterward he published 'Chanson des Gueux,' for which he was fined and obliged to spend a month in prison, during which time he

wrote 'Morts bizarres.' Works of this character have placed him among the most advanced of the naturalistic school; the boldness of his expression and the license of his subject have brought to him both applause and condemnation. In reply to criticism he admitted in 1881, in defense of his works, that his coarseness was perhaps unnecessary and repugnant, but not immoral. His works include verses under titles such as 'Caresses' (1877); 'Blasphèmes' (1884); 'La mer' (1886); 'Mes paradis' (1894); of romances 'Madame André' (1874); 'Sophie Monnier' (1884); 'Césarine' (1888); 'Bravesgens' (1888), besides many others; and of dramas 'Nina Sahib' (1882); 'Monsieur Scapin' (1886); 'Le Filibustier' (1888); 'Par le glaive' (1892); 'Vers la joie' (1894); 'Cheminéau' (1897). He published also a work entitled 'Théâtre Chimérique' (1896); in 27 acts in prose and verse.

RICHER, ré'shā', Edmond, French Roman Catholic priest: b. Chaource, Sube, 1560; d. Paris, 1631. He was educated for the Church and was a parish priest in 1590-94, when he became director of the College of Cardinal Lemoine. Soon afterward he became also syndic of the Theological Faculty of Paris. While in these positions he opposed the doctrine of the infallibility of the Pope, defending his position in 'De Ecclesiastica et Politica Protestate' (1611; published, 2 vols., 1629). This work brought a furious attack upon him and he was deposed from his offices. The intercession of the university saved him from imprisonment and in 1627, under pressure, he made a retraction of his arguments. He had made further explanation of his position in 'Historia Conciliorum Generalium' and 'Histoire du syndicat de Richer,' published posthumously in 1683 and 1753, respectively. He was also author of 'Apologia pro J. Gersonio' (1674), etc.

RICHER, Paul, French neurologist: b. Chartres, 17 Jan. 1849. He was educated at Paris, taking his M.D. in 1879. From its foundation in 1882 until he resigned in 1895 he was director of the laboratory of the Salpêtrière clinic of nervous diseases. He was elected to the Academy of Medicine in 1898, and was appointed professor of anatomy at the École des Beaux Arts in 1903. He is also well known for his artistic capabilities, is a draughtsman of ability and has written successfully on art topics as well as on medicine. His medical works include 'Études cliniques sur la grande hystérie ou hystéro-épilepsie' (1885); 'Paralysies et contractures hystériques' (1892). He collaborated with his instructor in art in writing 'Les démoniaques dans l'art' (1886); 'Les difformes et les malades dans l'art' (1889), and was sole author of 'Anatomie artistique' (1890); 'Physiologie artistique de l'homme en mouvement' (1895); 'Nouvelle anatomie artistique du corps humain' (1906).

RICHET, ré'shā', Charles Robert, French physiologist: b. Paris, 16 Aug. 1850. He was educated at Paris, taking his degree in medicine in 1877 and in science in 1878. He was connected with the Faculty of Medicine at Paris from 1878, and in 1887 succeeded De Bécclard as professor of physiology. He was elected to the Academy of Medicine in 1899. He achieved a considerable literary reputation not only as a writer on scientific subjects but on international

peace and other subjects, and he also published a volume of verse (1875) under the pseudonym Charles Epheyre. He is famous for his research into the phenomenon which he named "anaphylaxis" (q.v.), which he explained with Portier in 1902. He received the Nobel Prize in Medicine in 1913. Author of 'Les poisons de l'intelligence' (1877); 'Structure des circonvolutions cérébrales' (1878); 'Essai de psychologie générale' (1887); 'Dictionnaire de physiologie' (4 vols., 1895-1906); 'L'Anaphylaxie' (1911); 'Les Guerres et la Paix,' etc.

RICHFIELD, Minn., village in Hennepin County, near Fort Snelling, and forming a suburb of Minneapolis, on the Dan Patch Electric Railroad. It has extensive greenhouses and market gardening interests. Pop. 2,673.

RICHFIELD, Utah, village in county-seat of Sevier County, on Denver and Rio Grande Western Railroad, 135 miles south of Salt Lake City. It was incorporated in 1878. It is the centre of an agricultural and stock-raising region. The public school system includes a high school founded in 1896; there is also an association library. Pop. about 2,700.

RICHFIELD SPRINGS, N. Y., village in Otsego County, on the Delaware, Lackawanna and Western Railroad, about one mile from Schuylers Lake, 25 miles south by east of Utica and 13 miles north by west of Cooperstown. It is in a productive agricultural region; but the village is a well-known health resort on account of its large number of mineral springs. It is also a famous summer resort. Nearby are many places of attraction, as Otsego Lake and vicinity. It has several small manufacturing establishments which more than supply local needs. The place was settled about the middle of the 18th century, but a permanent settlement was not made until after the Revolution. It was one of the favorite localities of the Indian tribes of eastern New York. Pop. about 1,650.

RICHFORD, Vt., town in Franklin County, on the Missisquoi River, and on the Central Vermont and Canadian Pacific railroads, 45 miles northeast of Burlington. It was first settled in 1795 and incorporated as a village in 1878. The town is built on both sides of the river which affords good water power; the lumber interests exceed all others in importance, and there are several lumber, saw and planing mills, furniture factories, butter and dairy products, sugar evaporators, clothing manufactories, etc. It is also in a maple-sugar and agricultural region, and has a good trade, being a port of entry from Canada. The town's real estate is valued at \$1,076,940 and the personal property valuation is \$431,625. There are one graded and six rural schools. The government building contains the post office and custom-house; there is also the town-hall, containing library, clerk's office, public hall, lockup, etc. The customs receipts are about \$100,000 annually, the expenses \$12,000; the post office receipts \$8,000. Pop. 3,000.

RICHLAND CENTER, Wis., city, county-seat of Richland County, on Pine River, and on the Chicago, Milwaukee and Saint Paul Railroad, 55 miles northwest of Madison. It was settled in 1849 and was made the county-seat in 1852. It is the centre of an agricultural, stock-raising and dairying region, and has a

large export trade in flour, cheese, etc. The river furnishes water power for manufacturing, and the city contains flour and saw mills, a tannery and brick kiln. There is a public high school. Pop. about 2,500.

RICHMAN, Irving Berdine, American lawyer and diplomat: b. Muscatine, Iowa, 27 Oct. 1861. He was graduated from the State University of Iowa in 1883 and admitted to the bar in 1885. He was elected to the lower house of the State legislature in 1889 and 1891, and was United States consul-general in Switzerland, with residence at Saint Gall, 1893-98. He has published 'John Brown Among the Quakers and Other Sketches' (1894); 'Appenzell; Pure Democracy and Pastoral Life in Inner Rhoden' (1895); 'Rhode Island: Its Making and Meaning,' a historical work of much importance (1902); 'Rhode Island, a Study in Separatism' (American Commonwealths Series, 1905); 'California Under Spain and Mexico' (1911). Mr. Richman (Litt.D., Brown, 1904) is a member of the Iowa Historical Society, an honorary member of the Rhode Island Historical Society and a corresponding member of the Hispanic Society of America.

RICHMOND, Charles Alexander, American educator and Presbyterian clergyman: b. New York, 7 Jan. 1862. He was graduated at Princeton in 1883 and at the theological seminary there in 1888, being ordained in the Presbyterian ministry in 1888. He held a pastorate at East Aurora, N. Y., in 1888-94, and at Albany, N. Y., in 1894-1909. Since 1909 he has been president of Union College and chancellor of Union University. Author of 'The Four Winds' (1902); 'Safeguards of American Democracy' (1913).

RICHMOND, Charles Lennox, 3d Duke of, English diplomat and statesman: b. London, 22 Feb. 1735; d. Goodwood, Sussex, 29 Dec. 1806. He succeeded to the peerage on the death of his father in 1750, was appointed Ambassador Extraordinary to Paris in 1765 and in 1766 became Secretary of State under the Rockingham administration. He was strongly opposed to the policies which resulted in the American War for Independence, and in 1778 he opened the debate which demanded the withdrawal of troops from America, his opinion being that the position of the colonists was "neither treason nor rebellion, but is perfectly justifiable in every political and moral sense." He also pursued a sympathetic course in regard to Irish affairs, advocating "an union, but not of legislature, but an union of hearts, hands, of affections and interests." He served in Rockingham's second cabinet, and in 1784 joined Pitt's ministry. His views on Parliamentary reform were far in advance of his period, but after his affiliation with Pitt he became a Tory. He was created a Knight of the Garter in 1782.

RICHMOND, Countess of. See **BEAUFORT, MARGARET.**

RICHMOND, Dean, American capitalist: b. Barnard, Vt., 31 March 1804; d. New York, 27 Aug. 1866. He engaged successfully in the refining and selling of salt at 15, was a director in a Syracuse bank before he was of age and afterward engaged as a shipping and produce

merchant at Buffalo. He was a leader in the movement which consolidated seven separate corporations into the New York Central Railroad Company in 1853, was its vice-president in 1853-64 and president in 1864-66. He was a recognized political leader but declined public office.

RICHMOND, Legh, English clergyman: b. Liverpool, 29 Jan. 1772; d. Turvey, Bedfordshire, 8 May 1827. He was graduated from Cambridge in 1794, took orders in the Church of England in 1797 and in 1798 became curate of Brading in the Isle of Wight. In 1805 he was appointed chaplain in the Lock Hospital, London, and later in the same year became rector at Turvey, where he remained until his death. He was well known as a leader in the evangelical party and wrote several tracts which were widely circulated, among them 'The Dairyman's Daughter,' of which more than 4,000,000 copies in 19 different languages were circulated; 'The Negro Servant,' etc. He also published 'The Fathers of the English Church, or a Selection from the Writings of the Reformers and Early Protestant Divines of the Church of England' (8 vols., 1807-12). Consult 'Memoirs,' by Grimshawe (1826; edited by Bedell, 1846).

RICHMOND, Sir William Blake, English painter: b. London, 29 Nov. 1843. He studied in the schools of the Royal Academy, where he received two silver medals in 1857 and had his portrait of his two brothers hung at the exhibition in 1861. He has traveled extensively in Italy, Greece and Egypt, studying the remains of ancient art, whence he has derived many subjects for his work. From 1878 to 1883 he was Slade professor at Oxford. In 1895 he became a Royal Academician, and has been professor of painting at the Royal Academy. His works include 'The Procession of Bacchus' (1865-68); 'The Life of Women' (1870), a series of frescoes for J. S. Hodgson of Haslemere; 'Electra at the Tomb of Agamemnon' (1877); 'Behold the Bridegroom Cometh' (1881); 'Release of Prometheus' (1882); 'Audience at Athens during the Representation of Agamemnon' (1885), now in the Birmingham Gallery. He has painted portraits of Darwin, Gladstone, Browning, William Morris, Holman Hunt and Lord Lyttelton. Most notable of his works are the interior decorations and the glass mosaics of Saint Paul's Cathedral. This work was executed by a staff trained under his personal supervision. He is an earnest advocate of the development of mosaic work in England, believing that this art should be applied only in the country and under the conditions of light in which the finished product is to remain. Consult his article on Mosaics in Vol. XXXI of the New Volumes of the 'Encyclopædia Britannica.'

RICHMOND, Cal., city in Costa County, 10 miles northwest of Oakland and six miles by water northeast of San Francisco, on the west side of San Francisco Bay and on the Atchison, Topeka and Santa Fé and the Southern Pacific railroads. It has a fine natural deep-water frontage six miles long. It is the terminus of the Standard Oil pipe lines and the home port of the company's fleet of vessels, and there is a large oil refinery. Other

industries of the town include porcelain bath-room fittings, brick, pipe and steel works, carbon products, chemicals, furniture and wine. There are also railroad machine shops and yards, and Pullman car shops. The city has grown rapidly. Pop. (1910) 6,802; local estimate (1918) 25,000.

RICHMOND, Canada, the capital of Richmond County, Quebec, 72 miles east of Montreal, on the Saint Francis River, an affluent of the Saint Lawrence, and on the Grand Trunk Railroad. Its chief institution is Saint Francis College, affiliated to McGill University. The town has railway works, machine shops, shoe last factory, sash and door factory and other industrial establishments. There are three banks. The value of all taxable property is estimated at \$1,000,000. The educational establishments include a high school, a Brothers' school and convent. The principal buildings are the town-hall, post office, convent, high school, Roman Catholic church, Methodist church, etc. The government is vested in a mayor and councillors. Pop. about 2,300.

RICHMOND, England, an ancient town in the county and 50 miles northeast of York (North Riding), on the left bank of the Swale. In and around the town are numerous interesting remains of antiquity, the most remarkable of which is the castle, comprising an area of nearly six acres, and one of the most majestic ruins in England; its great tower, about 100 feet high, is a fine and very perfect specimen of the Norman keep. Pop. about 4,000.

RICHMOND, Ind., city, county-seat of Wayne county, on the Whitewater River, and on the Pittsburgh, Cincinnati, Chicago and Saint Louis, the Grand Rapids and Indiana railroads, 68 miles east of Indianapolis and 70 miles northwest of Cincinnati. The Richmond Interurban and the Dayton and Western traction lines connect the city with all nearby places. Richmond was settled and laid out in 1816 by Friends from North Carolina. It was incorporated as a borough in 1834 and chartered as a city in 1840. The city has about 300 manufacturing establishments, employing about 3,500 persons. The chief manufactures are threshers, drills, plows, engines, boilers, carriages, milling machinery, clothing, flour and dairy products. It is the commercial and industrial centre of a large portion of the county. It has a number of fine public buildings, chief of which are the churches and schools. There are 26 churches, 10 public school buildings, two Roman Catholic parish schools and one Lutheran parish school. Other educational institutions are Earlham College (Friends), Saint Mary's Academy (Roman Catholic), one business college and the Morrison-Reeves Free Public Library. The Eastern Indiana Insane Hospital, a State institution, is located here; also other charitable institutions. The government is vested in a mayor and a council of 14 members elected biennially by the people. The metropolitan police board is appointed by the governor. Pop. about 25,000.

RICHMOND, Ky., city, county-seat of Madison County, on the Louisville and Nashville Railroad, about 25 miles south-southeast of Lexington and 135 miles east-southeast of Louisville. It is in an agricultural region; in

the vicinity is found an excellent building stone. The chief manufactures are tobacco and dairy products, and the trade is chiefly in farm and tobacco products, cattle and horses. Its educational institutions are Madison Institute, under the auspices of the Church of the Disciples, Walter's Collegiate Institute, a Presbyterian institution, and public elementary schools. One of the most desperate battles of the Civil War was fought at Richmond. The Confederate forces under E. Kirby Smith defeated a much larger Federal force under Manson and Nelson. Pop. about 5,500.

RICHMOND, Me., town in Sagadahoc County, on the Kennebec River and on the Maine Central Railroad, 37 miles north-northeast of Portland. It was first settled in 1700; in 1719-20 a fort was erected here for the defense of the settlers against the Indians; this fort twice resisted attack, and was finally dismantled in 1754. The town was incorporated in 1823. The chief industries of the town include a cotton mill and shoe factory, ice cutting and agriculture; there are also saw and planing mills and some trade in lumber. The town has a public high school, with which the Richmond Academy (incorporated 1861) was united, and also a public library. Pop. about 2,000.

RICHMOND, Mo., city, county-seat of Ray County, on the Atchison, Topeka and Santa Fé Railroad, 58 miles southeast of Saint Joseph. The county-seat was removed to Richmond from Bluffton in 1827. It is the centre of a fertile agricultural and stock-raising region; and there are coal mines in the vicinity which yield excellent quality of bituminous coal. It also has wagon and plow factories, flour mills and a foundry. It contains the county courthouse and has electric lights and modern water-works. It is well provided with educational facilities, having two public high schools, of which one, the Lincoln High, is for colored pupils; and is also the seat of Woodson Institute, a coeducational secondary school under the auspices of the Methodist Episcopal Church, South. Pop. about 3,700.

RICHMOND, Va., city, port of entry, capital of the State, county-seat of Henrico County, on the James River, the Richmond-Washington Railroad Line, the Atlantic Coast Line, the Chesapeake and Ohio, the Seaboard Air Line and the Southern railroads, about 115 miles almost due south of Washington, D. C., and 90 miles from the mouth of the river at Chesapeake Bay. Area, including the suburbs, 26 square miles. The surface is hilly, rising from the river and the valley of Shockoe Creek in a series of hills, almost terrace-like in formation, until it reaches altitudes of from 170 to 250 feet above sea-level, at which altitudes there are plateaus constituting the principal residential sections. It was originally built on seven hills and was often called the "Modern Rome." In 1842, when Charles Dickens visited the city, it had extended its limits to another hill, and he wrote of it as "delightfully situated on eight hills overhanging James River."

Regular lines of steamers, the Virginia Navigation Company and Old Dominion, connect the city with Atlantic and Chesapeake ports, and furnish a cheap outlet for shipping products to other parts of the United States.

RICHMOND, VA.

1 Washington Monument, near State Capitol

2 Capitol Square, showing the City Hall Building

RICHMOND, VA.

1 The Capitol at Richmond, designed by Thomas Jefferson
2 St. John's Church, Richmond, where Patrick Henry made his famous speech

and to foreign ports. James River (q.v.) furnishes water power which is used extensively for manufacturing and for electrical development which propels the entire street-car system and supplies the electric lights of the city. Several bridges (five railroad and two for vehicles, street cars and foot passengers) cross James river and connect the two sections of the city lying on its opposite banks and afford ready access to its suburbs—Forest Hill Park, Bon Air, Granite, Spring Hill and other places on the south side of the river. The streets are all fairly wide, Main, the chief financial thoroughfare, is a broad, well-built street; Broad, the shopping district, is the widest street in the city; Grace and West Franklin, as well as some of the avenues and suburbs, are residential sections. The water supply, which is excellent for domestic and all other purposes, is obtained from the James River at two points above the city. The water is pumped into two reservoirs from which it is piped for distribution throughout the city. The plant comprises an extensive settling basin and system for insuring its clarification at all times. The natural drainage makes the city healthful, and warm winters and temperate summers attract many home seekers who desire a mild climate.

Industries.—The chief industries of the city are connected with the preparation of tobacco for local use and for shipment to outside markets. Recent statistics give the annual value of cigars, cigarettes, smoking, chewing and reprising tobacco manufactured at \$30,806,680; foundry, machine-shop products and agricultural implements amounted to \$18,850,390; fertilizers, chemicals, cement, etc., to \$10,987,560; flour milling, cornmeal, etc., to \$8,695,750; paper and paper products to \$5,958,150; printing, publishing, etc., to \$5,985,570; boots and shoes to \$5,013,355; other manufacturing establishments produce wagons and carriages, locomotives, ammunition, lumber, saddlery, harness, hides, leather, drugs, medicines, perfumery, etc. The manufacturing concerns number 2,226, employing 32,905 hands. The capital employed is \$37,342,940; the total annual sales amount to \$135,239,212.

Commerce.—The location and the facilities for transportation make Richmond the commercial centre of a large extent of southeastern Virginia, and an important point of distribution for the Carolinas and adjoining Southern States. Richmond has about \$17,150,000 invested in the jobbing trade, with annual sales of \$120,934,665. Post-office receipts amount to more than \$1,000,000 annually (for 1918 they were \$1,290,707); internal revenue receipts to \$20,000,000, and the Custom House collects duty annually of over \$1,000,000 (in 1918, \$10,029,948), although the city's imports and exports are principally cleared through the custom-houses of New York and other northern ports. The amount of trade with the United States Atlantic Coast cities and the cities and towns of the interior of the State is very large.

Banking and Finances.—The city has over 30 banking institutions, including seven national banks. There are also State banks, savings banks, trust companies, private bankers and brokers and loan and deposit companies. Richmond is a national reserve city and the seat

of the Federal Reserve Bank for the Fifth District. The combined resources of the banks exceed \$160,000,000; they have a combined capital and surplus of \$21,302,599; deposits amount to \$102,095,240, and bank clearings for 1918 to \$2,404,367,314. The property valuation of Richmond is \$230,299,969; public assets amount to \$23,613,852. The public debt is \$14,252,095. Building operations have averaged nearly \$5,000,000 during a recent period of five years, and annual real estate sales amount to \$20,712,516. The tax rate is reasonable.

Government.—Richmond is governed by a mayor, council and four directors of departments acting under the mayor; has highly efficient police and fire departments, the latter with partially motorized apparatus and equipment. The municipal assets include waterworks, gas plant, city hall, parks, market houses, school buildings, etc.

Public Buildings, Parks and Monuments.—Richmond is historic ground and her noted public buildings are valued not only on account of their association but also for the architectural merits which they possess. Capitol square, on Shockoe Hill, has an area of 12 acres. It takes its name from the State capitol, which is on the square. The capitol was built after a model procured by Thomas Jefferson when he was in France, and which was patterned after the Maison Carrée of Nîmes, an ancient Roman temple, the columns being changed, however, from the Corinthian to the Ionic. The cornerstone was laid in 1785, and on 19 Oct. 1789, the eighth anniversary of the surrender of Lord Cornwallis at Yorktown, the Virginia State legislature convened in the new capitol. The model for the capitol is still in the building. In the rotunda is the most valuable piece of marble in America, Houdon's statue of Washington, modeled from life. The general assembly of Virginia (1903-04) appropriated \$250,000 for the purpose of adding wings to the east and west sides of this building, for steps to the imposing portico at the southern end and for some interior improvements. These additions are in harmony with the architectural style of the original building and preserve its most characteristic features while they furnish additional room, much needed by the general assembly and the various State departments.

On the same square is the library building, which contains the parole signed by Lord Cornwallis at Yorktown, the original Virginia Bill of Rights, and the Virginia ordinance of secession. The executive mansion is on this square, on land which was once a part of Nathaniel Bacon's plantation. The old building known as the Bell House has many interesting associations. The old bell, purchased in 1790, was for years a "voice to the people."

Among the famous pieces of statuary on the grounds is the equestrian statue of Washington, by Thomas Crawford (q.v.). Of the statues at the base Crawford completed only Thomas Jefferson and Patrick Henry, the other pieces, George Mason, John Marshall, Thomas Nelson and Andrew Lewis, were made by Randolph Rogers. Nearby stands a fine marble statue of Henry Clay, by Joel T. Hart; also several other marble statues and a bronze statue of "Stonewall" Jackson, by Foley. Three fountains add to the beauty of the square.

The William Byrd Park, the largest of the city, has an area of 300 acres. It has two lakes, a fine boulevard and the chief city reservoir. The Joseph Bryan Park—a gift to the city from the family of the late Joseph Bryan—contains 262 acres. Monroe Park has many fine trees and some good pieces of statuary. Libby Park is on Libby Hill. It is terraced from Main street to the summit, and a monument in honor of the Confederate soldiers and sailors stands on the highest point. Chimborazo Hill Park has an area of 36 acres. A government road leads from the park to the National Cemetery, where are buried 6,547 Federal soldiers who fell in the attempts to capture the city during the Civil War. Jefferson Park is between Pleasant and Marshall streets; Gamble's Hill Park is on a relic of the James River and Kanawha Canal, still used as a race to a number of important water-power plants. It also overlooks the famous Tredegar works, where cannon were made, and the no less famous Belle Isle, the site of the Old Dominion Iron and Nail Works, where a number of Federal prisoners were confined during the war between the States. Lee Circle, in the western part of the city, has a bronze equestrian statue of Robert E. Lee (q.v.), by Mercie, a French sculptor. It represents the general on "Traveller," his well-known war horse. In Howitzer Park is a monument in memory of the Richmond-Howitzer battalion. A favorite drive is the one to Hollywood, where sleep 12,000 Confederate soldiers. A monument of granite, pyramidal in form, 90 feet high and softened by a covering of Virginia creeper and ivy, has been erected to the memory of the dead Confederate soldiers. Many of Virginia's famous men are buried here. Tyler and Monroe, Presidents of the United States; John R. Thompson, the poet; Matthew F. Maury, "Pathfinder of the Seas"; John Randolph; Jefferson Davis, President of the Confederacy, and a number of Confederate generals. The most noted parks and squares have a combined area of 358 acres; but the little squares and circles, not mentioned as noted, ornament the city and give it an artistic appearance.

Other historic and prominent landmarks are the residence occupied by General Lee and his family, now the home of the Virginia Historical Society; the house occupied by Jefferson Davis while he was President of the Confederate States; and the famous Monumental Church on Broad street, formerly called Academy square. At one time a large wooden building, built for an academy of fine arts, occupied the present site of the church. In 1788 the old building saw a brilliant gathering of "history makers," who met to discuss the document proposed as the Constitution of the United States of America. Madison, Mason, Marshall, Pendleton, Randolph, Lee, Wythe and others were there, and finally the Constitution as framed at Philadelphia was ratified by Virginia. Only 23 years afterward occurred in the same building at a theatre the terrible disaster which resulted in the death of 72 persons, among whom was the governor of the State. The present church is their monument; the portico extends over their tombs and the charred remains. The house, once the home of Chief Justice Marshall, stands on the street named in his

honor. Saint John's Episcopal Church, built in 1740, is in an excellent state of preservation and is still used for religious services. Richard Randolph, who superintended the building of the church, was a descendant of Pocahontas. In the quaint old churchyard surrounding it is the grave of George Wythe, one of the signers of the Declaration of Independence. In this church, on 20 March 1775, was held the famous Virginia Convention which met to hear a report of the first Continental Congress, and to discuss the political situation of the country. The convention feared to hold a session in Williamsburg, the capital, on account of the hostility of Lord Dunmore. The church was the only place in Richmond large enough for the assembly. It was at this convention that Patrick Henry made his famous speech, ending with the words: "Is life so dear, or peace so sweet, as to be purchased at the price of chains and slavery? Forbid it, Almighty God! I know not what course others may take, but as for me, give me liberty or give me death." The place where the patriotic orator stood is pointed out to strangers. Another interesting event occurred on 6 Jan. 1781, when Benedict Arnold, at the head of a British force of 900, entered the city, and a number of the soldiers were quartered in this old church. The oldest house in Richmond, a stone building on Main street, was built in 1737 by Jacob Ege. It is now used as a historical museum. The Valentine Museum contains over 100,000 archaeological specimens, also many fine pictures and statues. This valuable museum was given to the city by Mann S. Valentine. His brother, Edward V. Valentine, the sculptor, has given to the museum several valuable pieces of statuary. The most costly and the most ornate building in the city of Richmond is the city hall, completed in 1893 at an outlay of over \$1,400,000. It is built of Richmond granite, dressed and quarry-faced, is completely fireproof, and commodious in all its appointments.

Education.—The city has an excellent school system; there are public and parish elementary schools for white and similar ones for colored pupils, a high school, normal school for whites and one for colored, Virginia Mechanics' Institute which has evening classes, kindergartens and a number of private schools. The secondary schools and colleges are the Richmond Female Institute (Baptist), founded in 1854; Richmond Female Seminary (Protestant Episcopal); Hartshorn Memorial College for Colored Girls (Baptist), opened in 1883; Visitation Academy (Roman Catholic), founded in 1860; Saint Peter's Academy (Roman Catholic); Saint Joseph's Academy (Roman Catholic); Saint Patrick's Academy (Roman Catholic); Sacred Heart Academy (Roman Catholic); Saint Mary's Benedictine Institute (Roman Catholic); Training School for Kindergarteners; Art School of Art Club, and Saint Andrew's School, the Medical College of Virginia (1837); Richmond Theological Seminary (Baptist), opened in 1807; Richmond College, opened in 1832; and beyond the city limits, Hartshorn and two others. There are five public libraries with an aggregate of over 60,000 volumes.

Churches.—The city has 130 religious organizations and 90 church edifices; 65 for white people and the others for colored. The dif-

ferent denominations rank according to church edifices and organizations as follows: Baptists, Protestant Episcopalians, Methodists, Presbyterians, Roman Catholics, Lutherans, Jews, Christians, Friends. The Roman Catholic Cathedral, built with means supplied through the munificence of Mr. and Mrs. Thomas F. Ryan of New York, is the finest church edifice in the city.

Charitable Institutions and Hospitals.—There are here Saint Sophia's Home for the Aged, the Sheltering Arms, the Home for Incurables, Foundling Asylum, Retreat for the sick, city orphan asylum, Lee Camp Soldiers' Home and Saint Joseph's Orphan Asylum. There are a number of public and church aid societies and various charitable organizations. Saint Luke's Hospital is one of the best equipped institutions in the city.

History.—In May 1607, John Smith, Captain Newport and others ascended the James River as far as the place where Richmond now stands. In September 1609, Smith, who was the president at Jamestown, again ascended the river to find a better location for the colony than Jamestown. He purchased from the Indians some land near the present site of Richmond, and so pleased was he with the place that he called it "None Such." "Forte Charles" was built below the falls, in 1645. In 1675 and in 1687 a further grant of 950 acres was made, which tracts included the land upon which Richmond now stands, but the city was not founded until some years later by Col. William Evelyn Byrd. He seems to have been versed in methods of founding cities which are now called modern. He established two cities "on paper," one at Sohocco's to be called Richmond, and at the "Point of Appamattuck River," to be called Petersburg. He engaged Major Mayo to lay out the squares, streets, etc. Then he proceeded to advertise his cities, inserting a notice in the *Virginia Gazette*, April 1737, "that on the north side of James River, near the uppermost landing and a little below the falls, is lately built by Major Mayo a town called Richmond, with streets 60 feet wide, in a pleasant and healthy situation, and well supplied with springs of good water." Byrd was a learned man as well as a good advertiser. He brought to the New World a large and well selected library, a catalogue of which is in the Franklin Library in Philadelphia. He proceeded to build a mill, a warehouse, and such other buildings as were necessary. In its early days the place was called Byrd's Warehouse. In 1742 the assembly of Virginia established the town, and the wide streets and squares were at last laid out. In 1779 the capital of the commonwealth was changed from Williamsburg to Richmond. Then the place was only a number of disconnected houses in small groups, with rough ground and rocks intervening. Benedict Arnold entered the city in 1781 and burned a portion of it, as already mentioned. In 1782 Richmond was incorporated as a city, and in 1785 the foundation of the capitol was begun. This capitol, from its opening in 1789 down to the present, has been the scene of many stirring historical events. In 1798-99 took place the famous debates which ended in the adoption of the resolutions, drafted by James Madison, regarding the interpretation of the Federal compact. What powerful conventions were held

here when such men as Monroe, Madison, John Randolph and Marshall were members. The convention of 1851 extended the privilege of suffrage, and here in 1861 the Act of Secession was adopted; and in June of the same year, Richmond was made the capital of the Confederate States. In July 1862, the Congress of the Confederacy convened here and remained in session until April 1865. During the Civil War the city was the great objective point of the chief operations of the Union army in the East. Again and again the Union forces marched to the battle cry "On to Richmond," and again and again were they repulsed. For three years, from May 1862 to April 1865, the city was almost in a constant state of siege; the records tell of 15 pitched battles and 25 skirmishes and sharp engagements which were fought in efforts to capture the city. When its defenders yielded and left the city they set fire to the arsenals and large tobacco warehouses, and burned the bridges directly after crossing them, which caused a most extensive conflagration in the principal business sections. On 27 April 1870, at a contest over the mayoralty before the Supreme Court of Appeals, over 60 persons were killed by the giving away of the floor of the court room. A large number of people were in the building.

The suburbs of Richmond contribute to the charms of the city and to its history pages. The broad, shady avenues of stately, beautiful trees lead out to battle grounds now covered with the houses and business establishments of busy, peaceful people.

The population in 1890 was 81,388 and in 1900, 85,050 but these figures by no means indicated the growth and prosperity of the city. With the exception of the annexation of Lee District, which was just beginning to be built up, the corporate limits had not been extended since 1867, and in many quarters the suburbs were thickly settled and were indistinguishable from the adjacent districts of the city. The population was increased by some 30,000, when the much-needed expansion of the city limits went into effect. This placed it where it properly belonged, in the ranks of cities of over 100,000 inhabitants. Pop. (1910) 127,628; (1919 est.) 160,000; with suburbs 191,000.

Consult Henry, W. W., "Richmond on the James" in "Historic Towns of the Southern States" (New York 1900); Mordecai, S., "Richmond in By-Gone Days" (Richmond 1856; 2d ed., 1860); "Richmond since the War" in *Scribner's Monthly* (New York 1877); Wood, "The Industries of Richmond" (Richmond 1886).

F. D. DUNLOP,
Secretary and Treasurer Richmond Chamber of Commerce.

RICHMOND (Ky.), Battle of, the most decisive Confederate victory of the Civil War. On 14 Aug. 1862, Gen. E. Kirby Smith left Knoxville, Tenn., to unite with General Bragg in northern Kentucky. He passed through Big Creek Gap of the Cumberland Mountains and, leaving General Stevenson's division to observe the Union forces at Cumberland Gap, penetrated Kentucky with about 6,000 men. Preceded by Col. J. S. Scott's cavalry force of 900 men, he moved in the direction of Frankfort, threatening both Louisville and Cincinnati. Gen. Lew

Wallace, with a regiment; hastened from Louisville to Lexington, and there found other forces, over which he was placed in command; new regiments came from north of the Ohio; but as Wallace was about to move forward and oppose Smith he was superseded by General Nelson, who had been ordered by General Buell to take charge of affairs in Kentucky. Upon his arrival Nelson organized the troops at Lexington into a division of three brigades, under Gens. M. D. Manson, Charles Cruft and J. S. Jackson; and hearing that the Confederates were approaching, he sent forward some Kentucky cavalry to oppose them. There were several sharp cavalry affairs, in which the Union cavalry showed such aggression that Kirby Smith determined to make an immediate attack upon the Union forces at Richmond, although his troops were jaded by long and laborious marches, and General Heth's division of 4,000 men was still far to the rear. He had for the attack Cleburne's and Churchill's divisions of 6,000 men and Scott's cavalry brigade of about 850, and the advance was ordered for the morning of 30 August. Scott's cavalry encountered Manson's brigade about half a mile south of Rogersville, and Cleburne, coming up with two brigades, attacked Manson, who, reinforced by a regiment of Cruft's brigade and a battery, endeavored to turn Cleburne's right, but was repulsed. Meanwhile Churchill's division had come to Cleburne's support; a brigade flanked Manson's right and drove it back in disorder; and as the rout became general, another of Cruft's regiments came up, but was quickly repulsed with heavy loss. Another position was taken farther to the rear, where the troops were under partial cover, with artillery on the flanks. This the Confederates soon attacked; Churchill's division struck Cruft's brigade, which was on the right, and drove it back in disorder; and Cleburne advancing in front, Manson's entire line went back, the Confederates in close pursuit. Manson had but partially formed another line in front of Richmond, when General Nelson came on the field and selected a new line near the town and cemetery; and the troops, barely 2,200 in number, had scarcely taken position when the Confederates were upon them in flank and front, fired about three volleys, and the Union troops gave way in utter rout. Early in the day Scott's cavalry had gained the road in rear of Richmond, and the knowledge of the fact increased the demoralization. Nelson, wounded, narrowly escaped to Lexington and thence to Louisville. Manson was wounded and taken prisoner, with over 4,000 of his men, while nine guns, over 6,000 muskets and the entire wagon-train were lost. The fragments of the army made their way to Louisville. The Union troops engaged numbered 6,500 raw men; the Confederates about 6,800 veteran troops. The Union loss was 206 killed, 844 wounded and 4,303 captured or missing, an aggregate of 5,353. The Confederate loss was 78 killed, 372 wounded, and one missing, an aggregate of 461. General Heth, with his division of 4,000 men, joined Smith after the battle, and marched to Lexington, where he arrived 2 September, and the legislature, then in session at Frankfort, fled to Louisville. Heth marched northward to Cynthiana, and to within a few miles of Covington, to threaten Cincinnati, which he found

too well defended to attack, and being in turn threatened, he withdrew to join Smith, who waited at Lexington to join forces with General Bragg, then operating against General Buell. (See PERRYVILLE, BATTLE OF). Consult 'Official Records' (Vol. XVI); Van Horne, 'History of the Army of the Cumberland' (Vol. I); The Century Company's 'Battles and Leaders of the Civil War' (Vol. III).

E. A. CARMAN.

RICHMOND, Borough of. See NEW YORK CITY.

RICHMOND (Va.), Kilpatrick's Expedition to. In February 1864 a cavalry expedition organized to make a dash on Richmond, distribute President Lincoln's amnesty proclamation, and liberate the Union prisoners in the city and on Belle Isle. The expedition was put under command of General Kilpatrick, who, with 4,000 men and a battery of artillery, marched from Stevensburg, crossed the Rapidan at Ely's Ford, early on the night of 28 February, and moved swiftly to Spottsylvania Court House. Here Col. Ulric Dahlgren, with 500 men, was detached from the column, on the morning of the 29th, to cross James River and enter Richmond from the south. Kilpatrick continued his course to the Virginia Central Railroad at Beaver Dam Station, thence to Ground Squirrel Bridge over the South Anna, and to a point five miles from Richmond, which was reached on the morning of 1 March. Believing that his approach was unknown, and that a small force of infantry only occupied the intrenchments, he moved on the Brook road toward the interior line of defensive works, driving in a few pickets, and found infantry and artillery in the works — 500 men and six guns. He opened with artillery, and was about to attack, when he thought he saw reinforcements of infantry filing into the Confederate works, and, feeling certain that Dahlgren had failed, and that his own attack would be a bloody failure, he withdrew to Atlee Station, north of the Chickahominy, and went into camp. Here he was attacked during the night by Wade Hampton's and Bradley T. Johnson's cavalry, the latter having followed him from Beaver Dam Station. The camp of one of his brigades was captured, and Kilpatrick, retreating, was followed down the Peninsula, being joined near Tunstall's Station next day by nearly 300 of Dahlgren's men. He reached Williamsburg on the night of the 2d.

Colonel Dahlgren moved from Spottsylvania Court House across the Virginia Central Railroad, near Frederickshall, to James River, near Goochland Court House, where he expected to cross the river, release the prisoners on Belle Isle, and enter Richmond from the south, to unite with Kilpatrick at 10 A.M. of 1 March. But he could find no ford, so marched by the north bank of the river, approaching Richmond late in the afternoon, and coming upon cavalry and infantry, with which he skirmished sharply until night. Hearing nothing from Kilpatrick, except his guns, heard early in the afternoon, and rightly believing that he had failed, Dahlgren withdrew, designating Captain Mitchell, 2d New York cavalry, to command the rear guard. In the darkness the column became broken, Dahlgren, with less than 100 men going in one direction, and Mitchell in another. Mitchell succeeded in joining Kilpatrick at Tunstall's with

about 260 men. Dahlgren crossed the Pamunkey at Hanover Town, and the Mattaponi at Aylett's Ford, and about midnight 2 March fell into an ambush and was killed. Others were killed and wounded, nearly all were captured. Captain Mitchell reports that of the 500 men of Dahlgren's command 61 were killed and wounded, and 138 captured. The total loss of Kilpatrick's command, including Dahlgren's, was about 350. Consult 'Official Records' (Vol. XXXIII); Humphreys, 'From Gettysburg to the Rapidan'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

RICHMOND (Va.), Sheridan's Raid on the Communications with, a movement which included the battle of Yellow Tavern. At day-break 9 May 1864, General Sheridan, with 10,000 cavalry and six batteries, started from near Todd's Tavern to cut the railroads entering Richmond from the north and northwest. He moved on the Telegraph road; Merritt's division crossed the North Anna at Anderson's Ford at dark and encamped; the rest of the column, harassed by a brigade of Stuart's cavalry, halted for the night on the north side of the river. The march was resumed early on the 10th, several miles of the Virginia Central Railroad destroyed, with rolling-stock and supplies, and at night Sheridan crossed the South Anna, halting at daylight of the 11th on the south bank. Early in the day Davies' brigade encountered Munford's cavalry at Ashland, on the Fredericksburg Railroad, drove it from the place, destroyed the depot and several miles of railroad, and joined Sheridan's main body at Allen's Station. Meanwhile General Fitzhugh Lee's cavalry division had been rapidly marching by a circuitous route to interpose between Sheridan and Richmond, and had reached Yellow Tavern, on the Brook road, six miles from Richmond. Lee had barely 4,500 men. Sheridan's whole force advanced, Merritt's division leading, followed by Wilson's and Gregg's. Merritt attacked and gained the Brook road at Yellow Tavern, but General Stuart, in command of the Confederates, seized a position on his flank and enfiladed his line with artillery. Then Custer's brigade, supported by Wilson's division, charged the flanking force, breaking it and capturing two guns. In this encounter Stuart was mortally wounded. Stuart's detached brigade, under Gen. James B. Gordon, fell upon Sheridan's rear, but Gregg drove it back toward Ashland. Fitzhugh Lee's division retreated toward Richmond. The losses on both sides were severe. Sheridan followed Lee's division and entered the most advanced line of works covering Richmond. Sheridan had intended to keep south of the Chickahominy and march by way of Fair Oaks, to make a demonstration on Richmond. Marching during the night, at daylight of the 12th he massed his force at Meadow Bridge, overlooking the line of the Virginia Central Railroad and the Mechanicsville pike. After demonstrating on the Confederate works, which were found too strong to be attacked, he determined to recross the Chickahominy at Meadow Bridge. The bridge, which had been partially destroyed, was held by some of Gordon's cavalry and a battery on the north side. Merritt's division crossed

after a severe engagement, in which Gen. James B. Gordon, commanding the Confederate cavalry, was killed. Meanwhile, Wilson's division could not pass the second line of the Richmond defenses, on the Mechanicsville road, and was attacked by Barton's and Gracie's infantry brigades and some dismounted cavalry, who, advancing from the works, attacked both Wilson and Gregg, at first with success, driving Wilson in some disorder. After a severe contest the Confederates were driven back to their works, and between 3 and 4 P.M. Wilson and Gregg crossed the Chickahominy above Mechanicsville bridge, and Sheridan encamped his corps near Gaines' Mill. Next day he crossed to the south side of the Chickahominy by Bottom's bridge, marched through White Oak Swamp and, on the 14th, encamped in the vicinity of Haxall's Landing, on James River. He made several demonstrations on the New Market road, in the direction of Richmond, and having drawn supplies from General Butler's army, started on the 17th to rejoin the Army of the Potomac, marching by way of White House, on the Pamunkey. Detachments were sent to destroy the railroad bridges over the South Anna and to demonstrate on Richmond, and 24 May Sheridan rejoined Grant's army near Chesterfield bridge on the North Anna. The Union loss in the movement from 9 May was 64 killed, 337 wounded, and 224 missing. There are no reports of Confederate losses. Consult 'Official Records' (Vol. XXXVI); Humphreys, 'The Virginia Campaign of 1864-65'; Sheridan, 'Personal Memoirs' (Vol. II); McClellan, 'Life and Campaigns of General Stuart'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

RICHMOND (Va.), Union Campaigns Against. As the capital and political centre of the Southern Confederacy, defended by its best army, Richmond became and continued to be the objective point of the Union armies. The first campaign against it was that of General McDowell, which ended in Union defeat at Bull Run, 21 July 1861. (See BULL RUN, FIRST BATTLE OF). The next campaign had its base at Fort Monroe, from which, 4 April 1862, General McClellan advanced with the Army of the Potomac up the York Peninsula. After the siege and capture of Yorktown and the battle of Williamsburg (q.v.), McClellan crossed the Chickahominy, and 30 May his outposts were within five miles of Richmond. Meanwhile, after the destruction, by her commander, of the Confederate ram *Merrimac*, Capt. John Rodgers, with three Union gunboats, ascended James River until he reached Fort Darling (q.v.), on Drewry's Bluff, eight miles below Richmond, where, 15 May, he was stopped by the fire of heavy guns. Commodore Goldsborough, commanding the navy in those waters, now proposed to McClellan to co-operate with him in a joint naval and land attack on Fort Darling, but McClellan declined, preferring to wait until after he should have crossed the Chickahominy. The Confederate authorities were so much impressed with the gravity of the situation, when they heard that the fleet was ascending the river, that the government archives were shipped to Columbia, S. C., and the public funds were kept on cars ready for transportation.

The Confederate defense at Fort Darling was looked upon as the salvation of the Confederate capital. Strong works were now constructed by the Confederates on Drewry's Bluff and on the opposite side of the river, and to the end of the war they barred advance on Richmond by water. Elaborate works were constructed to defend the city from the land side. On 31 May Gen. J. E. Johnston, commanding the Confederate army, advanced from his works around Richmond and attacked McClellan. The battle continued two days, at the end of which the relative positions of the two armies were unchanged. (See **FAR OAKS, BATTLE OF**). On 25 June McClellan, in view of a general advance, threw forward a part of his force toward Richmond, gaining some ground, but Gen. R. E. Lee, commanding the Army of Northern Virginia, assumed the offensive on the 26th by crossing the Chickahominy and attacking McClellan's right, forcing McClellan to retreat to Harrison's Landing, on James River, after a series of hard-fought, bloody battles. (See **PENINSULA CAMPAIGN OF 1862; SEVEN DAYS' BATTLES**). Richmond now had some respite. Lee invaded Maryland, and upon his return defended Richmond on the line of the Rappahannock, from which Burnside in December 1862 and Hooker in April 1863 unsuccessfully endeavored to force him. Lee again assumed the offensive and marched northward for an invasion of Maryland and Pennsylvania, leaving but a small force at Richmond, and Hooker, 10 June, proposed to march immediately upon the city, capture it and then send the disposable part of his force to any threatened point north of the Potomac, but the proposition was negated by General Halleck, and Hooker was informed by President Lincoln that Lee's army and not Richmond was his true objective. On 14 June Halleck ordered General Dix, commanding at Fort Monroe, to send an expedition to threaten Richmond and destroy the railroad bridges over the South and North Anna rivers. Dix drew troops from Suffolk and Norfolk, and on the 24th Colonel Spear, with about 1,200 men of the 11th Pennsylvania, 2d Massachusetts and 12th Illinois cavalry, was sent by water up York River, landed at White House on the 25th, marched through Hanover Court House and on the 26th attacked and captured about 100 men of the 44th North Carolina at the bridge of the Virginia Central Railroad over the South Anna, burned the bridge and returned to White House on the morning of the 27th. Upon Spear's return Dix organized an expedition of 10,000 men, under General Getty, to destroy the bridge of the Fredericksburg and Richmond Railroad over the South Anna, and an expedition of 6,000 men and 14 guns, under General Keyes, to threaten Richmond by seizing Bottom's Bridge over the Chickahominy. Both expeditions moved from White House on 1 July. Keyes failed to accomplish anything, being held in check by a small force under Gen. D. H. Hill. Getty, preceded by Spear's cavalry, marched from White House to Hanover Court House, which he occupied on the 4th, his advance reaching the bridge over the South Anna late in the day and making an attack, which was repulsed by Gen. John R. Cooke, who had about 4,000 men. General Foster, who was in com-

mand of Getty's advance, destroyed some of the railroad track, and during the night was recalled to Hanover Court House. The depot and track at Ashland Station was destroyed, and on the 5th Getty took up the return march to White House, which was reached on the 7th, his loss being 16 killed, wounded and missing. Dix returned to Fort Monroe and sent part of his command to the Army of the Potomac.

After the Gettysburg campaign (see **GETTYSBURG, CAMPAIGN AND BATTLE OF**), General Lee fell back beyond the upper Rappahannock and General Meade followed. Meade was forced back to Centreville, and, renewing the offensive, pushed Lee beyond the Rappahannock and then beyond the Rapidan. Meade now essayed an advance on Richmond by passing Lee's right, but was checked at Mine Run (q.v.), 28-29 Nov. 1863.

On the morning of 6 Feb. 1864 Gen. I. I. Wistar, with 2,200 cavalry and 4,000 infantry, left Williamsburg to make a dash on Richmond and release the Union prisoners there. The cavalry advance arrived at Bottom's Bridge, on the Chickahominy, about 13 miles from Richmond, before daylight of the 7th, and found the Confederates in force under Gen. Eppa Hunton, and reinforcements coming up by railroad from Richmond. A deserter from the Union army had given information of the proposed movement, troops had been sent from Richmond, Bottom's Bridge taken up and the fords obstructed. The cavalry charged one of the fords and was repulsed by canister fire with some loss, and Wistar desisted from further effort and returned to Williamsburg. To cover this movement and divert Lee's attention from it, the cavalry and two corps of the Army of the Potomac made a demonstration on the 6th upon Lee's army at Morton's Ford, the demonstration continuing on the 7th with considerable loss. Later in the month General Kilpatrick made a movement on Richmond which resulted in a lamentable failure. See **RICHMOND, KILPATRICK'S EXPEDITION TO**.

The next and final campaign against Richmond was conducted by General Grant, beginning in May 1864. With the Army of the Potomac he advanced from the north, while General Butler, with the Army of the James, crossed to the south side of James River and marched up its right bank. Butler was defeated at Drewry's Bluff (q.v.), 16 May and confined to his intrenchments at Bermuda Hundred (q.v.). The Army of the Potomac began the campaign by the battle of the Wilderness (q.v.), 5-7 May, and on the 9th General Sheridan set out on his raid, elsewhere described. (See **RICHMOND, SHERIDAN'S RAID ON**, and the **BATTLE OF YELLOW TAVERN**). Grant continued his campaign in a series of sanguinary battles, and after the bloody repulse of Cold Harbor (q.v.) he abandoned the campaign north of the James, crossed to the south side of the river 14-16 June and invested Petersburg and Richmond from that side. (See **PETERSBURG, MILITARY OPERATIONS AGAINST**). The siege began on 19 June 1864 and continued until 2 April 1865, when Petersburg was assaulted and taken, and that night Richmond was evacuated, the Union troops under General Weitzel occupying it 3 April. *See also* **RICHMOND, UNION CAMPAIGNS AGAINST**. E. A. CARMAN.

RICHMOND COLLEGE, located at Richmond, Va. It was founded in 1832 by the Baptists under the name of the Virginia Baptist Seminary; the name was changed to Richmond College in 1840. The college was closed during the Civil War; the buildings were used as a hospital by the Confederates and as barracks by the Federals after their occupation of Richmond. The equipment was largely destroyed and much of the endowment rendered worthless, but the college was reopened in 1866, a new endowment was obtained, and it has since then been prosperous and has taken a leading part in Southern educational life. Courses are elected in accordance with the group system, there being three groups. The degrees of A.B. and B.S. are conferred; and A.M. for graduate work. There is also a School of Law, which confers the degree of B.L. Women were admitted to the college in 1898. In 1914 Westhampton College, an institution for women, was opened. The two colleges have the same president, the same board of trustees and the same male faculty. They are, however, simply co-ordinate institutions and cannot be called coeducational. The total annual attendance of students of both colleges is over 400; the faculty numbers 43. The value of the buildings and grounds is about \$1,250,000 and the income about \$110,000.

RICHTER, rih'tér, Adrian Ludwig, German painter and designer: b. Dresden, 28 Sept. 1803; d. near there, 19 June 1884. His father, Karl August Richter, the well-known copper-plate engraver, was his first teacher, as he was his father's collaborator in the production of landscapes in black and white. In 1820 he accompanied Prince Narischkin in a journey through France as draughtsman to illustrate that nobleman's travels; subsequently he spent three years, ending 1826, in Italy. He next applied himself to study the masters of the North Holland School, and chose J. Schnorr as his especial model and standard of excellence. Returning to Germany he was appointed in 1828 to a position in the School of Design at Meissen, which he held for 10 years, meanwhile acquiring a popular reputation as illustrator of 'The Vicar of Wakefield' and 'Popular Books of Germany.' He inaugurated an epoch in German illustrative art by his sympathetic interpretation of common life in Germany, his tender humor and refined fancy. While he drew on wood for book illustration, he also executed numerous etchings, mostly of Italian landscapes. The most important of his landscapes in oil, which, however, are marred by a certain coldness of treatment, are 'Storm on Mount Gerone' (1830, in the Museum, Frankfurt-on-Main); 'Harvest Time on the Roman Campagna' (1833, Leipzig Museum); 'Schrecken-stein near Aussig'; 'Landscape in the Riesen Mountains,' etc. After working for some years as professor of landscape painting in the Dresden Academy, he retired in 1876 on a pension provided by the German emperor. Consult his autobiography, 'Lebenserinnerung eines deutschen Malers' (1855); Hoff, 'Adrian Ludwig Richter, Maler und Radierer' (1877).

RICHTER, Gustav, German painter: b. Berlin, 31 Aug. 1823; d. there, 3 April 1884. He studied under Eduard Holbein in Berlin and Cogniet at Paris, and also at Rome. He

was professor of the Berlin Academy and honorary member of the academies of Munich and Vienna. His first work to attract attention was the 'Raising of Jairus' Daughter' (1856). In 1864 he received the Grand Medal at Berlin; other medals have been conferred on him at Paris, Brussels, Vienna and Philadelphia. His works are reproduced in vivid colored chromos. He painted many European celebrities, and of Americans a notable portrait of George Bancroft, the historian.

RICHTER, Hans, Austrian musical conductor: b. Raab, Hungary, 7 Aug. 1843. He was the son of the capellmeister of the cathedral and entered the conservatorium at Vienna in 1860. He studied the horn under Kleinecke, the violin under Heissler and theory under Sechter. He was conductor of the Hofund National Theatre, Munich, in 1868-69, after which he visited Paris and Brussels. He became chief conductor of the National Theatre, Pesth, in 1871; and in 1875 succeeded Dessoff as conductor of the Court opera at Vienna, holding at the same time the conductorship of the Philharmonic Concerts. He became Court capellmeister in 1878; and in 1879 he inaugurated in London the Orchestral Festival Concerts, later known as the Richter Concerts and continued successfully for many years. He became conductor of the Manchester orchestra in 1897; and from 1885 until his return to Vienna in 1911 he conducted the Birmingham Festival. He is regarded as one of the greatest living conductors.

RICHTER, Henry Joseph, American Roman Catholic bishop: b. Neunkirchen, Oldenburg, Germany, 9 April 1838; d. 26 Dec. 1916. He came to the United States in 1854, studied at Saint Xavier's College, New York, at Mount Saint Mary's Seminary, Cincinnati and in 1860 entered the American College at Rome, where he was graduated in 1865. He was ordained in that year, was vice-president and professor of dogma, philosophy and literature at Mount Saint Mary's Seminary, Cincinnati, in 1865-70 and in 1870-83 was rector at Saint Lawrence and chaplain of Mount Saint Vincent Academy. In 1883 he was consecrated first bishop of Grand Rapids.

RICHTER, Johann Paul Friedrich, generally known as JEAN PAUL, German author: b. Wunsiedel, near Baireuth, Bavaria, 21 March 1763; d. Baireuth, 14 Nov. 1825. He was educated at Leipzig and became a tutor and schoolmaster. In 1794 he turned from teaching to a general literary activity. The prince-primate Dalberg gave him in 1809 an annual pension of 1,000 florins, continued by the king of Bavaria. The fantastic quality of his genius was at first disconcerting but gradually, says Carlyle, he became considered 'not a strange crack-brained mixture of enthusiast and buffoon, but a man of infinite humor, sensibility, force and penetration.' His style is perhaps one of the most barbarous and his books are quite without structure. His humor, however, is genuine, though frequently clumsy. He affected boldly to despise all literary proportion and technique and is recompensed by having the bulk of his work pronounced difficult or unreadable. Yet scattered through his writings are the best of aphorisms and some of the most finely imagined passages in German literature. These may

serve to account for the interest Carlyle and De Quincy took in him. Outside of Germany he has not been greatly read, though there are various English renderings of his volumes, such as 'Walt and Vult' by Lee (1846); 'Titan' by Brooks (1863); 'Flower, Fruit and Thorn Pieces' by Ewing (1877); and 'Levana' by Wood (1887). His first novel, 'Die unsichtbare Loge' ('The Invisible Lodge') appeared in 1793. It was followed by 'Hesperus' (1794); 'Biographische Belustigungen unter der Gehirnschale einer Riesin' ('Biographical Recreations under the Skull of a Giantess', 1796); 'Leben des Quintus Fixlein' (1796); 'Blumen, Frucht und Dornenstücke' ('Flower, Fruit and Thorn Pieces', 1796); 'Der Jubel-senior' ('Parson in Jubilee', 1797); 'Das Kampaner Thal' (1797); 'Titan' (1800); 'Flegel-jahre' (translated by Carlyle, 'Wild Oats', 1804). The two last are regarded as among his best productions. 'Das heimliche Klaglied der jetzigen Männer' appeared in 1801; 'Dr. Katzenberger's Badereise' (1809); 'Des Feldpredigers Schmelzle Reise nach Flätz' (1809); 'Leben Fibels' (1812); 'Der Komet, oder Nicolaus Markgraf' (1820-22); 'Die Vorschule der Aesthetik,' his first important philosophical work, appeared in 1804, followed by 'Levana, oder Erziehungslehre' (1807), a work on education. Further titles are 'Friedenspredigt' (1808); 'Dämmerungen für Deutschland' (1809); 'Mars und Phöbus' Thronwechsel im Jahr 1814' (1814); 'Politische Fastenpredigten' (1817). A collection of his works, 'Sämmtliche Werke,' edited by him before his death, was published in 65 volumes (1826-38). 'Der Papierdrache,' his last work, was published in 1845. Consult Spazier, R. O., 'Jean Paul Friedrich Richter, ein biographisches Commentar zu dessen Werken' (1833); Carlyle's two essays on Richter; Förster, 'Denkwürdigkeiten aus dem Leben Richters' (1863); and Nerrlich, P., 'Jean Paul und seine Zeitgenossen' (1889).

RICHTHOFEN, rī'h'hōf-ën, Ferdinand, BARON VON, German geologist: b. Karlsruhe, 5 May 1833; d. Berlin, 7 Oct. 1905. He was educated at the universities of Breslau and Berlin; and went to Austria in 1856 to study the geology of Tyrol, Siebenbürgen and northern Hungary. In 1860 he joined a Prussian expedition to the East and spent 12 years in China, Japan, Siam, Java, the Philippine Islands, Formosa, California and Nevada. Returning to Europe in 1872, he accepted professorships at Bonn, Leipzig and Berlin, successively. He published 'China, Ergebnisse eigener Reisen und darauf gegründeter Studien' (1877-83), and the following have appeared in English: 'The Comstock Lode' (1865); 'Principles of the Natural System of Volcanic Rocks' (1867); 'Letters to the Shanghai Chamber of Commerce' (1869-72).

RICHWOOD, Ohio, village in Union County, on the Erie Railroad, 34 miles northwest of Columbus. It was settled in 1832 and its growth during the first 30 years was slow; since 1870 it has become the second town of the county in size and importance. It is the centre of an agricultural region; contains flour and planing mills, tile mills, poultry packing houses and several large grain elevators and has a considerable trade. It has a public high-school with a school library and grade schools, a normal school, city building, etc. The three banks

have combined resources of \$1,300,000. The value of taxable property is estimated at \$2,000,000. The yearly receipts average \$23,500. There are four miles of paved streets. Pop. 1,850.

RICHWOOD, W. Va., town in Nicholas County, on the Cherry River, 60 miles southeast of Charleston, on the Baltimore and Ohio Railroad. It is situated in a coal and timber region and has paper mills and a tannery. Pop. 3,060.

RICIMER, ris'i-mër, Roman general of the 5th century A.D.; d. 472. He was a barbarian, but his youth was passed at the Court of Valentinian III, and he received his training under Aëtius. For a long time he was 'kingmaker' in the West. He deposed Avitus, and elevated successively Flavius Anitus (454-56), Majorianus (457-61), Libius Severus (461). After Libius' death, he himself ruled for a time as Patricius, until in 467 the danger of a Vandal invasion compelled an alliance of East and West, and the elevation of Procopius Anthemius. Ricimer later grew openly hostile to the monarch, whom he murdered 11 July 472 during a sack of Rome. He then made Olybrius emperor, and died soon afterward.

RICKARDITE. A purple copper telluride Cu₂Te, found in Good Hope mine, Gunnison County, Colo.

RICKARDS, rik'ardz, Marcus Samuel Cam, English poet and naturalist: b. Exeter, 28 April 1840. He was educated at Oxford, admitted a solicitor in 1862, and practised for many years in Bristol. In 1876 he took priest's orders in the English Church, was curate of Holy Trinity at Clifton, near Bristol, till 1889, and was then vicar of Twigworth, Gloucestershire, till 1913. Among his many published works, mainly in verse, are 'Creation's Hope' (1890); 'Poems of Life and Death' (1895); 'Poems of a Naturalist' (1896); 'Musings and Melodies' (1902); 'Poems, Old and New' (1905); 'Echoes of the Infinite' (1909); 'A Soul's Symphony' (1913); 'Echoes from the Epistles' (1915), etc.

RICKETS, a disease of children in which there is an affection of the general nutrition of the whole body, dependent chiefly upon improper feeding and want of fresh air and exercise. The disease commonly appears after the age of nine months and before that of two years, producing its most obvious effects on the growth of the bones. It is characterized by enlargement of the head, prominent forehead, projecting breast-bone, flattened ribs, big belly and emaciated limbs, with great debility. The bones and spine of the back are variously distorted. Nature frequently restores the general health, and leaves the limbs in a state of distortion. In the treatment of rickets tonic medicines, the cold bath, etc., are beneficial. The child should be kept clean and dry, regularly exercised, and allowed to enjoy a pure bracing air, that of the seaside being specially beneficial. The food should be nutritious and easily digestible.

RICKETTS, rik'ëts, James Brewerton, American military officer: b. New York, 21 June 1817; d. Washington, D. C., 22 Sept. 1887. He was graduated from West Point in 1839, served in the Mexican War, where he was engaged at Monterey and at Buena Vista, was

promoted captain in 1853, and fought in the Seminole War in Florida. He afterward served on the Texas frontier until the outbreak of the Civil War, when he assisted in the defense of Washington and the capture of Alexandria. He participated in the first battle of Bull Run where he was made prisoner but on his release in 1862, he was brevetted brigadier-general of volunteers. He commanded a division at Chantilly, South Mountain and Antietam, in 1863 received promotion as major of artillery in the regular army, was in command of a division in the Richmond campaign, and fought in the engagements from the battles of the Wilderness to the investment of Petersburg. In 1864 he served under Sheridan in the pursuit of Early's army. He was brevetted major-general in the regular army in 1865, and in 1865-66 was in command of a district in Virginia. He was mustered out of the volunteer service in 1866, and in 1867 retired from active duty.

RICKETTS, Palmer Chamberlaine, American engineer and educator: b. Elktion, Md., 17 Jan. 1856. He was graduated at the Rensselaer Polytechnic Institute in 1875 and was appointed to the teaching staff there, becoming professor of technical mathematics in 1884, and president and director in 1901. He is known as a consulting engineer for railroads and corporations; and is vice-president of the American Society of Civil Engineers. Author of 'History of Rensselaer Polytechnic Institute' (1895), and of papers for technical journals.

RICKMAN, rik'man, Thomas, English architect: b. Maidenhead, Berkshire, 1776; d. March 1841. He developed a taste for architectural drawing, and having sent in a design for a church that proved successful in a government competition, he settled at Birmingham as an architect. He built a number of Gothic churches and chapels in Birmingham, Hampton, Lucy, Bristol, Preston, Carlisle, etc., many country houses, and the new buildings of Saint John's College, Cambridge. He is the author of 'Attempt to Discriminate the Styles of Architecture in England from the Conquest to the Reformation' (1817).

RICO, re'kō, Martin, Spanish painter: b. Madrid, about 1850; d. 1908. He studied under Frederico de Madrazo, and later in Paris and Rome. He was elected a member of the Legion of Honor in 1878. His works are well known in America where he is represented in many collections, both public and private, and present architectural subjects chiefly. Among his works are 'Doge's Palace in Venice' (Samuel Hawk Collection, New York); 'Italian Garden' (Metropolitan Museum); 'Court Interior-Granada' and 'On the Seine' (Morris K. Jessup Collection, New York); 'Canal Near Poissy' (A. J. Drexel, Philadelphia); 'Entrance to Canale Grande, Venice'; 'Bridge of Toledo'; 'Gathering Oranges, Toledo' (Walters' Gallery, Baltimore); 'Banks of the Adige' (Corcoran Gallery, Washington), etc.

RICO, Colo., town and county-seat of Dolores County, on the Rio Grande Southern Railroad, 140 miles southwest of Leadville and on Dolores River. The first settlement was made in 1867 and a new settlement in 1877, both by mining prospectors; the town was incorporated in 1879, and became the county-seat on the

organization of the county in 1881. It is in a region rich in gold, silver, copper and iron, and the chief industry is the mining and milling of these ores. The town contains a bank, a hose-house and the county courthouse. It has a graded public school. The government is vested in a mayor, elected annually, and a council of six members, three elected each year. Pop. 500.

RICORD, rik'ord, or **RICARD**, John, American lawyer: prominent in Hawaiian affairs in 1843-47. He is stated by some authorities to have gone to Hawaii from Oregon while others speak of him as a young lawyer who arrived from New York. He reached Hawaii in October 1843, was appointed attorney-general in 1844, and in 1845, by request of the legislature, he prepared three bills which were practically amendments to the constitution, providing for the establishment and defining of the duties of an executive department of the government and also for a judiciary independent of the executive branch of the government. Regular cabinet departments were established, the Premier being Minister of the Interior, while other departments were foreign affairs, finance, public instruction and attorney-general. As far as was practicable Ricord sought to establish the common law of England in the islands, and the statute laws drafted by him and passed by the legislature remain in a large measure still in force. He left the islands in 1847.

RICORD, re'kōr, Philippe, French physician: b. Baltimore, Md., 10 Dec. 1800; d. Paris, France, 22 Oct. 1869. He went to Paris in 1820, where he was granted his medical degree in 1826, practised in the provinces for two years, and on his return to Paris passed the Concours examination, and was appointed a surgeon at the Pitié Hospital. In 1831 his lectures in surgery secured his appointment as surgeon-in-chief at Hôpital des Veneriens du Midi, an office he continued to fill until 1860, when he resigned and engaged in private practice. In 1862 he was appointed physician in ordinary to Prince Napoleon, and in 1869 consulting surgeon to Napoleon III. He was made commander of the Legion of Honor in 1860, and for his services in the ambulance corps during the siege of Paris was made grand-officer of the Legion in 1871. He was the author of various valuable surgical treatises and invented several surgical instruments.

RIDDLE, Albert Gallatin, American lawyer and author: b. Monson, Mass., 18 May 1816; d. Washington, D. C., 15 May 1902. He removed with his father, to Geauga County, Iowa, in 1817, studied law, and was admitted to the bar in 1840. He was elected to the legislature in 1848 and in that year called the first Free-Soil Convention in Ohio. He removed to Cleveland in 1850, was elected prosecuting attorney in 1856 and in 1859 he defended the Oberlin slave rescuers. He served in Congress in 1861-63 and was then appointed United States consul at Matanzas. From 1864 he was engaged in law practice at Washington, D. C. He was one of the lawyers retained by the government for the prosecution of John H. Surratt for the murder of President Lincoln. He served as law-officer of the District of

Columbia from 1877; and for several years after its establishment he was in charge of the law department at Howard University. Author of 'Students and Lawyers' (1873); 'Alice Brand: A Tale of the Capital' (1875); 'Life of James A. Garfield' (1880); 'The Sugar Maple of the West Woods' (1885); 'Life of Benjamin Wade' (1886); 'Recollections of War Times, 1860-65.'

RIDDLE, *rid'el*, Matthew Brown, American theologian: b. Pittsburgh, Pa., 17 Oct. 1836; d. 1 Sept. 1916. He was graduated from Jefferson College, Pennsylvania, in 1852, and from the New Brunswick Theological Seminary in 1859. He was adjunct professor of Greek at Jefferson College in 1857-58, was pastor of the Dutch Reformed Church, Hoboken, N. J., 1861-65, and of the Second Reformed Church, Newark, N. J., 1865-69. In 1871-87 he occupied the chair of New Testament exegesis at Hartford Theological Seminary, Conn., and from 1887 filled that chair at the Western Theological Seminary, Allegheny, Pa., until he retired in 1913. He was a member of the American Committee for New Testament revision, an editor of the Standard edition of the Revised Version, and was a revising editor on the Standard American Revised Version of the New Testament (1901). He was one of the editors of Lange's 'Commentary'; 'International Commentary'; 'International Revision Commentary'; and Myer's 'Commentary'; edited Robinson's 'Greek Harmony of the Gospels' (1885); Vols. VII, VIII, 'Ante-Nicene Fathers'; and Vols. VI, X, 'Nicene and Post-Nicene Fathers' (1886).

RIDDLE, any sentence or composition with an intentionally double or veiled meaning, which is propounded for another to discover the meaning. A riddle may either have an apparent sense which serves as a disguise to the real one, or it may be in the form of a question, the terms of which do not directly indicate the nature of the answer required. Riddles naturally divide themselves into two classes: plays upon words, which are otherwise called conundrums; and allegorical or fanciful descriptions of or allusions to the subject on which the riddle is founded. The latter is called an enigma. It is the more ancient and serious form of the riddle. Enigmas, or dark sayings, were frequently used by the ancients to disguise important truths, which it was not deemed safe or advisable that everyone should know. Kings sent enigmas to each other, ambassadors delivered their messages in this form, and the oracles of the gods were frequently conveyed in the form of an enigma. In modern times serious enigmas have been elaborated in prose and verse, particularly the latter, in all civilized languages. They are in general mere elaborate trifling, and are commonly as dull as they deserve to be.

Among the most celebrated examples of ancient riddles is that propounded by the Sphinx, and answered by Oedipus, What animal is that which goes on four feet in the morning, on two at midday, and on three in the evening? The answer is Man, because he goes on all fours as a child, on two feet as a young man, and with a staff in old age. The punning variety of riddle, though sometimes indulged in by the Greeks and Romans, is of comparatively modern

growth. It is a great favorite in festive gatherings of juveniles. Sometimes strings of puns are linked together with considerable ingenuity in the more complex riddles of this description, as in the following instance. What wind does a hungry sailor like best? One that blows fowl and chops, and then comes in little puffs. The earliest collection of riddles known to have been published is entitled 'Demands Joyous,' printed in 1511. The first French collection was published in Paris by Gille Beys in 1582.

RIDEAU-OTTAWA CANAL SYSTEM. See CANADIAN CANALS.

RIDEING, *rid'ing*, William Henry, American editor: b. Liverpool, England, 17 Feb. 1853. He came to the United States and lived in Chicago until 1870, after which he was engaged in journalism in various American cities. Since 1882 he has been associate editor of the *Youth's Companion*, and in 1887-99 was associate and managing editor of the *North American Review*. He has published 'Scenery of Pacific Railways' (1878); 'Thackeray's London' (1885); 'In the Land of Lorna Doone' (1895); 'At Hawarden with Mr. Gladstone' (1896); 'How Tyson Came Home' (1904), and 'Many Celebrities,' a book of reminiscences of a very varied life, 1912.

RIDERS, in national or state legislation, the additional provisions of a bill under the consideration of a legislative assembly, having little connection with the subject matter of the bill. Sometimes riders are attached to important and particularly to appropriation bills, in order to obtain their passage, as by themselves they would be likely to incur an executive veto, while as a part or proviso of an important bill they are absorbed in the main subject, and so avoid the "veto" and the "table." It has been proposed frequently that the Constitution of the United States be so amended that the President could veto single objectionable items without affecting the main purpose of bills.

RIDERS TO THE SEA, by John Millington Synge, is the most nearly perfect tragedy in one act in modern literature. The very simple plot is based not on the traditional conflict of human wills but on the hopeless struggle of man against the impersonal but relentless cruelty of the sea. It has taken from Maurya four of her six sons, their father, and their father's father. The fifth son is missing and her daughters get proof that he too has been drowned while Maurya is entreating Bartley, the last of them all, not to ride his horses down to the boat for the Connemara fair. "If it was a hundred horses, or a thousand horses you had itself, what is the price of a thousand horses against a son, where there is one son only?" But Bartley will not listen, and when the sea swallows him too, the tragedy of the mother's previous revolt pales before the utter tragedy of her resignation. "They're all gone now and there isn't anything more the sea can do to me. . . . I won't care what way the sea is when the other women are keening." In all of Synge's plays except 'Deirdre of the Sorrows,' one can trace his inspiration to his stay in the Aran Islands,—usually to a story he has heard on the road or by the turf fire—but in 'Riders to the Sea' we have the most direct transcript of his own sympathetic knowledge of the peo-

ple and conditions of those wind-swept, sea-swept isles where life seems only the sweeter for being purchased by daily struggle with barren soil and warring elements. In this struggle it is inevitably the mothers who lose out. "The maternal feeling is so strong in these islands," Synge writes, "that it gives a life of torment to the women." The contrast between 'Riders to the Sea' and 'The Playboy of the Western World' indicates the gamut of Synge's genius. The former is as remarkable for the exquisite consistency of its theme, treatment and atmosphere as the latter is for its variety and its piquant contradictions; the one almost defies criticism, the other challenges it. 'Riders to the Sea' was first produced by the Irish National Theatre Society at Molesworth Hall in Dublin on 25 Feb. 1904. It was in the repertory of the Irish Players on tour in the United States in 1912-13. Consult Synge, J. M., 'The Aran Islands'; id., prefaces to 'The Playboy of the Western World' and 'The Tinker's Wedding'; Bickley, Francis, 'John Millington Synge'; Boyd, Ernest, 'Contemporary Drama in Ireland'; Howe, P. P., 'John Millington Synge'; Weygandt, Cornelius, 'Irish Plays and Playwrights.'

RIDGAWAY, rĭj'ā-wā, Henry Bascom, American Methodist Episcopal clergyman and educator: b. Talbot County, Md., 7 Sept. 1830; d. Evanston, Ill., 3 March 1895. He was educated at Dickinson College, engaged for several years as a pastor, and in 1882 was appointed professor of historical theology at Garrett Biblical Institute. In 1884 he became professor of practical theology there, a position he held until his death, serving also as president of the institute. Author of 'Life of Alfred Cookman' (1871); 'The Lord's Land; Travels in Sinai and Palestine in 1873-74' (1876); 'Life of Bishop Edward S. James' (1882); 'Bishop Matthew Simpson' (1885), etc.

RIDGE, rĭdʒ, John, Cherokee Indian leader: b. northern Georgia, about 1801; d. 22 June 1839. His early education was begun in the schools conducted among the Cherokee people by the Moravian missionaries. In 1818, at the instance of the American Board of Commissioners for Foreign Missions, he was selected with two other Cherokee youths to attend school at Cornwall, Conn. While there, he became acquainted with Miss Sarah B. Northrop, a member of a prominent local family, whom he afterward married. With his father (Major Ridge) and his cousin (Elias Boudinot) he took an active part in the agitation for the removal of the Cherokee people to the West and was one of the signers of the treaty of New Echota, under which it was finally accomplished. In revenge for this radical action, his death was plotted with that of other members of the Treaty party, by some of the ultra conservative full-blood members of the faction which was opposed to removal. He was a talented man, of strong personality and winning address. So pronounced was his persuasive eloquence that those who plotted his death especially charged his assassins to permit no words of parley with him lest he dissuade them from their fell purpose. He was stabbed to death at his home.

RIDGE, Major, Cherokee chief: b. Highwassee, present State of Georgia, about 1771; d.

Cherokee reservation, 22 June 1839. He became a councilor and one of the leaders of the Cherokee nation. He favored the deportation of the Cherokees from the Georgia reservation to one westward of the Mississippi, and was murdered, presumably, by some of the opposing party.

RIDGE, William Pett, English novelist: b. 1860, Chatham, Kent. He was educated at the Birbeck Institute in London. He began to write in 1890, and among his published works are 'The Second Opportunity of Mr. Staplehurst' (1896); 'A Breaker of Laws' (1900); 'Outside the Radius' (1900); 'Lost Property' (1902); 'Mrs. Galer's Business' (1905); 'Splendid Brother' (1909); 'The Happy Recruit' (1914); 'The Kennedy People' (1915). He is best known for stories of a humorous character.

RIDGEFIELD, rĭdʒ'fĕld, Conn., town in Fairfield County, on the New York, New Haven and Hartford Railroad, about 60 miles northwest of New York, and 13 miles north by west of Norwalk. It is in an agricultural region, and is a favorite summer resort for residents of New York. The chief industries which contribute to the prosperity of the town are farming, dairying, the grinding of feldspar, and the manufacturing of ice-cutting tools. The most prominent public building is the public library, presented to the town by James Morris of New York, in memory of his wife, Elizabeth W. Morris. There are four churches, good public schools, and one private school. The government is administered by a board consisting of a warden and burgesses, six members, elected annually in May. Pop. about 3,200.

RIDGETOWN, Canada, town in the County of Elgin, province of Ontario, on the Michigan Central Railroad, about eight miles from Lake Erie and 65 miles east of Windsor. It is in an agricultural region, and has some manufacturing interests.

RIDGEVILLE, rĭdʒ'vĭl, Ind., town in Randolph County, on the Mississinewa River, and on the Pittsburgh, Cincinnati, Chicago and Saint Louis and the Grand Rapids and Indiana railroads, about 60 miles south of Fort Wayne and 90 miles northeast of Indianapolis. It is in a fertile agricultural region and is the trade centre for the northern part of the county. It has several industries connected chiefly with farm products and stock raising. It has good public schools, several private schools and a public library. Pop. about 1,300.

RIDGEWAY, William, British archaeologist: b. King's County, Ireland, 1853. He was educated at Trinity College, Dublin, and at Cambridge University. He was appointed professor of Greek at Queen's College, Cork, in 1883; and from 1892 was professor of archaeology at Cambridge. He was Gifford lecturer in natural religion at Aberdeen in 1909-11; Stokes lecturer on Irish archaeology at Dublin in 1909; Hermione lecturer in art at Dublin, 1911; and president of the Royal Anthropological Institute in 1908-10. He has also been Brereton Reader in classics at Cambridge since 1907 and is a Fellow of Caius College. Author of 'Origin of Metallic Currency and Weight Standards' (1892); 'Homeric Land System' (1907); 'The Origin of Tragedy' (1910);

'Minos the Destroyer' (1910); 'The Dramas and Dramatic Dances of non-European Races' (1915).

RIDGEWOOD, N. J., village in Bergen County, on the Erie Railroad, about 21 miles north of New York. The railroad divides the village into eastern and western sections. The village is in a residential locality; the western side is built up with fine residences, most of them the homes of men doing business in New York City. The eastern section of the village spreads out into the Paramus Valley, through which flows the Saddle River. In this part are substantial dwellings with extensive grounds. There are no manufactories. The business blocks and fraternal society buildings are mostly of limestone and pressed brick. There are several churches, public schools and one private school for boys. In 1918 the village erected one of the finest high schools in the State; and the new railway station and plaza, financed conjointly by the village and the Erie Railroad, is a most artistic and attractive recent improvement. There are lodges of nearly all the chief fraternal societies and a large number of social and charitable organizations. Located here is the House of Divine Providence for Incurable Patients, in charge of the Sisters of Charity. The water supply is furnished by the Bergen County Aqueduct Company. The roads in the vicinity are excellent, and the scenery in general, together with the numerous groves and small streams, make it a most charming locality. In the vicinity are many points of historic interest, their histories dating back to pre-Revolutionary days. The value of all taxable village property is \$8,500,000. The government is on the commission plan. The receipts and expenses average yearly about \$245,000. Pop. 6,800.

RIDGWAY, ridj'wā, Robert, American naturalist: b. Mount Carmel, Ill., 2 July 1850. He was zoologist to the United States geological exploration of the 40th parallel under Clarence King in 1867-69, and since 1880 has been curator of the division of birds in the National Museum at Washington. He was one of the founders in 1883 of the American Ornithologists' Union, of which he later became president. He was appointed a member of the committee at the first International Ornithological Congress at Vienna in 1885, and of that at Budapest in 1891, and the advisory council of World's Congresses at the World's Columbian Exposition. He is author of 'A Nomenclature of Colors for Naturalists' (1886); 'Manual of North American Birds' (1887); 'Birds of North and Middle America' (1901-16, of which 7 vols. have been issued); 'Color Standards and Color Nomenclature' (1912); joint author with Prof. Spencer F. Baird and Dr. T. M. Brewer of 'A History of North American Birds' (3 vols., 1874) and 'Water Birds of North America' (2 vols., 1884); 'Ornithology of Illinois' (2 vols., 1889); 'Nomenclature of North American Birds' (1881); and several hundred separate papers on ornithological subjects. He is a member of the American Forestry Association, Biological Society of Washington, Boston Society of Natural History, National Geographic Society, National Institute of Social Sciences, Philosophical Society of Washington and Washington Academy

of Sciences; corresponding member of the Academy of Natural Sciences of Philadelphia, Boston Society of Natural History, Boston Zoological Society, Chicago Academy of Sciences, Davenport Academy of Sciences, Manchester (England), Literary and Philosophical Society, Michigan Ornithological Club, New York Academy of Science and Zoological Society of London; honorary member of the British Ornithologists' Union, German Ornithological Society, Nuttall Ornithological Club and Royal Australian Ornithological Society.

He has traveled extensively in North America while engaged in ornithological exploration; two years' field work in California, Nevada and Utah (1867-69); a summer along the coast of Alaska as guest of the Harriman Alaska Expedition in 1899; two trips to Costa Rica (six months in 1905, three months in 1907) as guest of Señor Don José C. Zeledón, of San José; several trips to Florida, etc.

RIDGWAY, Pa., borough, capital of Elk County, on the Clarion River, and on the Buffalo, Rochester and Pittsburgh and the Pennsylvania railroads, about 150 miles northeast of Pittsburgh and 115 miles southeast of Erie. It is in a region devoted mainly to lumbering and agriculture. The chief industrial establishments are lumber mills, sash, door and blind factories, flour and grist mills, machine shops, engine and boiler works and dry kilns. There are other manufactories producing mining materials, proprietary medicines and tobacco products. The educational institutions are public and parish elementary schools, a public library and a private business school. Pop. 5,408.

RIDING AND DRIVING. See HORSES, RIDING AND DRIVING.

RIDLEY, rid'li, Nicholas, English ecclesiastic and martyr: b. about 1500; d. Oxford, 16 Oct. 1555. He was graduated from Cambridge in 1521-22, later studied at the Sorbonne, Paris, and at the University of Louvain. Returning to Cambridge he was made proctor to the university, and as such advocated the claims of King Henry VIII to the supreme ecclesiastical jurisdiction in the realm. Through the patronage of Archbishop Cranmer he became one of the king's chaplains; in 1540 he was appointed master of Pembroke Hall, in 1541 canon of Canterbury, and in 1545 an additional canonry of Westminster was conferred upon him. In 1547 he was elevated to the see of Rochester. In 1550, on the deposition of Bonner, Ridley was made bishop of London, and distinguished himself by his tempered zeal in favor of Protestantism, and especially by his liberality and kindness toward the family of his predecessor. In 1553 in a sermon before Edward VI he made an appeal for the destitute London poor, and as a result of subsequent conferences the king and corporation of London determined to build Christ's Hospital, Saint Thomas' Hospital and Bethlehem Hospital. On the death of Edward he was induced to listen to those who attempted to secure the Protestant ascendancy by placing the Lady Jane Gray upon the throne. The defeat of this scheme, the active part he had taken in the establishment of the new discipline and the construction of the liturgy, together with his connection with Cranmer, marked Rid-

ley out as one of the most prominent opponents of Queen Mary. He was arrested and sent to the Tower 20 July 1553. In the spring of 1554 he was removed to Oxford, and being brought before the royal commissioners and refusing to recant he was excommunicated. His further trial progressed slowly. The next year Parliament passed penal laws against heretics and under these he was summoned to trial. His condemnation followed upon his admitting the truth of the principal charges against him, and he was burnt at the stake in company with Hugh Latimer.

RIDPATH, John Clark, American educator and historian: b. Putnam County, Ind., 26 April 1840; d. New York, 1 Aug. 1900. He was graduated from Asbury University, Indiana, in 1863, and in 1864 was appointed principal of the academy at Thornton, Ind. In 1866 he was superintendent of public instruction for Lawrenceburg, Ind., and in 1867-69 professor of languages at Baker University, Baldwin City, Kan. In 1869 he was appointed to the chair of English at Asbury, and in 1879 became vice-president of the university. The endowment of \$2,000,000 bestowed upon the university by Mr. De Pauw was secured largely through Ridpath's efforts, and under his management it received its new name of De Pauw. After his resignation from the university he devoted himself to literature. He was one of the editors of the 'People's Cyclopædia' (1881) and published 'Academic History of the United States' (1874-75); 'Popular History of the United States' (1877); 'Life of James A. Garfield' (1882); 'Cyclopædia of Universal History' (1880-84); 'Great Races of Mankind' (1893); 'Life and Times of Gladstone' (1898); 'History of the United States' (1900), etc.

RIEDELSE, rē'dē-zēl, Frederica Charlotte Louisa (Vow Massow): b. Brandenburg 1746; d. Berlin, 29 March 1808. She was the wife of Baron Riedesel (q.v.) and accompanied her husband to America. After Burgoyne's surrender she resided for a year at Cambridge, Mass., where a street has since been named in her honor; and later at Charlottesville, Va. She wrote graphic descriptions of the campaign and subsequent events, published after her death by her son-in-law, Count von Reuss, and translated inadequately into English in 1827 ('Letters and Memoirs Relating to the War of American Independence, and the Capture of the British Troops at Saratoga'), and worthily by W. L. Stone in 1867 ('Letters and Journals Relating to the War of the American Revolution').

RIEDELSE, Friedrich Adolph, FREIHERR ZU EISENBACH, German soldier: b. Lauterbach, Hesse, 3 June 1738; d. Brunswick, 6 Jan. 1800. He studied at the Marburg law school, but before the completion of his course enlisted in a regiment of Hessian infantry as vice-ensign, and soon afterward went to England with his regiment, which had been made part of the British army, and was billeted on a town near London. There he became fairly proficient in English. On the outbreak of the Seven Years' War in 1756, the regiment was sent to Germany and Riedesel served on the immediate staff of Duke Ferdinand of Brunswick. Shortly after the outbreak of the American Revolution, England negotiated with several of the petty sovereigns of Germany for some 20,000 troops.

Of these about 4,000 were from Brunswick. Riedesel was promoted major-general and placed in command of the Brunswick contingent, and on 1 June 1776 he reached Quebec. A thorough disciplinarian, he practised his troops in the American mode of fighting, particularly in rapidity of firing, in which the Continentals were much more efficient. He accompanied Burgoyne (q.v.) on the ill-fated expedition of 1777, distinguished himself at Ticonderoga, and at Hubbardton brought up reinforcements and dispersed the Americans. At Freeman's Farm, 19 Sept. 1777, he saved the British from rout by arriving with his Brunswickers; and, after the action on 7 October, had his counsels prevailed, Burgoyne would probably have made a successful retreat to Canada. He was taken prisoner at Saratoga 17 October, exchanged in 1779, and in that year appointed to a command on Long Island. In 1783 he returned to Germany, in 1787 was promoted lieutenant-general, and in 1788 commanded the Brunswick portion of the army sent from Germany to Holland to assist the Stadtholder. From 1794 until his death he was commandant of the town of Brunswick. The 'Leben und Wirken des General-Lieutenants F. A. Riedesel, nebst vielen Original-Correspondenzen und historischen Aktenstücken,' by von Eelking, appeared in 1856. An abridged translation into English by W. L. Stone was published in 1868. It affords a most complete and accurate account of Burgoyne's expedition, as well as a clear view of contemporary affairs in Canada.

RIEGER, rē'gēr, Franz Ladislaus, BARON VON, Bohemian statesman: b. Semil, 10 Dec. 1818; d. Prague, 3 March 1903. He studied law at Prague, received a government service appointment and in 1848 he was elected to the Austrian Reichsrat. After a period of activity as one of the leaders of the Slavic party he remained in the background until 1861, when with Palacky he led a movement demanding the restoration of the Bohemian monarchy, including Moravia and Silesia, and that Bohemia should occupy in the empire a place similar to that of Hungary. Rieger's power was gradually encroached upon by the Young Czechs, he remaining the head of the Old Czechs, and in 1891, after 30 years of leadership, he was defeated by the young party. He was ennobled in 1897 and took his seat in the Austrian House of Peers.

RIEGO Y NUNEZ, rē-á'gō ē noo'nyáth, Rafael del, Spanish revolutionist: b. Santa María de Tufia, 24 Oct. 1785; executed, Madrid, 7 Nov. 1823. He studied law at Oviedo, entered the army in 1807 and was in command of a battalion at the time of the French invasion of 1808. He was taken prisoner at the battle of Espinosa de los Monteros in November 1808 and was held a prisoner in France until 1814, when he escaped. He visited Switzerland, Germany and England and then returned to Spain through the aid of the English. He remained in the army and in 1820 became the leader of the revolutionary movement which secured the restoration of the Cortes constitution of 1812. He was placed in command of the forces in Aragon as field marshal and captain general, but was discontented with the appointment, feeling that his services deserved high place in the new government.

He was elected to the Cortes in 1822 and chosen its president, 17 Feb. 1823. He met the French invasion with considerable determination but was taken prisoner after several unsuccessful actions, then fell into the hands of royalist volunteers, by whom he was taken to the capital and executed. His revolution failed to benefit Spain as he was unable to keep the forces he had released under control and the country suffered severely between the intrigues of royalty and the uncontrolled conduct of Riego's followers. Spain's popular revolutionary song, the 'Hymn of Riego' was named for him. Consult Riego, 'Memoirs of Riego and His Family' (1824); Baumgarten, H., 'Geschichte Spaniens' (1865-71).

RIEL, rē-ēl', Louis, Canadian insurgent: b. Saint Boniface, Manitoba, 23 Oct. 1844; d. Regina, Northwest Territory, 16 Nov. 1885. He belonged to the Métis race of Franco-Indians and as protégé of Archbishop Taché, was educated at the Jesuit College at Montreal. In 1869 he took part in the protest raised by the native tribes against the establishment of Canadian authority in the territories lately acquired from the Hudson Bay Company and was elected president of a provisional government established at Fort Garry. The rebellion was suppressed the next year by a force under Sir Garnet Wolseley and Riel fled from the territory. In 1873 he was elected to the Dominion parliament for Provencher, but was not permitted to take his seat and after two subsequent re-elections a warrant of outlawry was issued against him and he was sentenced in 1875 to five years' banishment with forfeiture of political rights. In 1884-85 he headed a party of half-breeds in another insurrection, which was soon suppressed. Riel was taken prisoner, convicted of treason and executed. See **RIEL'S REBELLION**.

RIEL'S REBELLION, or the Northwest Rebellion, was an outbreak of the half-breeds and Indians of the valley of the Saskatchewan, in the spring of 1885, promptly suppressed by the Canadian militia. For some time past discontent had been rife among the half-breeds, or Métis, of that district, who feared that the surveying of the country by the Dominion government and the government sales of land to incoming settlers would dispossess them of their homesteads. In June 1884 Louis Riel, the half-breed leader of the abortive outbreak of 1869-70, returned by invitation from Montana and put himself at the head of the movement. At a gathering at Saint Laurent, on the Saskatchewan, September 1884, a "Bill of Rights" was adopted asking that the half-breeds should receive the same grant of 240 acres per capita that had already been given (1870) to their kinsmen in the province of Manitoba. With this demand were coupled more extravagant pretensions to further reservations of land and grants of money. Various petitions had already been sent to the Dominion government in behalf of the half-breed claims. A commission had been appointed to consider them, but the whole matter aroused so little public attention in Canada that the news of the actual revolt in March 1885 came with alarming suddenness. On the 17th of that month the Métis formed a provisional government, with Louis Riel (q.v.) as president, Gabriel Dumont as adjutant-

general, and a numerous council. All obtainable stores were seized, supplies on the way to Prince Albert intercepted and the telegraph wires cut. At the same time every effort was made to arouse the Indians of the Saskatchewan district, detachments of whom, under Beardy and One-Arrow, at once joined the rebels. The only forces immediately available to cope with the outbreak were about 500 mounted police, scattered in small detachments over the Northwest Territory, of whom some 200 men of all ranks were distributed between Prince Albert, Fort Carlton, Battleford and Fort Pitt. The rebels demanded the surrender of Fort Carlton, a mounted police post on the North Saskatchewan, 40 miles above Prince Albert, held by Major Crozier with a handful of men. Crozier refused, and succeeded in communicating with Prince Albert and obtaining a reinforcement of 40 volunteers. With the help of these he attempted (26 March) to secure the stores from Duck Lake, a post a few miles distant. Here occurred the first bloodshed of the rising. The rebels attacked Crozier near Duck Lake, and forced him to retire to Carlton with a loss of 12 killed and 12 wounded. The mounted police burned the fort at Carlton and retired to Prince Albert. The news of the fight at Duck Lake occasioned intense excitement throughout Canada. Immediate steps were taken to despatch an adequate force of militia to the northwest. General Sir Frederick Middleton, the commander-in-chief, was already on his way. On the 28th of March there was a general call to arms of the militia forces, picked troops from the different regiments being at once forwarded to the front. Various corps of scouts, rangers, cavalry, etc., were specially organized. Eighteen hundred troops started from Ontario and Quebec within six days of the call to arms, and within a month 3,000 men had been transported to the northwest and 1,500 raised in Manitoba and the territories. The area of operations was the valley of the Saskatchewan River, whose north branch runs from west to east through the province of the same name and now in the territories of the Canadian Northern and Grand Trunk Pacific railways. On this river were the posts of Prince Albert, Battleford, situated about 160 miles farther up the river, and Fort Pitt, also on the river, 120 miles northwest of Battleford. The main body of rebels had established themselves at Batoche, on the South Saskatchewan, a river flowing from the southwest to meet its confluent on a long V-shaped angle. Mustering his forces at Qu'Appelle and Swift Current, Middleton resolved to strike into the rebel territory in two columns. The main column, under Middleton, was to move northward on Clark's Crossing, a ferry station on the Saskatchewan about 40 miles by trail from Batoche. A second, under Lieutenant-Colonel Otter, was to march from Swift Current (140 miles west of Qu'Appelle) to the relief of Battleford. A third force, gathered at Calgary, was to descend the route of the North Saskatchewan from Edmonton, thus reaching Fort Pitt. Meantime the position of affairs appeared extremely critical. Some 500 Indians in the neighborhood of Battleford had risen under Poundmaker, a Cree chief, laid siege to the stockade fort in which the whites had taken

refuge, and plundered the stores of the town. Near Fort Pitt the Indians had also risen under Big Bear, and at Frog Lake, a post about 30 miles distant, on Good Friday (3 April) they plundered the stores and shot down nine persons in cold blood. The news of the massacre spread terror throughout the unprotected valley of the upper river, the settlers fleeing toward Edmonton. Many of the deserted houses were looted and burned. The advance was carried out with admirable success. The main column, the Royal Grenadiers, A Battery and other troops, traversing in forced marches 177 miles of prairie, struck the South Saskatchewan at Clark's Crossing. Advancing northwards down the river, they came upon the rebels strongly posted in a wooded ravine called Fish Creek, in which they had constructed rifle pits. A sanguinary contest ensued (23 April). The rebels, led by Gabriel Dumont, defended themselves stubbornly, but were ultimately dislodged. The loss of the militia was 10 killed and 40 wounded. The second column, under Otter, consisting chiefly of Queen's Own men, left Swift Current 13 April, and after a march of 202 miles successfully relieved the beleaguered fort at Battleford. From there Colonel Otter determined to strike at Poundmaker's reserve, against which he moved on 1 May, with a force of 325 men and three guns. They came upon the Indians in force at Cut Knife Hill, and after a severe engagement were compelled to retire on Battleford, with a loss of 8 killed and 14 wounded. At the same time General Strange, with the third division, marched from Calgary to Edmonton (2 May), and thence directed his forces against Big Bear. Meanwhile General Middleton decided to move forward against the main body of the half-breeds at Batoche. The advanced season rendered possible the navigation of the South Saskatchewan, down which the steamer *Northcote*, with supplies and munitions, was despatched to join Middleton's column. Batoche was invested by the militia on 9 May, and a four days' fight ensued. The rebels were entrenched in rifle pits along the banks of the river. During the first three days the fighting was desultory, Middleton using his artillery and throwing up earthworks in order to exhaust the ammunition of the half-breeds without unduly exposing his men. The *Northcote*, that was to have aided in the attack, steamed down the river under a hot fire on the 9th, but its steering gear being disabled, it drifted past Batoche. On the fourth day a general charge of the militia resulted in a complete victory. The rifle pits and the village of Batoche were taken by storm and Riel and many of his council captured. Dumont escaped to the United States. The loss of the Canadian forces in the four days was 8 killed and 46 wounded; that of the rebels, 51 killed and 173 wounded. With the storming of Batoche the rebellion was virtually at an end. Poundmaker capitulated, and Big Bear fleeing to the north, though offering fight at Frenchman's Butte and Loon Lake, was ultimately captured (2 July). Riel was taken to Regina, where he was tried for treason-felony (July 1885). His counsel attempted to defend him on the ground of insanity, but the plea was unavailing, and he was sentenced to be hanged. Numerous petitions were sent from French

Canada in favor of commutation of his sentence, with equally urgent petitions to the contrary from various parts of the Dominion. He was hanged at Regina 16 Nov. 1885, meeting his death with great fortitude. Eight Indians were shortly after hanged at Battleford for complicity in the murders at Frog Lake, Fort Pitt and other places. Poundmaker, sentenced to three years' imprisonment, died in the Manitoba penitentiary. For further information consult the 'Official Report on the Suppression of the Rebellion, 'Ottawa' (1886); 'Dominion Annual Register' (1885); 'Reminiscences Lieut.-Col. Bolton' (1886), and 'Canada and Its Provinces' (Vol. VII, 1914).

STEPHEN LEACOCK,
McGill University.

RIEMANN, *rē'man*, Georg Friedrich Bernhard, German mathematician: b. Breselenz near Dannenberg, Hanover, 17 Sept. 1826; d. Selasca, near Iutra, Lago Maggiore, Italy, 20 July 1866. He was educated at the universities of Göttingen and Berlin, taking his doctor's degree with the thesis 'Grundlagen für ein allgemeine Theorie der Functionen einer veränderlichen complexen Grosse,' and establishing therewith a reputation for high mathematical ability. He also made valuable researches in natural philosophy. He became privat docent at Göttingen and in 1857 was appointed adjunct professor of mathematics there, becoming professor after the death of Dirichlet in 1859. His achievements in mathematics included new and highly valuable theories concerning the study of surfaces and functions, and a non-Euclidean system of geometry. His work represents a considerable advance in the science notwithstanding his short life and the fact that in his last years much of his time was absorbed in combating pulmonary tuberculosis, which caused his early death. Author of 'Ueber de hypothesen, welche der Geometrie zu Grunde liegen' (1867); 'Vorlesungen über Schwere, Elektrizität und Magnetismus' (1876); his collected works were edited by Weber, H., and Dedekind, R., and include a biographical sketch, 'Gesammelte mathematische Werke und wissenschaftlicher Nachlass' (1876; French trans. 1898).

RIEMANN, Hugo, German author and music teacher: b. Grossmehlra, near Saundershausen, 18 July 1849. He served in the Franco-Prussian War and later studied at the Conservatory at Leipzig, where in 1878 he became university lecturer on music. In 1880 he removed to Bromberg and in 1881-90 he was teacher of theory and piano at the Conservatory there. He taught at the Conservatory at Wiesbaden in 1890-95. Returning to Leipzig as lecturer in 1895, he became professor of music there in 1901 and director in 1908. He has written much and authoritatively on the teaching and theory of music, and his musical compositions are designed to aid the teaching of music. He has also edited many works of older composers. His most important work is his 'Musik-Lexikon' (1882; 8th ed., 1916) which attained worldwide recognition. He is also author of 'Handbuch der Harmonielehre' (1887); 'Jahrhundert' (1898); 'Handbuch der Musikgeschichte' (4 vols., 1901-14); 'Gross Kompositionlehre' (3 vols., 1902-03).

RIEMENSCHNEIDER, rē'mén-shni'dér, Tilman (MEISTER DILL, or TILL), German sculptor: b. Osterode, Harz Mountains, about 1468; d. Würzburg, 8 July 1531. He became a resident of Würzburg, was chosen a member of council in 1509 and burgomaster in 1520. He was prominently connected with the Peasants' War and after 1525 he was not permitted to retain his office. He lived thenceforth in retirement. He left numerous works of sculpture, the majority of which are in or near Würzburg. One of his finest works is the monument to Emperor Heinrich II and his consort Kunigunde, in the Bamberg Cathedral, finished in 1513. The figures of the emperor and his wife are somewhat more than life size and are regarded as excellent portraits besides furnishing an authoritative representation of the 15th century costume. The church at Rimpf, near Würzburg has some 20 statues by Riemenschneider. A group, 'Lamentation over the Dead Christ,' is in the church at Heidingsfeld, and there is a high relief of the same subject in the church at Maidbrunn. The latter was executed in sandstone (1525) and is believed to be his last work. He achieved a considerable reputation in foreign countries through his wood carvings and his designs for them. Among them are several beautiful altars. Consult Streit, 'Riemenschneider' (Berlin 1888), a monograph with reproductions of all his works.

RIENZI, rē-ēn'zē, Cola di, Roman popular leader: b. about 1313; d. 8 Oct. 1354. The son of an innkeeper, he became imbued with a passionate desire to re-establish the glory of ancient Rome on the ruins of the oligarchy under whose rule the people suffered. In 1343 he went to the pope at Avignon, as the representative of the Roman people, and entreated him to return to Rome and end the misrule of the nobles. The pope made Rienzi apostolic notary, and the latter returned to Rome, where he began the organization of a widespread movement for the overthrow of the aristocracy. On 20 May 1347, Rienzi summoned an assembly of the people at the capitol, and there proposed a new constitution for the state, providing for the arming of the people and the garrisoning of the walls by them, the reform of justice and the equitable distributing of taxes. He became head of the new republic with the title of tribune of the people, and by means of the popular levies forced the nobles to leave the city. Rienzi's plans included not merely the restoration of the municipal liberties of Rome, but the re-establishment of the ancient Roman state, and to that end he invited the Italian cities to send representatives to Rome for the consideration of the welfare of Italy. Though few cities responded, Rienzi, carried away by power and his own eloquence, caused himself to be crowned tribune 15 August, and bestowed the Roman citizenship on all inhabitants of Italy. The pope's hostility, however, was aroused by Rienzi's vainglorious attempt to act as arbitrator in the dispute for the Imperial throne that was then in progress, and he stirred up the Roman nobles against him. The nobles were defeated, but, Rienzi, dazzled by success, began to play the tyrant, and a second insurrection compelled him to flee the city (15 December). Later he went to Bohemia to secure the aid of Emperor Charles IV for the execution of his plans. The emperor

handed Rienzi over to Pope Innocent VI, who, however, recognized how useful the tribune might be to him in crushing the Roman nobility and therefore sent him to Rome with Cardinal Albarnoz in 1354. Rienzi's popularity was still great and he easily regained power; once more, however, he fell a victim to excess, perpetrated acts of outrage and oppression, and aroused the hatred of the people. An insurrection, stirred up by the nobles of the house of Colonna and Sarelli, broke out on 8 Oct. 1354. The mob stormed the capitol, and Rienzi, seized as he was escaping in disguise, was murdered, and his body dragged through the streets. The career of Rienzi is the subject of one of Bulwer-Lytton's novels, 'Rienzi' (1835) and of Wagner's opera, 'Rienzi,' first produced at Dresden, 20 Oct. 1842. Consult Pappencordt, 'Cola di Rienzi und seine Zeit' (1841); Auria, 'Étude historique sur Nicole Rienzi' (1888); Rodocanachi, 'Cola di Rienzi' (1888).

RIENZI, The Last of the Roman Tribunes, a historical romance by Sir Edward Bulwer-Lytton, published in 1835. It is founded on the career of Cola di Rienzi (q.v.). Bulwer was so impressed with the heroism and force of character of his hero, that at first he meditated writing his biography, instead of a romance founded on his life. The story adheres very closely to the historical facts. Many of the situations and scenes are very strong. The treatment is epic rather than dramatic; and the splendid yet comfortless civilization of the Middle Ages, so picturesque and so squalid, so ecstatic and so base, is vividly delineated. Rienzi is also the subject of a once popular tragedy by Mary Russell Mitford, first published in 1828.

RIES, rēs, Heinrich, American economic geologist: b. Brooklyn, N. Y., 30 April 1871. He was educated at Columbia University. He served on the New York State Geological Survey in 1891-92 and in 1895, and was assistant in mineralogy at Columbia in 1896-97. He became associated with the faculty at Cornell in 1892, was appointed professor of economic geology in 1905, and since 1914 has been head of that department. Author of 'Economic Geology of United States' (1905); 'Building Stone and Clay Products' (1912); and joint author of 'Clay, Occurrence, Properties and Uses, History of the Clay Working Industry of United States' (1906); and 'Engineering Geology' (1914).

RIESENGBIRGE, rē'zén-gē-bēr'gē (the Giants' Mountains), part of the Sudetic chain, separating Silesia from Bohemia and Moravia, till it joins the Carpathians. It contains the loftiest mountains of the north or central parts of Germany. Some of the principal summits are Schneekoppe, 5,257 feet high; the Borenberg and the Grand Rad, each 5,156 feet high.

RIET-BOK, rēt'bōk, the Dutch name of a South African species of antelope, *Antelope* (or *Tragelaphus*) *arundinaceus*. It is nearly five feet in length and about three feet high at the shoulder; the horns, about a foot long, are boldly annulated at the base. In color it is of a dull ashy gray, sometimes tinged with red on the upper parts and silvery-gray beneath. As its name (*riet-bok*, reed-buck) implies, it is found mostly among reeds or coarse long grass.

RIETSCHEL, rêch'el, Ernst Friedrich August, German sculptor: b. Pulsnitz, Saxony, 15 Dec. 1804; d. Dresden, 21 Feb. 1861. He studied art at Dresden, was a pupil of Rauch in Berlin and later studied in Italy. He gained recognition as a sculptor of extraordinary ability through his colossal statue of Frederick Augustus, king of Saxony, at Dresden. He was elected to the Academy of Dresden, and from 1832 until his death he was professor of sculpture at Dresden. He possessed a broad scope and excelled in many branches of his art. He was especially famous for his portrait figures, among which are those of 'Goethe' and 'Schiller' (Weimer); 'Lessing' (Brunswick); and 'Luther' (Worms). His religious pieces include the 'Christ-Angel' and the statue of 'Pietà'; and among his bas-reliefs are 'Night and Morning'; 'Noon and Twilight.' Consult his Autobiography (edited by Oppermann, 1873).

RIFF, a name given to the coast districts of northern Morocco extending from Ceuta to the western frontier of Algiers and forming a line of steep cliffs with few harbors. Its Berber inhabitants were formerly much addicted to piracy and are still noted for smuggling.

RIFLE. See **SMALL ARMS**.

RIFLE CLUBS. There are more than 1,000 rifle clubs in the United States, affiliated with the National Rifle Association of America, which is managed by the War Department at Washington. The object is to promote good marksmanship. A club must have at least 10 members and a range where they can use .22 calibre rifles. Such ranges measure 50 or 75 feet from rifle to target. Civilian clubs usually shoot at 75 feet; but college, military academy and high school clubs usually shoot at 50 feet. If outdoor ranges of 200 yards or more are available, the War Department furnishes military rifles and ammunition. Navy ranges are usually available and these furnish not only rifles and ammunition, but excellent coaching. The regular army and navy courses are used and those who qualify as marksman, sharpshooter, or expert, receive appropriate decorations. With scientific coaching in the indoor range, men with no previous knowledge of the rifle soon learn to shoot well, and seldom fail to make good with the military rifle at longer ranges. Ample information as to organizing clubs, installing ranges, securing guns, ammunition, etc., may be secured by addressing The National Rifle Association of America, 1108 Woodward Building, Washington, D. C.

RIFLEMAN, or **RIFLE BIRD**, an Australian forest-bird (*Ptilorhynchus paradisea*), closely related to the birds of paradise and so called because its colors and ornaments reminded the colonists of the old uniform of the British Rifle Brigade. The male is regarded as more splendid in plumage than any other Australian bird. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green of most brilliant lustre. The tail is black, the two central feathers rich metallic green. The female, as is often the case, is much duller colored than her mate. They obtain their insect food largely from beneath the loose bark

of trees, about which they scramble like woodpeckers. Consult Newton, 'Dictionary of Birds' (1893-96).

RIG VEDA, rîg vâ'dâ, the oldest of the four Vedas, and the oldest literary monument of the Indo-European races. The term Veda is the ancient Hindu Sanskrit word for knowledge, and the Vedas compose the great body of sacred scripture of the older Hindus, written in an ancient form of Sanskrit. The precise time of composition of the Vedas cannot be determined, but it is probable that the Rig Veda was in course of composition as early as 1200 B.C., and some authorities contend that some of the verses must have been composed as early as 1500 B.C., the latest date of composition given for any of the verses being 600 B.C. It is known that the Rig Veda was composed by many different generations, and Max Müller believed that for a long period after its composition it was transmitted orally from one to another, and was not set down in writing until a much later date, since it contains no allusion to writing or writing materials. Of the four Vedas the Rig Veda is by far the most important, not only on account of its greater antiquity but also because of the information which it contains. The most authoritative writers state that the sacred hymns of the Rig Veda are repeated in a modified form in the Sâma Veda, or chants, and in another form in the Yajur Veda, or ritual, while the fourth and latest of the Vedas, the inferior Atharva Veda, shows great modifications from the hymns of the Rig Veda, due to the introduction of superstitions, magic chants and vulgar charms. The hymns of the Rig Veda, in common with those of the three succeeding ones, are of four classes; the first and most important are the mantras, or sacred utterances, usually in metrical form; the next are the brahmanas, or explanatory inspired utterances, being the oldest Indo-European bodies of prose; last come the Sutras, divided into three classes, of which two are found in the Rig Veda; the Kalpa-Sutras, comprising largely rules of sacrifice, and the Grhya-Sutras, dealing with home life. The Rig Veda consists of 1,017 hymns or short lyric poems, with 10,580 verses. It is written in 10 books, of which six books ii-vii contain each the record of a single family or clan; book i, 15 collections, each attributed to a different poet-sage; book ix glorifies the sacred drink "Soma," and book x contains hymns supposed to have been composed by many different authors. The religion was nature worship, the chief objects of adoration being Agni, the god of fire, and Indra or Jupiter Pluvius, the cloud-compeller. The Hindu Triad had not yet arisen. The Rig Veda does not recognize the institution of caste. Beef was eaten. Women held a high position, and some of the hymns were composed by them. The rite of suttee was unknown; the conquest of Indra had only begun, and the Ganges, incidentally mentioned, had not become a sacred stream. "The home of the Rig Veda," says Professor Hopkins, of Yale University, "has been located in almost as many places as Paradise. Now it is by the Caspian Sea, now it is in Kandahar, but the Punjab is the favorite place, and quite naturally; for the poets are familiar with the Punjab, sing of it, talk of crossing its rivers, and in many ways show that

they occupied, in part at least, the country stretching from Peshawar to Delhi." (See *SANSKRIT LITERATURE; VEDA*). Consult *India Old and New: The Rig Veda*, by E. W. Hopkins (New York 1901); *The Religions of India*, by the same author (Boston 1895), and the translation by Arrowsmith (Boston 1886) of A. Kaegi's *Rigveda*.

RIGA, *rēgā*, Russia, capital of Livonia on the Dwina, seven miles from the Gulf of Riga, an inlet of the Baltic, is one of the principal seaports of the empire and ranks in trade next to Saint Petersburg and Odessa. Of the four parts into which it is divided, the old town alone preserves the Hanseatic features. It is characterized by high storehouses and spacious granaries; market place; other squares, and busy, winding streets. The Saint Petersburg division of the town is the aristocratic quarter. The "Domkirche" (1204) contains one of the largest organs in the world. Saint Peter's Church has a tower over 400 feet high. The Castle (1494-1515), built by Walter von Plettenberg, is a spacious building now occupied by the military authorities. Other places of more recent construction are: The Polytechnic, Exchange, municipal picture gallery, schools, gymnasiums and scientific and professional colleges, bonded warehouses and manufactories. At least half of the population is German, the German element predominating in the life of the city. There is an ever-increasing intellectual and commercial development. Riga is a great mart for timber from the vast White Forest, and the third city of Russia for exports, the chief of which are corn, hemp, oats, tallow, leather, tobacco, rugs and feathers. Much of the interior trade is carried on by both rail and water communications.

RIGA, Gulf of, Russia, an inlet on the east side of the Baltic Sea, 105 miles in length from north to south and about 60 in breadth. The islands of Ösel, Dagö, Mohn and Worms lie across the entrance. The chief river which falls into the gulf is the Düna; seven miles above its mouth is the important commercial seaport of Riga (q.v.), after which the gulf is named.

RIGAUD, *rē-gō*, Hyacinthe, French painter: b. Perpignan, 20 July 1659; d. Paris, 27 Dec. 1743. He arrived at Paris in 1681 and, acting under the advice of Lebrun, began to study portrait painting, taking Van Dyck for his model. In 1700 he became a member of the Academy, of which he was elected professor in 1710 and rector in 1733. His portraits are all extraordinarily successful as likenesses, his heads are full of character, and the figures have all the studied nobleness in attitude characteristic of the times; while he paints the gay costumes of the court with remarkable truthfulness and brilliancy. Among his most notable works in the Louvre are the large portraits of Louis XIV and Bossuet, of which latter a replica or copy is in the episcopal palace at Meaux.

RIGDON, Sidney, Mormon leader: b. Allegheny County, Pa., 19 Feb. 1793; d. Friendship, N. Y., 14 July 1876. He was employed in a printing office in Pittsburgh in 1812 when a manuscript entitled *The Manuscript Found, or the Book of Mormon* was offered for publication by Samuel Spaulding. The work

impressed Rigdon so much that he made a copy of the manuscript before it was returned to the author who died soon after. In 1819 Rigdon became a Baptist preacher and in 1829 made the acquaintance of Joseph Smith, with whom (according to a story denied by the Mormons) he published *The Book of Mormon*, transforming it by the addition of various pious phrases from an innocent historical romance into a new bible intended as the foundation of a new sect. He accompanied Smith to the West, assisted in founding the Mormon Church and became one of its presidents. He was one of the originators of the "new revelation" authorizing polygamy, and in 1844 on the death of Smith aspired to the leadership. He refused to acknowledge the authority of Brigham Young, was excommunicated, and returned to the East where he lived quietly until his death.

RIGG, James Harrison, English Wesleyan clergyman and educator: b. Newcastle-on-Tyne, 16 Jan. 1821; d. Brixton, 17 April 1909. He was educated at Kingswood School and in 1845 entered the Wesleyan ministry. He was a member of the London school board 1870-76; principal of the Westminster Training College 1868-1903; and a member of the Royal Commission on Education 1886-88. He edited the *Quarterly Review* for 15 years and wrote *Principles of Wesleyan Methodism* (1850-51); *The Churchmanship of John Wesley* (1868-78-86); *Dr. Pusey: His Character and Life-work* (1883); *Scenes and Studies in the Ministry of Our Lord* (1902), etc.

RIGGS, *rigz*, Elias, American missionary and linguist: b. New Providence, N. J., 10 Nov. 1810; d. Scutari, Turkey, 17 Jan. 1901. He was graduated from Amherst in 1829, from Andover Theological Seminary in 1832, was ordained to the ministry and sailed for Greece as a missionary in the same year. He continued his work in Greece from 1832-38, in Smyrna from 1838-53, and from that time was engaged in Turkey. He returned to the United States once, in 1856, for the purpose of publishing his Armenian Bible, and while waiting for the completion of the work taught Hebrew in Union Theological Seminary in 1857-58. The remainder of his life was spent in Turkey. He translated the Bible into Bulgarian, Armenian and Turkish, and published *Manual of the Chaldee Language* (1832); *Grammar of the Modern Armenian Language* (1847); *Grammar of the Turkish Language as Written in the Armenian Character* (1856); *Notes on Difficult Passages in the New Testament* (1889), etc.

RIGGS, John Davis Seaton, American educator: b. Washington, Pa., 29 Jan. 1851. He was graduated from the University of Chicago in 1878, after engaging in business in Rockford, Ill., in 1869-75. He was principal of the commercial department in Salt Lake Academy, Utah, in 1878-79, of the preparatory department in the old University of Chicago in 1879-86, and joint principal of University Academy, Chicago, 1886-87. In 1887 he organized the Granville (now Doane) Academy of Denison University, Ohio, and was its principal until 1896, when he became president of Ottawa University, Kansas. In 1905-10 he was president of Shurtleff College; traveled in 1910-11; in 1911-13 was district manager of the United

Mercantile Agency of Denver. Since 1913 he has been principal of Wolcott School, Denver. Mr. Riggs is a member of the Kansas State Historical Society, of the National Geographical Society and of the National Institute of Social Sciences. He has published 'In Latinum' (Cæsar) (1890); 'In Latinum' (Cicero) (1892), etc.

RIGGS, Kate Douglas (Smith) (Wiggin), American author: b. Philadelphia, 28 Sept. 1859. She was graduated at Abbott Academy (Andover, Mass.) in 1878; was the first to organize free kindergartens for the poor of the Pacific Coast. In 1880 she was married to S. B. Wiggin, who died in 1889, and she became the wife of G. C. Riggs in 1895, but continues to use the name of "Kate Douglas Wiggin" as a literary signature. Her reputation as a humorist was made by the sketch 'The Birds' Christmas Carol' (1888), and has been well sustained by the cleverness in description and dialogue of her succeeding volumes, among them 'The Story of Patsy' (1889); 'Timothy's Quest' (1890); 'Polly Oliver's Problem' (1893); 'Marm Liza' (1896); 'Penelope's Progress' (1898); 'Penelope's Experiences in Ireland' (1901), and 'The Diary of a Goose Girl' (1902). She also edited the anthology 'Golden Numbers' (with N. A. Smith, 1902), and various books for children.

RIGGS, Stephen Return, American missionary: b. Steubenville, Ohio, 23 March 1812; d. Beloit, Wis., 24 Aug. 1883. He was graduated at Jefferson College, Pa., in 1834, studied at the Western Theological Seminary, Allegheny, Pa., for a year, and was licensed to preach. He was sent as a missionary to the Indians in 1837, first being stationed at Fort Snelling. He set about mastering the Dakota language, and subsequently wrote nearly 50 books concerning the language, customs and history of the tribe. He was later connected with the mission at Lac-qui-parle, established one at Traverse des Sioux in 1843, and in 1854 built a boarding school for Dakota children at Hazelwood. He was chaplain to the government expedition which suppressed the Little Crow insurrection in 1862, and thenceforth divided his time between visits to the missions and his translation of the Bible into the Dakota language, which work was published before his death. Author of 'A Grammar and Dictionary of the Dakota Language' (Smithsonian Institution 1852; revised ed., 1883); 'Forty Years Among the Sioux' (1880), etc.

RIGGS, William Henry, American collector of arms and armor: b. New York, about 1838. He was the son of Elisha Riggs, the banker, of New York, and from his childhood was an ardent collector. At 15 he began the collection of Indian arms and costumes, and in 1853 he shipped from the Rockies to New York one of the earliest ethnological collections made in that region. This, unfortunately, was destroyed in a warehouse fire. At a school in France he was a fellow student with J. P. Morgan, Sr. (q.v.), and the friendship then formed became lifelong. Possessed of ample means, his association with Morgan crystallized his ambitions as a collector, and he definitely planned to make his collection of arms and armor a national one. He traveled inde-

fatigably in quest of rare and historic objects, and in 1857 settled upon Paris as the headquarters for his collection. His home there became a gathering place for a brilliant coterie of lovers of armor, of whom the emperor was one. His later years were devoted to the arranging and putting into perfect order the great collection which in 1913 he presented to the Metropolitan Museum of Art, and which is now housed there as the Riggs Collection of Arms and Armor (q.v.).

RIGGS COLLECTION OF ARMS AND ARMOR, the collection of William Henry Riggs (q.v.), presented to the Metropolitan Museum of Art in 1913 and placed on exhibition there in 1914. The collection was gathered from practically every sale of such objects, private or public, in a period beginning in the early 50's and includes intact some of the most famous collections in Europe. It is particularly rich in articles of historic as well as artistic interest, and the total number of pieces in the collection is about 2,500. These represent the cream of Mr. Riggs' collection, he having possessed at one time some 8,000 objects; but these were sorted, weeded out, many pieces of the commoner sort being exchanged for single objects of greater merit, or sold at public auction. As a private collection it was considered unrivaled. Consult 'Bulletin of the Metropolitan Museum of Art' (Vol. IX, No. 3, New York 1914).

RIGGS' DISEASE. See PYORRHOEA ALVEOLARIS.

RIGHI, ré'gē, Augusto, Italian physicist: b. Bologna, 1850. He was educated at the University of Bologna and was afterward professor at the universities of Palermo and Padua, becoming professor of experimental physics at Bologna in 1889. He has made important researches in connection with electrical conductivity, resistivity and waves, the polarization of light and the Leeman effect. He was the first to observe the double refraction of electric waves; made a series of experiments to prove the analogy of electric and light waves, and discovered the influence of magnetism over bismuth in connection with resistivity. He carried forward the investigation of electromagnetic waves, his work in this connection greatly facilitating Marconi's achievements in wireless telegraphy. He was elected a fellow of the Accademia dei Lincei at Rome, and a senator of the Kingdom. He has written many scientific articles and is author of 'Die optik elektrischen Schwingungen' (1898); 'Die Telegraphie ohne Draht' (1903); 'Modern Theory of Physical Phenomena, Radio-activity, Ions and Electrons' (trans. by A. Trowbridge, 1904); 'Strahlende Materie und Magnetische Strahlen' (1909); 'Kometen und Elektronen' (1911), etc.

RIGHI. See RIGI.

RIGHT is a claim or a title to anything whatever that can be enforced, or a claim to act, possess or enjoy anything, or the use thereof; or it may exist in the nature of a privilege or power. Right has also been legally defined "as that which one has a legal claim to do; legal power; authority, immunity granted by authority." A legal right is one which is protected by law, and the means of protection

is the remedy. The existence of a legal right implies the existence of legal remedy, for one does not exist without the other.

RIGHT-HANDEDNESS, the property or condition of being right-handed. The cause is not known. Some contend that it is racial habit, growing out of the left hand being used for unclean purposes and, therefore, not fit for eating, salutation, etc. This has not been proven. Others, like Charles Reade, contend that man should be ambidextrous, and that it is a duty in athletics to preserve the balance between the hands. The propensity in man to use the right hand in preference to the left is by some attributed to the lack of perfect symmetry in the body. If the body could be folded over from a medial line so that each organ of the one side should lie exactly on a corresponding organ of the other, the bodily structure would be highly fitted, in a mechanical sense, for the equal use of either limb, and ambidextral individuals would be the rule. The centre of gravity in the body of the average person is a little to the right of such a medial line. This makes the right side the heavier. From a series of experiments the greater weight has been estimated at about 15 ounces. On this fact is founded the mechanical theory of right-handedness, the predominance of the right hand over the left; or, more generally, of the limbs of the right side over those of the left. The extra 15 ounces, however, may be a result not a cause to right-handedness. The three-lobed right lung is more capacious and receives more air during an inspiration than the two-lobed left lung. The liver during inspiration swings toward the right side, shifting the centre of gravity farther to that side. In violent muscular exertion there is more air proportionally inhaled by the lung of the side which sustains the exertion. Under exertion of the right side the larger lung is better filled than the smaller, and the centre of gravity is removed till it is found in a line passing through the right foot; so that the right leg and foot afford a steadier basis of support than the left would do under similar circumstances. Through the greater use of the right lower limb the right upper limb comes to be preferred. In the case of a light weight, slung on the arm, the equilibrium of the body is better maintained by carrying it on the left side. If the weight be a heavy one, borne on the left shoulder, the burden is really being supported very much by the right limb, owing to the natural curve of the body toward the right side, while sustaining the pressure.

In a very few cases left-handedness has been found to accompany transposition of the viscera. But cases of genuine left-handedness far exceed in number such instances of transposition. Ferrier's researches have proved that when we see with the right eye we see with the left side of the brain. Hereditary left-handedness, if there be such a thing, may be due to the greater development of the right side of the brain. "It is practically certain," says Bastian, "that the great preponderance of right-handed movements in ordinary individuals must tend to produce a more complex organization of the left than the right hemisphere." Some think that in the evolution of man right-handedness has probably been a late acquisition. The oldest discovered records of the human race, how-

ever, suggest man to have been right-handed. Pre-historic weapons are those of right-handed individuals; many tools, etc., now in use are made for the right hand.

Right-handedness in man appears to be more persistent than the corresponding quality in lower animals. Naturalists, who observe that adult monkeys catch nuts more with the right hand, that the African elephant digs more with the right tusk, or that the Carolina parrot has a preferential claw for grasping, tell us that these habits are subject to exceptions more numerous than those of left-handedness in human beings. Another view of the whole subject is taken by some psychologists, who maintain the probability that the tendency to right-handedness is due to unrecognized spiritual causes, which underlie all phenomena of life. Since we do not know what life is, nor even how and why we are sentient creatures, the problem is wholly beyond our reach, and the ingenious theories only demonstrate man's fondness for speculation.

RIGHT OF SEARCH. In international law the right of search is the right of the lawfully commissioned cruisers and war ships of a belligerent power to stop and examine on the high seas the merchant vessels of neutral powers in order to determine whether they are carrying contraband goods, engaging in unneutral service, attempting to run a blockade and the like. It is ancillary to the right of capture, for the liability of ship or goods to capture often can be determined only after an inspection of its papers and an examination of its cargo. This right has long been recognized as one which belligerents are lawfully entitled to exercise. "The right of visiting and searching merchant ships upon the high seas," said the great English admiralty judge, Sir William Scott, in the case of the *Maria* in 1799, "whatever be the ships, whatever be the cargoes, whatever be the destinations, is an incontestable right of the lawfully commissioned cruisers of a belligerent nation—this right is so clear in principle, that no man can deny it who admits the legality of maritime capture, because if you are not at liberty to ascertain by sufficient inquiry whether there is property that can legally be captured, it is impossible to capture." The right, however, is one which belongs only to belligerents; it cannot be exercised by insurgents whose belligerency has not been recognized. Likewise, it is limited to merchant vessels and cannot be exercised against public vessels of neutral powers and of course it can be exercised only on the high seas. Neutral vessels under convoy are exempt from search. Nor may it be exercised in time of peace except where the right has been granted by treaty, as it has been done to a limited extent for the purpose of putting an end to the slave trade. The assertion and exercise of such a claim by Great Britain during the early part of the 19th century was vigorously contested by the United States and in 1858 it was definitely abandoned by the British government. There are certain well-recognized rules governing the exercise of the right. The pursuing cruiser may, if it wishes, chase under false colors but before beginning the search the true flag must be hoisted. Resistance to the exercise of the right of search

renders the vessel and its cargo liable to capture and condemnation. It is customary to summon the vessel to stop by firing a blank cartridge, as a signal to heave to. This is called the *semence* or affirming gun. A searching party then goes aboard, examines the ship's papers with a view to verifying its nationality, investigates the nature of the cargo and inquires into the ports of departure and destination. There are well-settled rules regarding the number of men who may constitute the searching party, the number and kind of arms they may take aboard, the manner in which the search shall be conducted, etc. Nearly all prize regulations stipulate that the crew shall be treated courteously and that the vessel shall be subjected to as little delay and inconvenience as possible. If the search reveals the presence of contraband, evidence of an intention to violate a blockade and the like, the vessel may be seized, taken into a home port and placed in the custody of a prize court in order that the validity of the capture may be judicially determined. Otherwise it should be released and allowed to proceed on its voyage. During the Great European War of 1914-17 the American government protested against the action of British cruisers for taking American vessels into distant ports "on suspicion not amounting to evidence" and for detaining them for long periods of time for the purpose of discovering evidence of hostile destination. The American government contended that the right of search could only be exercised on the high seas at the time and place of capture and if the examination did not show the presence of contraband or intent to violate a blockade the vessel should be released. To this protest the British government replied that effective searches at sea under modern conditions was impossible. Modern ships are so large and their cargoes so huge that if the right of search is to be effective it is necessary that the ships be taken into port and the cargoes removed in order that each parcel may be examined or weighed. The evidence in many cases showed that contraband articles like rubber and copper had been packed in bales of cotton and the presence of such articles could be determined only by a more thorough examination than was possible at sea. To take a ship into port, it was argued, was not the assertion of a new belligerent right but rather the adaptation of an existing right to modern conditions of commerce. It has been suggested that the necessity of detention in such cases and with it the ruinous delays to which shippers are exposed might be removed by the adoption of a system of official certification whereby neutral vessels could carry, if they chose, satisfactory assurances that their cargoes consisted only of the goods described in their manifests. In some instances during the war such certificates were in fact issued by the United States customs officials and in other cases by British consuls under whose supervision the cargoes were laden on board, but the British government declined to recognize them as conclusive, on the ground that the certificates afforded no assurance against subsequent augmentation of the cargo at sea. In some cases, it may be remarked, treaties have been concluded between the United States and certain foreign powers providing that certificates of this kind shall be accepted by the contracting parties, if one should be

belligerent and the other neutral, as conclusive that the cargo is not contraband.

Bibliography.—Aside from the general treatises on international law see Atherley-Jones, 'Commerce in War,' Chapter V, and Garner, 'Contraband, Right of Search and Continuous Voyage' (*American Journal of International Law*, April 1915, pp. 372 ff.).

JAMES W. GARNER.

RIGHT OF WAY, the right to pass over a certain route or track in going from one place to another. Such a right is a public right of way if enjoyed by everybody; private if enjoyed by a certain person or description of persons (as the residents of a particular farm). Wherever there is a public right of way there is technically a highway, though the phrase is not used in connection with regularly-kept-up public roads, but generally with mere paths, tracts or by-roads. The origin of a public right of way is generally said to be by dedication of it to the public by the owner of the soil.

RIGHT WHALE, the most important of the baleen whales. See **WHALE**.

RIGHTS, Civil. One of the clearest definitions of an authoritative character declares: "Civil rights are those which appertain to citizenship and which may be enforced or redressed by a civil action. Also a term applied to certain rights secured to all citizens of the United States by the Thirteenth and Fourteenth Amendments of the Federal Constitution, and by congressional action thereunder, and by State legislation." Bouvier says "these consist of acquiring property, of exercising the paternal and marital powers, and the like." Civil rights in full are extended in this country to aliens as well as to citizens. All residents alike enjoy such powers which can only be denied under a sentence of civil death. Civil rights have been divided into *absolute* and *relative* rights. *Absolute* rights are those generally considered as inherent to humanity. Of such is the right of personal security permitting of the individual's enjoyment, legally and uninterruptedly, of the use of his limbs, his body, his health and his reputation; the right of his personal liberty, consisting of the power of locomotion, of changing situation, or betaking one's person to other places according to inclination and under no outside direction or restraint, except by due process of law. Under the division *absolute rights* is placed the right of property, allowing the free use, enjoyment, and disposal, all his legally acquired acquisitions, uncontrolled and undiminished, subject alone to the laws of the country. *Relative* civil rights include those which subsist between the people and the government, such as the peoples' right to protection at the hands of the government; the right of allegiance which is due to the government at the hands of the people; the rights of husband and wife, parent and child, guardian and ward, master and servant, reciprocally. Belonging to such *relative* civil rights would appear to be those which Blackstone defines as follows: "The rights of persons that are commanded to be observed by the municipal law are of two sorts: first, such as are due from every citizen which are usually called *civil duties*, and, secondly, such as belong to him, which is the more popular acceptance of *rights* or *jura*."

As to precedence of civil rights Bouvier says: "The idea of rights is co-existent with that of authority (or government); both are inherent in man; but if we understand by government a coherent system of laws by which a State is ruled and if we understand by State a sovereign society with distinct authority to make and execute laws, then rights precede government, or the establishment of States. . . ." An accepted judicial decision says, in distinguishing civil from natural rights: "By civil rights, I understand those rights which the municipal law will enforce, at the instance of private individuals, for the purpose of securing to them the enjoyment of their means of happiness. They are distinguished from natural rights, which would exist if there were no municipal law, some of which are abrogated by municipal law, while others lie outside of its scope and still others are enforceable under it as civil law." Johnson, distinguishing civil from political rights gives the following definition: "A right accorded to every member of a distinct community or nation," whereas a political right is a "right exercisable in the administration of government," such as rights of voting on elections. "Civil rights . . . have no relation to the establishment, support, or management of the government," Bouvier says. Certain apparently inherent rights of the citizens may not be *actual* rights so far as the laws of the country are concerned. Thus some rights, termed often *rights of privacy*, such as "one's right to one's face," the prohibition of holding of a private citizen's character up to ridicule, etc., found no place in court. The former case seems to make legal conditions clear. Until quite recent legislation no redress was available in repeated attempts to hinder the use of portraits of living persons for use in advertising, etc., without that person's consent. But under present legislation the usage of a living person's lineaments without obtained permission of the "owner" is illegal and the civil right of the citizen to his own likeness now prevails, whereas the "holding up to ridicule" of the private person's character (except upon proof of malicious intent, libel, etc.), fails still to find a "remedy" in the courts.

RIGHTS, Declaration and Bill of. See **BILL**.

RIGHTS, Legal. Bouvier says legal rights "are those where the party has the legal title to a thing; and in that case his remedy for an infringement of it is by an action in a court of law. Although the person holding the legal title may have no actual interest, but hold only as trustee, the suit may be in his name, and not, in general, in that of the *cestui que trust*." Legal rights are those which permit a capacity to reside in one man to control "with the assistance of the State, the action of others." They are the rights which can be enforced in a civil action. A universally accepted judicial decision says: "The very idea of legal right is, that it is one which is enforced and protected by the law, and as this can only be done by the remedy, the coercive means, whatever they may be, which the law affords for that purpose, it is plain that no one can have a legal right in that which another may take and apply to his use, and for doing so the law will find no redress." The term "remedy," in its comprehensive mean-

ing, is the "means employed to enforce a right or redress an injury, including not only application to court, but any other lawful mode of obtaining satisfaction." A legal proverb runs "no wrong without a remedy." This assertion has been long held by jurists as nonimpugnable, and the claim remains that "where the law recognizes a right it gives a remedy to enforce it or redress its violation." By extension the courts hold that "right and remedy are reciprocal." And whether by common law or by statute such a right obtains it makes no difference. A distinguished authority says: "When there is an invasion of primary rights, then and not till then, the adjective or remedial law becomes operative and under it arise rights of action." The legal right to an action at law does not exist until there has been a wrong, a violation of a legal right.

RIGHTS OF MAN, Declaration of the, a famous statement of the constitution and principles of civil society and government adopted by the French National Assembly in August 1789. It suggested the title for Paine's defense of the French Revolution against Burke (1791-92); which was followed by Mary Wollstonecraft Godwin's 'Vindication of the Rights of Women' (1798). In 1832 the Society of the Rights of Man was founded in Paris. Consult Abbot, L., 'Rights of Man' (Boston 1901); and for the text of the French declaration, Robinson, J. H., 'Readings in European History' (2 vols., New York 1903).

RIGI, ré'gi, or RIGHI, Switzerland, in the canton of Schwyz, an isolated mountain rising precipitously between Lakes Zug and Lucerne to a height of 5,905 feet. It may be ascended by two railways of special type and affords fine views on which account it is much visited by travelers who visit Rigi in large numbers.

RIGOR MORTIS, the rigidity of the body which comes on after death. It varies in the time of its appearance and also of its duration, sometimes setting in within a few minutes, at other times not for many hours and lasting in some cases but a very brief period, in others for several days. It is believed to be due to the coagulation of fluid substance in the muscular system which occurs after the withdrawal of nutrition from the tissues. Decomposition begins when relaxation of the body follows the passing of the rigor.

RIIS, rés, Jacob Augustus, American journalist, author and social reformer: b. Ribe, Denmark, 3 May 1849; d. 1914. He came to the United States in 1869 and worked at different trades, until he became a reporter on the *New York Sun*. In this work he gained a thorough knowledge of the conditions in the slums of the city, and by his lectures and writings aroused interest in reforms in the tenement-house district and became a leader in the reform movement. When Theodore Roosevelt was police commissioner, Riis' thorough knowledge of the city was of the greatest aid to him and the commissioner was usually accompanied on his all-night tours of investigation by Riis. Under the leadership of the latter, police station lodging-houses were abolished, small parks in crowded districts opened, playgrounds equipped and many tenement-house evils done away with.

He, however, held but one official position in connection with this reform work, that of secretary of the New York Small Parks Commission in 1897. His first book was 'How the Other Half Lives,' published in 1890; other writings are 'The Children of the Poor' (1892); 'Nibsy's Christmas' (1893); 'Out of Mulberry Street' (1898); 'A Ten Years' War' (1900); 'The Making of an American,' an autobiography (1901); 'Battle with the Slums' (1902); 'Peril and Preservation of the Home' (1903); 'Theodore Roosevelt, the Citizen' (1904); 'The Old Town' (1909); 'Hero Tales of the Far North' (1910); 'Neighbors: Life Stories of the Other Half' (1914).

RIKER, ri'kér, Andrew L., American automobile engineer and designer: b. New York, 22 Oct. 1868. He was graduated at the Columbia Law School, but early turned his attention to automobile construction. He built one of the first electrically propelled vehicles in the United States; produced the first toothed armature; and has designed numerous automobile parts, as well as dynamos, motors, transformers and electric systems. He was also a pioneer in building electric trucks. He was awarded a medal from the French government for an automobile design in 1900; and in 1912 he became vice-president of the Locomobile Company of America. One of the first presidents of the American Society of Automobile Engineers, he was in 1915 appointed to the Naval Advisory Board as a representative of that society.

RIKKI TIKKI TAC. In spite of solid qualities, the popularity of 'Rikki Tikki Tac,' like that of many of the stories of Henri Conscience, is due in part to adventitious elements; for considered purely as a work of art it must stand on a lower plane than many another brief romance of its type. In construction of plot and the handling of incident its author here fails to show that deftness and sureness of touch which characterize the work of other masters, like Merimée or Turgenieff or Stevenson. Its appeal, as so often in the case of Conscience's work, is to sentiment. A life of hardship and suffering patiently borne and a love which triumphs through adversity provide a characteristic theme of life in Flanders in the days of Napoleon and after, and through it all, like sad, remembered music, runs the long, inexplicable, haunting refrain of the blacksmith's song. This with the description of the acrid smell of fires of sod, the shrilling of the cricket, the monotonous wide stretch of plain about Antwerp and the sense of tenderness, homesickness and loneliness, testify to the patriotic interest and homely, simple faith of its author.

CHRISTIAN GAUSS.

RILEY, ri'h, Charles Valentine, American entomologist: b. London, England, 18 Sept. 1843; d. Washington, D. C., 14 Sept. 1895. He was educated at Dieppe and at Bonn, and in 1860 came to the United States where he spent three years in studying practical agriculture. He then engaged in newspaper work and in 1864 went to the front in the Union army. In 1868 he was appointed State entomologist of Missouri and in that year assisted in founding the *American Entomologist*. He was president of the Academy of Science at Saint Louis

in 1876-77, chief of the United States entomological expedition to investigate the locust plague in 1877, and in 1878 became United States entomologist in the Department of Agriculture, an office which he occupied until 1894 with the exception of 1879-80 when conducting the cotton-worm investigation. In 1884 he was appointed curator of the National Museum and also became general secretary of the American Association for the Advancement of Science. He invented the "cyclone" or eddy chamber in nozzles for spraying purposes and made numerous discoveries of methods to control insect pests. His publications include 'Annual Reports on the Insects of Missouri' (9 vols., 1868-77); 'Annual Reports as Entomologist of the Department of Agriculture'; 'Potato Pests' (1876); 'Locust Plague in the United States' (1877); 'The San José Scale' (1895), etc.

RILEY, (Isaac) Woodbridge, American scholar: b. New York, 20 May 1869. He was graduated at Yale in 1892, and took the degrees of A.M. and Ph.D. there in 1898 and 1902 respectively. He was Johnston research scholar at Johns Hopkins University in 1904-07, and in 1908 became professor of philosophy at Vassar College. Since 1903 he has been associate editor of the *Psychological Bulletin*. Author of 'The Founder of Mormonism' (1892); 'American Philosophy' (1907); 'American Thought' (1915).

RILEY, James Whitcomb, American poet: b. Greenfield, Ind., 7 Oct. 1853; d. Indianapolis, Ind., 22 July 1916. Being one of those who never grow old, Mr. Riley was particularly sensitive on matters pertaining to his age, and the year of his birth is uncertain, some supposing that he was born as early as 1848. He was the son of Reuben A. Riley, a lawyer and politician, of Greenfield, Ind., and was educated to follow in his father's footsteps. The young man, however, didn't fancy law, and after a little elementary schooling he left home and became an itinerant sign painter. For 10 years he roamed the Ohio Valley, painting commercial signs on fences and farm outhouses. His clever sketches attracted wide attention and won praise from his employers. He led this free and easy existence, as happy and carefree as one could imagine, until the late seventies, when he obtained employment on a newspaper at Anderson, Ind. He then began to write verses, but received little encouragement. Then, in 1877, for the purpose of proving that his verses under a famous name would receive recognition, he perpetrated the famous "Poe Hoax." By arrangement with J. Oscar Henderson, publisher of the *Dispatch* of Kokomo, Ind., Mr. Riley wrote and Mr. Henderson printed a poem in the style of Edgar Allan Poe, to which he gave the characteristic title of 'Leonanie,' and it was offered to the public as a hitherto unpublished product of the genius of Poe. This poem, it was stated, had been found written on the fly-leaf of a copy of Ainsworth's 'Dictionary.' A traveler had discovered the treasure in the sitting-room of an old inn near Richmond, Va., and had taken it away with him. The publication of the poem and the accompanying story excited interest throughout the country, and Mr. Henderson was called upon to produce the book in which it was written.

In some quarters the poem was accepted as genuine; in others it was denounced as a fraud and its alleged discoverers as imposters. To Riley's delight it proved that he was a real poet; but the storm of protest that the ultimate disclosure aroused made him think he had ruined his future with the public. He shouldered the burden and returned to sign-painting. For a time he traveled as a sort of minstrel with a patent-medicine vendor and played the violin to attract crowds to be solicited to buy nostrums. In the midst of these dismal days came a letter from the Indianapolis *Journal* inviting Riley to contribute and promising him real money for his verse. In the early eighties, therefore, he settled in Indianapolis and began writing verses in the "Hoosier" dialect for the *Journal*, publishing 'The Old Swimmin'-Hole' and 'When the Frost is on the Punkin,' and other poems under the pseudonym of Benj. F. Johnson of Boone, which justly won him a great reputation in the West. He sent some of his poems to Henry Wadsworth Longfellow and received warm praise. In 1887 he participated in the Copyright Readings in New York City where he received the distinction of being invited, after his first appearance, to reappear on the second program, on which occasion James Russell Lowell gave him a high tribute. After this all the magazines clamored for his verse, and he began to sell his poems by volumes. Publication of books of poems year after year brought Mr. Riley wealth and wide recognition of his literary genius, and not alone in the genre form. Many of his poems are of imaginative fantasy or are gently philosophic. In 1902 he received the degree of master of arts from Yale University and in 1904 the University of Pennsylvania conferred upon him the degree of doctor of letters. In July 1911 the poet presented to the city of Indianapolis property valued at \$75,000 for a site for a public library and school administration building. Mr. Riley had collected 'The Old Swimmin'-Hole and 'Leven More Poems' into a little paper-backed book sold over the newspaper counter in 1883. In 1885 he published an unpretentious volume called 'The Boss Girl and Other Sketches' (now called 'Sketches in Prose'). In 1887 he brought out 'Afterwhiles,' followed by 'Pipes O'Pan at Zekesbury' (1888); 'Nye and Riley's Railway Guide' (1888); 'Old-Fashioned Roses' (1888); 'Rhymes of Childhood' (1890); 'The Flying Islands of the Night' (1891); 'Green Fields and Running Brooks' (1892); 'Pomes Here at Home' (1893); 'Armazindy' (1894); 'A Child World' (1896); 'Rubaiyat of Doc Sifers' (1897); 'Riley Child-Rhymes' (1898); 'Riley Love-Lyrics' (1899); 'Home Folks' (1900); 'Riley Farm-Rhymes' (1901); 'The Book of Joyous Children' (1902); 'An Old Sweetheart of Mine' (1902); 'His Pa's Romance' (1903); 'A Defective Santa Claus' (1904); 'Out to Old Aunt Mary's' (1904); 'Riley Songs o' Cheer' (1905); 'While the Heart Beats Young' (1906); 'The Boys of the Old Glee Club' (1907); 'Morning' (1907); 'Home Again With Me' (1908); 'Old School Day Romances' (1909); 'The Girl I Loved' (1910); 'The Lockerbie Book' (1911); 'Old Times' (1915). In 1902 'That Old Sweetheart of Mine' was published individually in a volume illustrated by Christy. Since that

date many special editions of Riley's works have been printed until the total numbers 70. The 'Biographical Edition' of his complete works was published in 1913. In 1910 Riley experienced an illness that brought him very near death. In the next year his birthday was celebrated in the schools of Indiana and of New York City. In 1912 the celebration became more wide-spread, and Greenfield, his birthplace, gave him a "Riley Day." In 1913 the school children of Indianapolis paraded past his home on Lockerbie street, and "Riley Days" were held at Anderson, Indiana University and Cincinnati, Ohio, which places he visited. In 1914 the celebration was continued, and in 1915 Governor Ralston of Indiana issued a proclamation making Riley's birthday a day of celebration throughout Indiana. On the afternoon of his birthday a musical festival was given to him at which his poems were sung and danced and acted out in pantomime, and in the evening a banquet was given in his honor, which was attended by representatives from all sections of the country. James Whitcomb Riley is known as "The Hoosier Poet" and is often referred to as "The Burns of America." A poet of the people—his own people—was Whitcomb Riley. Born among them when the Middle West was a big pasture, he lived and died among them when it had grown to be an industrial empire. Dreaming their dreams, singing their songs, sharing their joys, sorrows and fancies, he touched these things with the wand of his great genius and enshrined them in the heart of the nation. Mr. Riley was to American poetry what Mark Twain was to American prose. One measure of his success—and by no means the greatest—may be gauged by the fact that he was one of the few Americans who, having devoted their lives to poetry, was able to gain a fortune from it. Not only in America, but in all the world have children claimed James Whitcomb Riley as their own. All the sorrows, the happiness, the joy of existence have been expressed in his pages, and countless thousands have laughed and cried over them. He is the most widely read and best beloved of the singers of America. His verse occupies an unique niche in American literature. Mr. Riley never married, but he was a lover of children, whose spirit he divined so intimately, and of family life.

RILEY, John, English painter: b. Bishopsgate, London, 1646; d. there, 1691. He did not rise into notice until the death of Sir Peter Lely, but remained unsurpassed until the appearance of Sir Joshua Reynolds. He was an imitator of Van Dyck, and in both drawing and coloring must be reckoned one of the best portrait painters of his time. He painted the portrait of Charles II, who rather disconcerted the artist by exclaiming: "Is this like me? Then, odd's fish, I am an ugly fellow." He also painted James II and his queen, William and Mary, Bishop Burnet, Dr. Busby of Westminster and Lord Keeper North.

RILL MARKS, little channels cut by running water on mud surfaces. They may become buried and be preserved on rock layers. They would be found only in terrestrial sediments.

RIMBAUD, rân'bô, Jean Arthur, French poet and author: b. Charleville, in the Ardennes, 20 Oct. 1854; d. Marseilles, 10 Nov. 1891. He

early displayed unusual intellectual gifts and an erratic temperament. Some of his verses written at the age of 15 are included in the collections of his works, and before he was 17 he had run away from home three times, once being returned as a vagabond and twice because of want. At 17 he sent the poem 'Le Bateau Vivre' to Verlaine at Paris and was warmly invited to visit that poet, who hailed him as a genius—recognition that is still vouchsafed him as the pioneer of the 'decadent' movement in France. He remained in Paris until 1872, dividing his time as the guest of Verlaine and of Théodore De Banville, served in the army of the Commune, and afterward left Paris with Verlaine. They traveled in England and Belgium for 13 months and then separated after violent quarrels in which Verlaine twice attempted to kill the younger man. Rimbaud's 'Une Saison en Enfer' (1873) detailed this extraordinary friendship. It was written in prose and was the only work he ever published. He then abandoned writing verse, although but 19, wandered through Germany and Italy and in 1875 disappeared. He eventually settled at Harrar, Abyssinia, and became a trader in coffee, perfumes, gold and ivory. He amassed a great fortune, became a sort of chieftain among the natives and was engaged in intrigues with Menelek and the French government against Italy. He was forced to go to Europe in 1891 for a surgical operation upon his knee and he died in a hospital at Marseilles. Meantime, his friends supposing him dead, Verlaine had published his poems 'Les Illuminations' (1886), including the famous sonnet attributing colors to the vowels, and these have had a great influence over younger French poets. A collection of his works, with a biography, was published by his brother-in-law, Patern Bevrichoy, in 1879-98. Consult also 'Lettres de Jean Arthur Rimbaud, Égypte, Arabie, Éthiopie' (1899); Moore, G., 'Impressions and Opinions' (1891).

RIMINI, ré-mê-nê (ancient ARIMINUM), Italy, city on the Adriatic, in the province of Forlì, celebrated for its mineral springs, the sea-bathing of the adjacent Porta Marina and for the massive and elegant architecture of its chief buildings. Its fisheries are extensive. It was the seat of the celebrated Malatesta family. Pop. 50,000.

RIMMER, William, American artist: b. Liverpool, England, 20 Feb. 1816; d. South Milford, Mass., 20 Aug. 1879. He was taken to Nova Scotia by his parents in 1818 and in 1826 they removed to Boston. He studied medicine, paying his way by painting, and was a practising physician for 16 years. While he had given some attention to painting and sculpture it was not until 1860 that he achieved a really important work, the colossal head of 'Saint Stephen' carved from granite (Boston Athenæum). In 1861 he finished his 'Falling Gladiator' (Boston Museum of Fine Arts), a work which established his reputation for vigorous, powerful work and showed an accurate knowledge of the human figure. He then opened an art school in Boston and lectured at Lowell Institute and Harvard on art anatomy. He also lectured at Cooper Institute and the National Academy, New

York. It was as a teacher that he attained his greatest success. Much of his work was executed in clay by chiseling instead of modeling, and was impermanent. The permanent works he left are regarded as anatomically almost perfect and possessed of much of the vigor and simplicity of the early Greek sculptors. Besides the two already mentioned his remaining works are 'The Fighting Lions' (Boston Art Club); 'A Dying Centaur' (Boston Museum of Fine Arts), and a statue of Alexander Hamilton (Boston). He was author of 'Elements of Design' (1872); 'Art Anatomy' (1877).

RIMMON. See **RAMMON**.

RIMOUSKI, rê-moos-ké', Canada, town in the county of Rimouski in the province of Quebec, on the right bank of the Saint Lawrence River, and on the Intercolonial Railroad, 185 miles northeast of the city of Quebec. The principal occupations are lumbering and fishing; trout and salmon are abundant. It is a favorite summer resort on account of its cool climate and the opportunities for hunting and fishing. Communications by water are cut off about half the year, when the river is frozen. Pop. about 3,100.

RIMSKI-KORSAKOV, rim'skê-kôr'sâ'kôf, Nicholas Andreyevitch, Russian composer: b. Vihkvin, Novgorod, 18 March 1844; d. Petrograd, 20 June 1908. He was graduated at the Naval Academy at Petrograd in 1862, served as a midshipman in the Russian navy and made a cruise around the world, and by 1865 had produced a symphony in E minor which was the first written by a Russian composer and was performed under the direction of Balakirev. He was retired from active service in the navy in 1873 and was appointed a professor at the Petrograd Conservatoire. He became associated with a group of younger Russian composers, Borodin, Cui and Moussorsky, disciples of Balakirev, and devoted to the cause of individual national music. He was most famous outside of Russia for his symphonies, but he also wrote 13 operas, several orchestral suites and overtures and many songs and pianoforte pieces. He succeeded Balakirev as the leading conductor in Petrograd. His work was individual and placed him among the foremost Russian masters. He often introduced Russian folk-melody themes into his compositions, working out the combinations with extraordinary smoothness and richness and avoiding violent methods. Besides the miscellaneous work and symphony already mentioned he wrote two other symphonies (Op. 9 and Op. 32); and the operas 'Pskovitianka' (1873); 'The Snow Maiden' (1880); 'Mlada' (1892); 'Mozart and Salieri' (1898); 'Servilia' (1902); 'Kites' (1905), etc.

RIMU, or **RED PINE**, a New Zealand tree (*Dacrydium cupressinum*) of the yew family. It grows to a height of 40 to 80 feet, and from two to six feet in diameter. The branches are pendulous and feathery, and the leaves slender and needle-like. Its brown wood is valued for general building purposes. The young branches make good spruce beer.

RINDERPEST, a general term covering various malignant diseases of neat cattle. Rinderpest proper is an acute infectious disease of

cattle and sometimes of other ruminants, characterized by high fever, rapid pulse and cessation of milk-production during the first few days of the attack, followed by congestion and subsequently ulceration of the visible mucous membranes. The mortality is often as high as 90 per cent. This disease has been on record since the 4th century. It was first known in eastern Russia and central Asia, whence it has periodically emerged, causing havoc among cattle and heavy losses to the various European nations. From Europe it spread to Egypt. It appeared in Somaliland in 1889 and spread southward, reaching the Zambesi in 1896. It caused great loss to South African farmers and led to troubles with the natives whose cattle were affected. Inoculation with a prepared virus has given encouraging results as a means of securing immunity. The stamping out process is the only way to combat the disease.

Pleuro-Pneumonia.—This "lung-fever" is a contagious malignant disease of cattle attended by inflammation of and exudation on the pleura and in the lungs. A disease, somewhat similar, has recently attacked goats. This disease has been recognized since the close of the 18th century. At present it occurs in Europe, Asia, Africa and Australia, but is under control in Great Britain. It was introduced into the United States in 1843, and outbreaks were reported at intervals. By 1883 the disease was distributed throughout the Eastern States and as far west as Chicago and constituted a serious menace to the livestock interests of the country. No temporary measure can be used in dealing with this scourge. The only ones practicable are quarantine, restriction of movement of cattle, slaughter of affected animals and disinfection. The wisdom of such measures is vouched for by the results. Less than five years and the expenditure of only \$1,500,000 by the Bureau of Animal Industry of the Department of Agriculture at Washington sufficed to place this disease under control. No case has been reported in the United States since 1892.

Anthrax, a specific infectious disease of mammals including man, also known as splenic fever, charbon, woolsorters' disease, etc., due to the presence in the blood of the micro-organism *Bacillus anthracis*. The diseased animal may suddenly fall to the ground as in apoplexy and die, or it may live 10 to 24 hours or more in a sub-acute case. The symptoms are high temperature, muscular trembling and labored breathing with prostration. The presence of the germ in the blood is proof of the disease. All carcasses should be burned, as if buried the germs may remain in the soil or be carried in the soil water. Cattle may be immunized by inoculating with attenuated virus, with toxins or antitoxin serums. Anthrax vaccine is on sale.

Blackleg, or quarter-ill, etc., called also symptomatic anthrax, usually attacks young cattle. It is due to a bacillus. Immunity to this disease is conferred by vaccination with black-leg vaccine.

Texas, Southern, or Spanish Fever, is a contagious disease of cattle caused by a parasitic protozoan (*Pyrosoma bigeminum*), and is carried from Southern cattle to Northern cattle by the Southern cattle-tick (*Boophilus bovis*). Adult ticks fall from the cattle, lay eggs and

thus infest the soil with young ticks that carry the germs. Northern cattle passing over the ground get the ticks and subsequently the fever. When the ticks become attached to the skin they inoculate the cattle with the parasites, which in unimmune animals rapidly multiply, destroy the red corpuscles of the blood, causing high fever and a temperature of 106° F. or more, general weakness and finally death. In the later stages the urine is highly colored, showing the great loss of red blood cells, hence the name "red-water" for the disease. These symptoms and the presence of the ticks enable the disease to be recognized. Post-mortem examination reveals an enlarged spleen, containing a dark tarry substance instead of normal pulp. The ticks can be destroyed by dipping the cattle in a light lubricating oil containing dissolved sulphur. In the South cattle may be kept free from the fever by keeping them free from ticks in an uninfected enclosure. Young calves may be rendered immune by keeping ticks on them, and a considerable degree of immunity can be conferred on animals by inoculating them with the blood of Southern cattle, thus producing the fever. This disease has been widely disseminated throughout the southern parts of the United States. Thanks to the Federal quarantine from Virginia to California, established in 1899, however, so as to control the movement of Southern cattle into Northern States, the disease is steadily being restricted to smaller and smaller areas and bids fair to be exterminated.

Foot and Mouth Disease or Aphthous Fever, a contagious eruptive fever attacking cloven-footed animals and communicable to many others, including man. Eruptions occur as blisters in the mouth, on the udder, teats and feet, with an elevation of temperature of from 2 to 6 degrees. Although in mild attacks only 2 to 3 per cent of the animals attacked succumb, it depreciates the value of the survivors from 20 to 50 per cent. When present in a malignant form, 5 to 50 per cent of the adults die and 50 to 80 per cent of the calves. It is more to be feared than pleuro-pneumonia. The milk from diseased cows may transmit the disease to those partaking of it, and the disease produced in this manner is, especially when it attacks children, serious and sometimes fatal. The disease was first seen and recognized in England in 1839 where it continued with more or less prevalence until 1886, since when it has appeared less frequently. In 1870 it was introduced into the United States from Canada. The introduction of the disease into New England in 1902 drew attention to the dangers of the malady. Since then sporadic attacks have occurred in several States. Isolation and quarantining of diseased animals is futile; slaughter of diseased animals and prohibition of movement of stock in the infected areas have proved the most efficacious methods of eradicating the disease.

Tuberculosis is one of the most insidious diseases infecting cattle and other animals. Like human tuberculosis, it is due to a germ, the tubercle bacillus which may affect any part of the body where it can secure a lodgment. Recent investigations show that the same bacillus may cause human and bovine tuberculosis, hence there is need to guard against human infection with bovine tuberculosis, and particu-

larly to guard children from tuberculous milk. Plenty of good food, fresh air and sunlight, rigid cleanliness, the use of disinfectants and the determination and isolation of affected animals are now viewed as the best means of checking the disease. The tuberculin test is a ready means of determining whether or not cattle are tuberculous. Tuberculin is made by growing the bacterium for two or three weeks in bouillon to which glycerine is added. The germs are then killed by heating and their remains removed by filtration. Carbolic acid is added to prevent decomposition and the fluid is packed in sealed sterilized bottles. Inoculation with this fluid causes a rise in temperature in the case of diseased animals. See CATTLE, DISEASES OF.

Bibliography.—Consult various Reports of Bureau of Animal Industry, Washington, D. C.; also of the State departments of agriculture in many States; and bulletins of the State agricultural experiment stations.

RINEHART, rin'härt, **Mary Roberts**, American novelist: b. Pittsburgh, Pa., 1876. She was educated at the Pittsburgh High School and the Pittsburgh Training School for Nurses, and in 1896 was married to Stanley Marshall Rinehart, M.D., of Pittsburgh. She attained her first literary success through her clever mystery stories and she later became well known as a novelist and playwright. She made a tour of the western battle front under the protection of the allied governments in 1915, and after the entry of the United States into the European War volunteered as a nurse. Author of 'The Circular Staircase' (1908); 'Window at the White Cat' (1910); 'Amazing Adventures of Letitia Carberry' (1911); 'Street of Seven Stars' (1914); 'Kings, Queens and Pawns' (1915); 'Altar of Freedom' (1917); 'The Amazing Interlude' (1918); 'Dangerous Days' (1919), etc.

RINEHART, William Henry, American sculptor: b. Carroll County, Md., 13 Sept. 1825; d. Rome, Italy, 28 Oct. 1874. He apprenticed himself at 21 to a marble-worker of Baltimore, and 10 years later went to Italy where he remained two years. On his return to Baltimore he executed several busts and a fountain for the United States general post office. He did not stay long in the United States, though his success as a sculptor met with much appreciation here, but established himself in Rome in 1858. Among his best-known works are the reliefs 'Night' and 'Morning'; his highly poetic and well-wrought 'Clytie' and 'Love Reconciles with Death'; 'Latona and her Children'; 'Antigone'; 'Atlanta' and 'Endymion.' He finished the bronze doors for the national Capitol, a work bequeathed to him by Crawford.

RINES, George Edwin, American editor: b. Maitland, Hants County, Nova Scotia, Canada, 28 Dec. 1860. Coming to the United States when 11 years old, his early education was obtained in the public schools of Brooklyn, N. Y. For several years after graduation from the high school there he was engaged in mercantile life, but in 1887 resumed his studies at Colgate University, Hamilton, N. Y. In 1890 he entered the full Hebrew and Greek course in theology and was graduated from the Hamilton Theological Seminary in 1893. He was for two

years pastor at Binghamton, N. Y., afterward accepting a call to the pastorate of the First Baptist Church of Ridgewood, N. J., where he remained for three years. He resigned from the ministry in 1899 to devote himself to literary work, and has been a frequent contributor to religious and other periodicals. In 1903 he was appointed managing editor of the 'Encyclopedia Americana,' to which he contributed many articles. Subsequently Mr. Rines was managing editor of the 'United Editors' Encyclopedia,' and in 1910-11 was general editor of 'The Foundation Library for Young People.' In 1913-15 Mr. Rines was managing editor of 'The German Classics,' and after 1916 was editor-in-chief of the 'Encyclopedia Americana' (2d ed.). This second edition he planned with consummate care, adding many features hitherto foreign to works of reference. His particular care was to have an adequate treatment of every phase of American life and American government and informative articles describing the motives and actions of America in the Great War and the mighty forces loosed by her participation in that conflict.

RING. See RINGS.

RING-BONE, a bony excrescence on the pastern of a horse. It is a morbid growth, callus or exostosis, commonly due to inflammation, and in some cases extending to toe-joints with disabling effect. It is one of the more frequent ailments of horses and, although ordinarily affecting animals of inferior condition or injured by overwork, it sometimes appears in very young colts. While not always visibly impairing the serviceableness of a horse, ring-bone usually depreciates the market value of animals affected with it, and as cure is practically impossible it is a defect which calls for particular preventive methods in the care and breeding of horses and for cautious scrutiny in the purchase of them.

RING AND THE BOOK, The. This is indisputably one of the most remarkable poems of the 19th century. In 21,000 lines of blank verse—such poems as the 'Iliad' and 'Paradise Lost' with their breadth of theme fall far short of this total—Browning unfolds a story centering in a murder actually committed at Rome in 1698. A Tuscan nobleman, nearly 50 years old, slew his young and low-born wife, whom he had wedded for her fortune. The material Browning derived from a miscellaneous collection of documents, legal and other, relating to the trial, partly in print, partly manuscript, bound together in a volume—the so-called 'Yellow Book'—which fell into his hands, probably in 1860. The details, thoroughly assimilated by the poet's imagination, are used in the poem with marvelous fidelity and fullness. The poem already begun in 1862, was published in 1868, and was the first work of its author to receive adequate recognition in the reviews.

The plan is unprecedented and seemingly cumbrous. Owing to Browning's employment of his favorite monologue form, the story is told 11 times. In the monologues we become acquainted with events and actors as transmitted through the personality of each speaker and colored by his prejudices. The interest is maintained, in these repetitions, by extraordinary subtlety, psychological insight and imaginative grasp. The central figure, a triumph of

creative imagination, is the girl-wife, Pompilia. The central interest is her relations with the noble young churchman, Caponsacchi, who rescues her from the tyranny of her husband. Here we have a spiritual romance—love in that purely altruistic form in which it so often appears in Browning's pages as the motive force of the highest life.

In Book I the poet, speaking in person, tells of the finding of the 'Yellow Book'; outlines the story—thus eliminating the element of plot interest; and explains the circumstances in which each of the following monologues is spoken. In Books II-IV, we see the case as it appears to the general public. Two ordinary citizens in gossiping fashion narrate the story,—the first with a bias toward the husband, the second toward the wife. In Book IV, an habitué of the higher circles complacently unfolds, for a politer audience, a more subtle and cynical view. The reader, familiarized with the facts through these partially informed and conflicting statements, is next introduced into the very heart of the action. In Book V Count Guido, the husband, unable to deny the deed, and in peril of his life, sets forth before the judges a cunning and plausible justification; in Book VI, Canon Caponsacchi gives an impassioned narrative of his relations with Pompilia; in Book VII Pompilia, on her death-bed, with infinite pathos, tells her story. The next three monologues—uttered by officials—are on a lower plane. Books VIII, IX contain the pleas of the lawyers, indifferent to the truth, and intent only on displaying their skill in legal quibbling: these books are humorous and satirical, and Browning's penchant for special pleading finds full scope. Book X consists of the meditations of the Pope as in the privacy of his chamber he writes his confirmation of the sentence and orders the execution. The figure of the Pope is a noble and impressive one, and in his discursive meditations he utters much of Browning's favorite philosophy. In Book XI Guido "the same man, another voice, speaks and despairs this last night of his life." Finally the poet himself, in Book XII, by means of extracts from imaginary letters, ties up the loose threads of his tale and concludes with reflections on art.

The style offers few of the difficulties which are supposed to confront the reader of Browning, and the books may be enjoyed separately. As is natural in the case of a work so recent and novel, critical estimates vary. It was a favorite poem with George Meredith, while Carlyle threw off the remark that "it was among the absurdest books ever written by a gifted man." Arthur Symonds writes that "it takes rank easily among the greatest poems." William Sharp considers it, regarded as an artistic whole, "the most magnificent failure in literature." The faults alleged are in the direction of excess. "No one has said that it is too short," remarks Dowden, "many that it is too long." Professor Hereford speaks of its "immense, even riotous vitality," of its being "even mercilessly voluble, but with the volubility of a consummate master of expression, in whose hands the difficult medium of blank verse becomes an instrument of Shakespearean flexibility and compass, easily answering to all the shifts and windings of a prodigal inven-

tion." It is doubtful if any competent critic would now deny that the book is the product of imaginative and intellectual power almost unparalleled—the latter at times unfortunately predominating. Most competent readers will probably assent to Symon's dictum "It has a wealth of spiritual insight, human science, dramatic and intellectual and moral force, a strength and grip, a subtlety, a range and variety of genius and knowledge without parallel save in the pages of Shakespeare."

RING-DOVE, or **CUSHAT**. See **DOVE**; **PIGEON**.

RING-MONEY, in *numismatics*, an ancient metallic currency in the form of rings. This seems to have originated with the Egyptians, with whom rings were freely used as ornaments, and the same rings appear to have answered both purposes. The use of ring-money in Africa subsists to this day. A form of ring-money was also anciently used in Ceylon.

RING-OUZEL, oo'zel, a European thrush (*Turdus torquatus*), rather larger than a black bird and of shy habits, preferring mountain slopes, heaths and wild land to cultivated districts, but it often makes raids on fruit gardens, and in vine countries feeds largely on grapes. In some parts of Scotland it is known as the moor blackbird. The song consists of a few loud, clear and plaintive notes, and is somewhat monotonous. It is dark-brown with grayish wings and has a broad crescentic white gorget, whence the name. See **OUZEL**.

RING PLOVER, or **RINGNECK**, a common plover or dotterel (q.v.) of the whole northern hemisphere (*Ægialitis hiaticula*), distinguished by its black collar and its brilliant, gold-colored eyes. This bird was formerly celebrated in European folk-medicine. To be cured of the jaundice it was held to be only necessary to look fixedly at the bird's eyes with a firm faith in the success of the experiment. See **PLOVER**.

RING SNAKE, the name of various serpents with a band encircling the body, especially at the neck. In the United States the name belongs especially to a small harmless serpent of the warmer States (*Diadophis punctatus*), which is found "coiled up under stones, logs or the bark of fallen trees, chiefly in forests." It is bluish black above, yellowish orange beneath and has a whitish collar. In Great Britain the common grass-snake (q.v.) is often so called; in South America, the many-banded coral-snakes and in South Africa a large black and yellowish venomous hooded snake (*Sepesten hamachates*) known to the Dutch as "ringhals," and differing from the cobras only in anatomical peculiarities. Consult Gadow, 'Amphibia and Reptiles' (1901).

RING-TAILED LEMUR. See LEMUR.

RINGGOLD GAP, Battle of. After the expulsion of the Confederates from Missionary Ridge 25 Nov. 1863 they retreated on Dalton (see CHATTANOOGA, BATTLE OF). To intercept the retreat, General Thomas, on the morning of the 26th, ordered General Hooker to push on Graysville, from near Rossville, and directed General Palmer, commanding 14th corps, to report to Hooker and join in the movement. On reaching Pea Vine Creek Palmer was ordered to move directly on Graysville, while Hooker, with his three divisions—Osterhaus', Geary's and Cruft's—moved on Ringgold to strike the Confederate line of retreat six miles farther south. At 9 P.M. Palmer struck the Confederate rearguard, capturing three guns and some prisoners. Pushing on to Graysville, which was reached at 11 P.M., he captured more prisoners and another gun, and bivouacked for the night. Hooker advanced to within six miles of Ringgold, and late in the night bivouacked a short distance to the right of Palmer. At daybreak of the 27th Hooker renewed the pursuit, Osterhaus' division, in the advance, capturing many prisoners, and pursuing the Confederates into Ringgold. At 3 A.M. of the 27th General Cleburne, whose division was acting as rear-guard to Hardie's corps, received an order from General Bragg to hold Ringgold Gap, in Taylor's Ridge, near the town, until the trains and rear of the retreating troops could get well advanced. Cleburne disposed his four brigades of about 4,200 men on the ridge, on each side of the gap, and as a support two guns in it, and in less than half an hour Hooker came up and Wood's brigade of Osterhaus' division was ordered to attack. Cleburne's skirmishers were soon driven in; but Cleburne, assuming the offensive, attacked Wood's main line and was repulsed, Wood's men following to the gap. Meanwhile Williamson's brigade had made a lodgment on a spur of Taylor's Ridge, half a mile to the left of the gap, but found the Confederates so strongly posted that it could make no headway, and Creighton's brigade of Geary's division was ordered to ascend the ridge still further to the left. Cleburne had anticipated the movement by still farther extending his right. Colonel Creighton, making a gallant assault, was badly repulsed, and in falling back he carried part of Williamson's brigade with him. While Creighton was preparing for another assault he was killed, and operations on that part of the field were suspended. Meanwhile sharp work was going on in the gap and on the line on either side of it, without any material advantage to Hooker. Between 12 and 1 o'clock Hooker's artillery came up and opened a furious fire upon Cleburne's position, but Cleburne had gone, leaving only a few skirmishers in the gap. These were closely followed by some of Geary's men to the bridges beyond the gap. General Grant arrived on the field early in the afternoon, and ordered pursuit discontinued; later in the day Grose's brigade went forward, but encountering cavalry, supported by infantry, it returned to Ringgold. The Union loss at Ringgold Gap was 65 killed and 377 wounded. The Confederate loss, as reported by Cleburne, was 20 killed, 190 wounded and 11 missing. Consult 'Official Records,' Vol.

XXXII (Washington 1889-1901), and Van Horne, 'History of the Army of the Cumberland,' Vol. I (Cincinnati 1875).

E. A. CARMAN.

RINGS. Among primitive races ring adornment of the human members is universal and dates back to prehistoric times. Lip rings (*labrets*), neck rings (*torques*, etc.), nose rings, anklets, bracelets, ear rings were worn by the "savages" of the different countries. The Orientals, from time immemorial, have worn rings on their toes; married women wearing them on the big toe of the left foot, men wearing them on the big, second and third toes. The finger ring, strange to say, does not figure among the aboriginal adornments of the wild or savage tribes (America, Africa, etc.). The finger ring appears to have originated with the early Egyptians, and was evolved from the seal or signet (about 16 centuries before our era). The intaglio seal affording security and authenticity of ownership was probably carried strung on a cord until the invention of fastening it in a stirrup-shaped loop. A hole was bored longitudinally and wire passing through this entered holes in the extremities of the loop (see Figs. 1, 2) to be fastened by winding round the latter. Fine specimens of goldsmiths' work in this form are in the Louvre and London museums. The seal being sign of power or authority, it was natural that the wearer of the portable seal (a signet ring) assumed dignity. In this sense Pharaoh (Gen. xli, 42) invested Joseph with his ring; a ring in the Ashburnham collection, it is claimed, may be this very one (see Fig. 3) as it was found in a mummy case (in the Necropolis of Sakkarah, near Memphis) having hieroglyphics indicating that it contained the body of Joseph. The step from the ring being insignia of authority to its becoming an article of adornment is a short one, and we find the Egyptian ladies wore finger rings, even several on a single finger; a number of elegant specimens are extant (see Fig. 4). Herodotus (5th century B.C.) tells the story of the ring of Polycrates, tyrant of Samos. Warned that the great wealth and marvelous successes would bring dire visitations from his enemies in later life if he did not make some great sacrifice to the gods to forefend disaster, he threw his most valued possession, a talismanic ring, into the sea. His cook found it in the belly of a fish and returned it to him. The Greeks, Etruscans and Romans produced lovely finger-rings (see Figs. 5-7). One quite peculiar form of Roman ring has a key attached to it, some specimens have numerous wards and even the hollow *barrel* (see Fig. 8) of modern keys. Roman rings are in many decorative forms (see Fig. 9), the betrothal ring (*anulus pronubus*) being composed of two rings having oval plates containing the engraved names of the betrothed couple (see Fig. 10). Like the rings of the Spartans, the betrothal ring was made of iron, till Pliny's time. But we have Roman rings made in double, triple, even quintuple form; such were termed *polysephi*. Mythology records a ring dating back far beyond those above mentioned, for it informs us that, when Jupiter released Prometheus from his agonies on the Caucasian rock, he had to wear on his finger one of the links of his iron chain with a piece of the rock

set in it as reminder of his terrible experience. The first Roman senators wore rings of iron, but when acting as ambassadors a gold one was given them; later they could all wear gold rings. Next the privilege of wearing a gold ring became so common even the menials wore them and only slaves wore iron rings. When Hannibal's soldiers took the gold rings from the Roman dead after the battle of Cannæ (216 B.C.) they filled, some writers say, three bushel baskets. During the Roman Empire it was a custom to give birthday (anniversary) rings, termed *anuli natalitii*. The imperial signet of Constantius (306 A.D.) is in the Rinuccini cabinet at Florence with its 53-carat sapphire engraved with the scene of the emperor spearing a wild boar, etc. Of Anglo-Saxon rings the British Museum (London) contains that of King Ethelwulf (see Fig. 11) and that of Ethelswith, his daughter, queen of Mercia, of the 9th century. Other extant rings of historic interest are: The "Shakespeare ring" (see Fig. 12) supposed to have been given by Anne Hathaway to the poet, which was found in a field at Stratford-on-Avon; the ring said to have been given to Henry Darnley (her spouse) by Mary Queen of Scots (see Fig. 13); the wedding ring Martin Luther gave to Catherine Bora when he made her his wife (see Fig. 14), it is what is known as a "Passion" ring, carrying the symbols of the Passion. The wedding ring of the Romans was a signet ring and conveyed the meaning that it was the wife's right to seal up the property of the household; it, sometimes, had a small key attached. It was placed on the fourth finger in early Roman days; the index finger was regarded by the Jews as the hallowed finger and bore the marriage ring; in the days of "Queen Bess" of England the ring, after betrothal, was worn on the thumb. The betrothal ring in Britain became the wedding ring about the time of the Reformation.

Ecclesiastical Rings.—Closely allied to the wedding ring is the ecclesiastical ring, ceremonially wedding the wearer to the Church, as well as signifying the dignity of the office. Most important of these insignia jewels is the papal ring, called the "Fisherman's Ring" (or *anulus piscatoris*), with its gem stone containing an engraving (used by the Pope for his seal) of Saint Peter in a bark pulling up a fishing net and the Pope's name above. A new one is conferred by the cardinal-chamberlain, to be broken on the death of the Pontiff. *Episcopal* rings conferred on bishops and abbots are of gold embellished by a stone; the latter must not be cut (as is the papal ring) but left in its natural form (see Fig. 15), though polished. The stone was formerly green (emerald favored), later blue (sapphire), but Dr. Kunz says: "Besides rubies and emeralds, balas-rubies, turquoises, chalcedonies and even opals were used, pearls and garnets also appear occasionally." The *episcopal* ceremonial ring is worn by the bishop outside his glove, and is, therefore, quite a large ring. An amethyst, emblematic of sincerity, innocence and earthly suffering is worn in the rings of cardinals and bishops as a sign of submission to the Church as well as of spiritual power. *Decade* rings came into being in the 14th century and are so termed from the fact that they have 10 projections on their circumference.

They answer the purpose of a rosary (see Fig. 16) and each knob represents an *Ave*, while the head or bezel (often with I.H.S. and the three nails) represents the *Pater Noster*. Peculiar to England and Scotland are the so-called *iconographic* rings, with their Virgin Mary and Child, or saints' images, in gold or silver. They were made from 1390 to 1520. The Jewish ceremonial wedding ring is frequently a very large and cumbersome device with its bezel towering into the architecture of houses (see Fig. 17) and with raised filigree ornamental circlet. A very noted ceremonial ring is the English "Coronation" ring; it is of pure gold and large, being worn over the glove, generally on the index finger of the right hand formerly, except on celebrating Mass, when it is changed to the annular finger. Usually it has a large violet-hued table-cut ruby, and a Saint George's cross is engraved on the flat surface; 26 diamonds surround the ruby.

Memorial Rings.—In olden times it was the custom to bequeath *memorial* rings to one's friends, as is shown in many wills. Richard II (1400) left a gold ring to each of his nine executors. Shakespeare (1616) bequeathed rings to a number of friends. Samuel Pepys willed 123 memorial rings to surviving friends. Followers of Charles I, after his execution, wore memorial rings, some with his effigy or name on them, and it established a custom that lasted for many years. Black enamel or niello was favored for memorial rings, but in the 18th century young maidens' deaths were memorialized with rings in white enamel. Hair from the head of deceased, in the end of the 18th century, was used in forming a device in the bezel. Later very plain rings came into vogue with just a motto, as: "To the Memory of" Other mottos seen are: "Not lost but gone before," "Memento Mori," etc. But the "Memento Mori" rings so-called are those bearing a death's head. Extant are rings with the letters BDLK, they stand in memory of executed lords Balmerino, Derwentwater, Lovat and Kilmarnock.

Occult Rings.—The fact that, in mediæval days, certain peculiar-shaped pieces of stone, metal, ore, etc., were considered to have occult powers of great value led to the setting such talismans in finger-rings to obtain security and portability. Cabalistic words or sentences also served for occult influences and we find them on rings (see Figs. 18-20); astrological signs of significance are frequently found on such talismanic rings. Great curative power was supposed to be possessed by certain mystic rings carried by physicians of olden times, they are known as *medicinal* rings; Galen (about 200 A.D.) was renowned as a doctor and tells of a green jasper amulet of King Nechepsus, of Egypt, that had a design cut in it representing a dragon surrounded by rays. He said it was a most potent remedial agent for the digestive organs. To be numbered among the *medicinal* rings are the "royal cramp rings." Edward the Confessor, king of England (1042-66) instituted the practice, according to the legend, from the fact that, he being without money, one day when an aged pilgrim accosted him, the royal personage handed over a ring as alms. The pilgrim turned out to be no other than the Apostle Saint John in disguise, who sent the ring

back to the king with the information that he had blessed the ring and it now had great curative power. Since which time, up to the reign of Queen Mary, the English kings and queens had *blessed* and distributed a number of rings on Good Friday which were said to be a sure cure for "falling sickness" (epilepsy) and were termed "cramp rings." The antithesis of medicinal were *poison rings*. The Borgias are said to have used rings containing poison, which, by pressing the victim's hand, pricked and poisoned with deadly effect. Such rings dating from that period are in existence; the poison (liquid) was hidden in a small cavity in the bezel. In ancient times it appears to have been a frequent custom to wear a ring containing a deadly poison with which to escape from torture if taken prisoner. Hannibal took a fatal dose of poison from his ring when he was to be given over to his enemies, the Romans. "Posey rings" were a mediæval invention and contained inscribed love mottoes. The word is frequently spelled *posie* and *poesie*; originally they were called "chanisons" or "reasons." The earlier specimens have the couplets engraved on the outside, but later (by the 16th century) they were hidden in the inside where only the wearers could see them. On them we find such expressions as: "Many are the starres I see, Yet in my eye no starre like thee," "No love so hard as love debarred," "My life is done when thou art gone."

La Semaine rings of France came into vogue in the 19th century, and carried seven stones, the name of each commencing with the same letter as the day of the week.

Gimmel rings (spelled also *gimmel*, *gemmel*, *gemmow*, etc.) were old style matrimonial rings composed of twin loops (see Fig. 21) that linked into each other. While generally double we find them made in triplets, or even further complicated. Herrick writes: "Thou sent'st to me a true-love knot, but I return a ring of jimmels, to imply thy love had one knot, make mine a triple tie." The device of the noted Cosimo di Medici consisted of three diamond rings entwined (see Fig. 22); they recall the fact that at an early date diamonds were set in rings, before the method of cutting them was discovered, with the natural conical point of the crystal extending from the bezel. These points were used by the ladies and gentry to cut love couplets and other inscriptions on glass windows, etc.

Hololith rings, Dr. Kunz tells us, are those made entirely of a single piece of stone. Perhaps the most costly of these is that emanating from the Mogul Empire (16th century) and made for Jehangir Shah. It is cut out of a single emerald "of exceptional purity and beauty of color." More frequent are rings made solely of amber, rock-crystal, chalcedony, carnelian, jade, coral, steatite, ivory, etc.

Fisherman's Ring' (in *Archæologia*, London 1866); Neville, R. C., 'The Romance of the Ring' (Saffron Walden 1856).

CLEMENT W. COUMBE,
Technical Art Expert.

RINGWORM, a disease occurring in three varieties, in one of which it attacks the scalp, in another the beard and in the third some part of the body. In all cases it is due to the presence of a vegetable parasite, consisting of minute round bodies, and of thread-like structures formed of rows of rod-shaped bodies of a beaded appearance. This is the growing fungus (*Trichophyton tonsurans*) and its spores, and wherever ringworm occurs this is present between the layers of cells of the scarf-skin, in hairs and hair-sheaths. Ringworm of the body (*Tinea circinata*) is the name given to the disease when it occurs on non-hairy parts of the body. It is most common on the face, neck and trunk, but it also occurs on the hands, arms and wrists. It consists of small circular patches, rose-colored and slightly raised, covered with small branny scales. Usually round the margin is a ring of very small blisters. The spot is the seat of a tingling and itching sensation. It spreads around the margins, and as it spreads the centre heals up, so that a large red ring with a pale centre is formed. Ringworm of the scalp (*Tinea tonsurans*), identical with favus (*Tinea favosa*), begins with small red patches like those described above and spreads at the margins. It involves the hairs, which become penetrated by the fungus, and are dry, dull and twisted. They are easily pulled out and become very brittle. The affected patch becomes covered with a grayish-white powder. Inflammation may be produced and crusts formed. This variety of ringworm is commonest in children. Ringworm of the beard (*Tinea sycosis*) is similar to the scalp variety. A lotion of bichloride of mercury is often sufficient to kill the fungus, but if it prove ineffectual glacial acetic acid may be painted all round the spreading margins of the ring. In ringworm of the head and beard the hair of the diseased patches and for a little distance beyond should be cut short, and crusts should be removed by poulticing, washing with water and soft soap, etc. The general health should be maintained by the use of tonics and otherwise. Ringworm is very contagious.

RINK, Hinrich Johannes, Danish Arctic explorer: b. Copenhagen, 26 Aug. 1819; d. Christiania, Norway, 15 Dec. 1893. He took his Ph.D. at Kiel in 1844, and in 1845-47 was mineralogist to the *Galatea* expedition around the world. In 1848-51 he was engaged in explorations of northern Greenland, and his subsequent life was devoted to the affairs of that country. He was inspector of southern Greenland in 1857-71; and in 1871-82 he was director of Greenland's trade in Copenhagen. He afterward lived in Christiania. Author of 'Die Nikobarischen Inseln' (1847); 'Grönländ geographisk og statistisk beskrevet' (2 vols., 1852-57; Eng. trans., 'Danish Greenland,' 1877); 'Eskimoiske Eventyr og Sagn' (1866; Eng. trans., 1879); 'The Eskimo Tribes' (1887); 'Grönländere og Danske i Gröland' (1887), etc.

RIO BRANCO, *rê'ô brâng'kô*, a large river of Brazil, entirely in the state of Amazonas. It rises on the eastern slopes of the Serra Parima, near the sources of the Orinoco, flows

eastward parallel to the Serra de Pacaraimo, turns southward before reaching British Guiana, and joins the Rio Negro about lat. $1^{\circ} 25' S.$, long. $61^{\circ} 10' W.$ It has a length of about 830 miles and receives numerous affluents.

RIO CUARTO, koo-är'tō, Argentina, a town of Córdoba province, near the source of the Cuarto River, on the Trans-Andean Railroad midway between Belleville and Villa Mercedes, 119 miles south of Córdoba. It is the distributing centre of a large agricultural region. Pop. about 25,000.

RIO GRANDE, rê'ō grān'd-ā, or **RIO GRANDE DEL NORTE**, a river which rises in the southwestern part of Colorado, flows south and southeast into New Mexico, when its general course, about half-way across the Territory, is south by west, then south by east to El Paso (q.v.), whence it forms the irregular boundary between Texas and Mexico. It enters the Gulf of Mexico after a course of nearly 1,900 miles. It is navigable for small boats only to Kingsbury Rapids, near Presidio, about 460 miles from its mouth. In the upper course the banks are generally high, and the irregular rocky beds form rapids and waterfalls. In the lower part of its course the stream is shallow, and it is subject to periodical inundations. The largest tributary is the Pecos River, which enters the Rio Grande from Texas. A number of United States forts are on this river. The most important places on the Rio Grande are Brownsville, Eagle Pass, Laredo and El Paso in Texas; and Matamoros and Nuevo Laredo in Mexico. A few villages and towns of importance are on the banks of the river in New Mexico.

RIO GRANDE DE CAGAYÁN, rê'ō grān'dā dā kā-gā-yān', the largest river of the island of Luzon, Philippines. It rises on the northeastern slope of Carabellos Sur, and flows north in a winding course to the China Sea. It drains a large territory, and has numerous tributaries, the chief of which are the Magat and the Chico de Cagayán. Its valley is very fertile, the land being used mainly for the cultivation of tobacco. The river is navigable for vessels drawing 12 feet as far as Lalló, 13 miles from its mouth; and for light draft vessels for 200 miles in the wet season. Freshets occur at times with a rise of several feet in a few hours.

RIO GRANDE COLLEGE, located at Rio Grande, Ohio; founded in 1876 under the auspices of the Free Baptists. It offers a classical and a scientific course, and confers the degrees of bachelor of arts and bachelor of science. There is also a preparatory department. The college is coeducational, and women constitute fully one-half of the student body. The grounds and buildings in 1910 were valued at \$40,000; the library contained 3,500 volumes; the productive funds amounted to \$76,000; and the annual income to \$6,000. The students in collegiate department, the preparatory, normal, music, elocution departments and the summer school numbered about 400 in 1916.

RIO GRANDE DE MINDANAO, rê'ō grān'dā dā mēn-dā-now'. See MINDANAO, GRANDE DE.

RIO GRANDE DO NORTE, rê'ō grān'dā dō nōr'tā, an important maritime state in the northeast of Brazil; area, 22,196 square miles.

The surface is mountainous in the south and southwest, where it is covered by several mountain ranges. The principal rivers have all either a north or an east direction. The proximity to the equator makes the climate intensely hot. It is, however, not unhealthy. The soil is generally good, but not remarkable for its fertility. For a long time sugar cane was the principal cultivated crop, but considerable tracts formerly devoted to it are now occupied by cotton, which may be regarded as the staple product of the province. The other leading crops are mandioca (cassava), millet and haricots (kidney beans). Many of the plains are grazed by large herds of horses and cattle. The minerals include gold, silver, iron, salt, amethysts and rock-crystals, limestone, sandstone and granite. The forests are not very extensive. Pop. 430,000.

RIO GRANDE DE LA PAMPANGA, rê'ō grān'dā dā lā pām-pān'gā. See PAMPANGA, RIO GRANDE DE LA.

RIO GRANDE DO SUL, rê'ō grān'dā dō sool, a southern maritime state and the best known of all the states of Brazil; area, 91,336 square miles. Along the coast for more than half the extent of the coast-line of this state stretches the great Lago dos Patos, which communicates with Lake Mirim, and which receives the rivers of the southeastern part of the territory. Those to the southwest belong to the basins of the Paraná and Uruguay, and flow west. The mountain chain called Serra Geral divides the state into two unequal parts. The sea-coast is flat and sandy, and is lined by a series of reefs, which make navigation dangerous. The interior, partly occupied by arid serras, is mostly fertile. The climate is temperate, and the productions are more like those of Europe than of the rest of Brazil. Maize, rice, potatoes, mandioca, black beans and flax, particularly the first, are largely cultivated. The finer European fruits, especially figs and peaches, find a genial soil. The minerals of the state include gold, iron, sulphur and porcelain clay of the finest quality. There is a large foreign population in Rio Grande do Sul composed principally of Italians, Germans, Portuguese, Spanish and Spanish-Americans, with a few English, Americans and Belgians. The Germans number over 200,000 and the Italians even more. The chief occupation of the inhabitants is the rearing of cattle, horses and mules, and the preparation of dried beef. A number of German colonists and many Italians have settled in the state. There are several railways. Porto Alegre, about 100,000, is the capital. Pop. of the state 897,455. See BRAZIL.

RIO DE JANEIRO, rê'ō dā zhā-nā'rō, Brazil, one of the maritime states on the southeast coast of the republic; area, according to official returns, 26,634 square miles. The central part of this territory is mountainous, being traversed generally from east to west by a series of ranges, of which the loftiest and most conspicuous is the Serra dos Órgãos or Organ Mountains (q.v.). They are almost entirely composed of granite. The mountains slope down on the north and south—in the former direction toward the basin of the Parahyba, to which all the surface of the province on that side belongs; and in the latter to the coast, which

receives the drainage from a great number of comparatively small streams, each carrying its waters directly to the ocean. The shore toward the northeast is lined by numerous lakes and lagoons. The soil does not seem to possess much natural fertility. A great part of it consists of a retentive clay, ill-adapted for agricultural operations; but the warmth and moisture of the climate are so favorable to vegetation that magnificent forests and valuable crops exist, and there are many tracts of the richest land which are turned to the best account. The crop which attracts the largest share of attention is coffee. The other leading crops are sugar, rice, millet, mandioca and cotton. The forests are rich in timber, both for ordinary and ornamental purposes, in dye-woods, gums, balsams and valuable medicines. The domestic animals, originally imported from Europe, have increased considerably, and immense herds of cattle are reared. This province is not rich in precious metals. Iron, however, abounds, though it is not much worked; and the decomposition of granite has formed extensive beds of the finest kaolin. The state assembly used to meet at Niteroy, but Petropolis is the present capital. Under separate jurisdiction from the state is the federal district of Rio de Janeiro, embracing the city of the same name (q.v.) and its surroundings. The population of the state exclusive of the federal district is 1,250,000.

RIO DE JANEIRO, capital of the United States of Brazil; socially and commercially the most important city of South America, excepting Buenos Aires. It is situated in the federal district which comprises 538 square miles. The name is supposed to perpetuate an error of the discoverers (1 Jan. 1502), who, seeing the great length of the bay, assumed that it was the mouth of a river (*rio*). It is, in fact, a capacious and excellent natural harbor, one of the largest in the world, with an area 68 square miles greater than the combined areas of the lower and upper bays of New York. It is 17 miles long, 15 miles wide and has 45 miles of coast line. But the bottom silted up so much in recent years that the water near the shores became too shallow for large vessels. Accordingly, some of the old mooring places were abandoned. Merchant vessels unable to reach the docks cast anchor on the north side of the city, and their cargoes were transported in lighters. The entrance to the bay is less than a mile wide and is sheltered by high mountainous elevations. Modern facilities for handling freights were provided for in 1904; and the plans for the improvement were drawn by a commission of Brazilian engineers. A wide quay of solid masonry extends along the northern front to a deep artificial channel. The outer wall of this quay for about two miles is accessible to the largest shipping, and railway trains run to the same point. The new quays are very extensive and are equipped with cranes, warehouses, railway track and all the facilities of a modern harbor. The harbor has been drained to such a depth that ocean-going vessels can load and unload without the aid of lighters, which not long ago formed such an important feature of the harbor. The city proper is very compactly built on flat land adjoining the bay, but its suburbs stretch out along

the shores for miles. Above the crowded central portion rises Sugar Loaf Peak (*Pão d'Assucar*), and on the same side of the harbor is the fortress called *São João*—opposite which, on the eastern promontory, is *Santa Cruz* fortress. A small island, lying in the entrance between *São João* and *Santa Cruz*, is also fortified; and other defensive works are located in the bay on an island, which takes its name from the French adventurer Villegaignon, who tried to establish a colony of Huguenots there (1555-60). The main body of the city is divided into regular squares by narrow streets, along which pass lines of electric cars. The National Museum, formerly the Imperial Palace of *Boa Vista*, is in the district of *São Christovão*. Some of the finest buildings, the Senate, City Hall, Mint, Normal School and Quartel-general, surround the old park, *Praça 15 de Novembro*, now called *Campo de Sant' Anna*. The Department of Foreign Relations occupies the old palace of *Itamaraty*. The present government palace was formerly the luxurious residence of *Conde de São Clemente*. The Chamber of Deputies, Department of Telegraphs and Historical Institute are installed in the old *Poço Palace*. A fine modern building is devoted to the Department of Industry. An especially interesting feature of the city is the Botanical Garden, in which rare exotics from all countries of the globe are cultivated, side by side with specimens of the flora of the various parts of South America. The cathedral and church of *Santa Cruz* stand near the water front, in a large square from which starts the main business street, *Primeiro de Março*. Rio de Janeiro is the chief industrial and commercial centre of Brazil. The very large wholesale and foreign trade of the city is largely in the hands of Portuguese, Brazilian, English, German and French merchants. In the list of exports, coffee is the principal item. Imports consist chiefly of food products and manufactured articles. There are at Rio cotton mills, furniture manufactories, flour mills, textile factories other than cotton, shirt, shoe, collar and stocking factories, hydrogen gas plant, railway car works, lumber mills, breweries, distilleries, canned food factories of various kinds, chemical works and a long list of other industries, over 600, covering most human activities, foundries, dry docks and a naval arsenal. A system of railways, of which the capital is the centre, covers the state and the southern part of *Minas Geraes*. The "Brazil Central" system, the most important in the republic, connects Rio with *São Paulo*, and has a large number of branch lines, controlling the terminal facilities of the port and the suburban traffic. Rio de Janeiro is the principal market for the coast trade in fish; and it receives from 35 to 40 per cent of the country's imports, while one-fifth of all Brazilian coffee passed through its port. Population of the city about 1,000,000.

RIO NEGRO, *rê'ô nã'grô* ("black river"), the name of numerous streams, of which two are important: (1) A river of South America and principal tributary of the Amazon. It rises in Colombia and joins the Amazon, after a course of about 1,000 miles, at *Manáos*, Brazil. The Rio Negro together with the *Naupés* is between 1,400 and 1,500 miles in length. Through

its affluent, the Cassiquiari, there is direct communication between the Amazon and Orinoco. Ocean steamers ascend the river to Manáos, the chief shipping point for the rubber collected in the interior far up the river. (2) A river of South America forming the boundary between the Argentine Republic and Patagonia. It rises in the Andes in Chile and is over 700 miles long. Its current is very rapid and its bed obstructed with shoals and sand banks. It is navigable, under some difficulties, for nearly 600 miles.

RIO DE LA PLATA, *rě'ō dā lā plā'tā*. See PLATA, RIO DE LA.

RIO TÉODORE, or **THEODORO**, formerly known as **RIO DUVIDA** (River of Doubt), a river of Brazil, rising in the Corde heira dos Parecis, in the western portion of Matto Grosso, flowing in a northerly direction from about the 13° to the 5° of lat. S., and between the 59° and 60° of long. W., and emptying into the Maderia, an affluent of the Amazon. It is the largest affluent of the Maderia, about equal in size to the Hudson, with many rapids and falls. Its length is nearly 1,000 miles. The lower course of the river had long been known to the rubbermen, but the upper course, traversing an unexplored portion of western Matto Grosso, was entirely unknown, and no part of the river was recorded on the maps. When the Roosevelt-Rondon expedition was starting on its exploring trip through southern and western Brazil in 1914 Colonel Roosevelt was approached by the Brazilian Minister of Foreign Affairs, Mr. Lauro Müller. Mr. Müller was intensely interested in the development of the interior of Brazil, and asked Colonel Roosevelt to undertake the exploration of the Rio Duvida, of whose source or course nothing was known beyond its lower waters. The announcement of the exploration of a hitherto untraversed and unmapped river caused considerable comment and even doubt upon Colonel Roosevelt's return in the autumn of 1914, but he established the course and identity of the new river without difficulty. It was at first christened Rio Roosevelt, but later was formerly designated as Rio Teodoro by the Brazilian government. Consult Roosevelt, T., 'Through the Brazilian Wilderness' (1914).

RIOBAMBA, *rě-ō-bām'bā*, or **BOLIVAR**, Ecuador, a town on the Pastasa River, a branch of the Amazon, about 100 miles from Quito. A former town of the same name, at the foot of Chimborazo Mountain, about nine miles from the present town, was destroyed by an earthquake in 1797. Riobamba, which is the capital of the province of Chimborazo, has a population of about 25,000, most of them Indians.

RIOJA, Francisco de, *frān-thēs'kō dā rě-ō'hā*, Spanish lyric poet: b. Seville, about 1583; d. Madrid, 8 Aug. 1659. He studied first law and then theology in his native city. The minister Olivarez obtained for him a prebend in the cathedral of Seville, and he became royal historiographer, inquisitor at Seville and, lastly, inquisitor of the supreme tribunal of the holy office. The downfall of his patron involved his own. He was imprisoned and obtained his liberty only after he had undergone a formal trial and completely established his innocence.

Philip IV, whose favor he had regained, made him director of the royal library and councillor in the Supreme Court of the Inquisition. As a poet he formed himself on the classic and Italian models, particularly Horace and Seneca; kept himself, in style and language, free from the tasteless eccentricities of his contemporaries, and thus preserved the true spirit of the lyric. His 'Silvas' exhibit rich pictures of rural life, remarkable for their truth to nature. His works were published with a biography by D. Cayetano de la Barrera, 'Poesias' (1868); and 'Adiciones a las poesias de D. Francisco de Rioja' (1872). Consult Longfellow, 'Poets and Poetry of Europe' (1843).

RIOJA, La, Argentina, a western province north of San Juan and south of Catamarca, with an area of 69,502 square miles, divided into 18 departments. While in the east and south there are salt and sand deserts, it is well watered on the west, and agriculture and cattle rearing are important industries. Excellent wheat, fruits and wine are produced. The climate is dry and healthful. Near Chilecito and Famatina are valuable gold, silver and copper mines, and the province contains gypsum, salt, graphite and coal. Pop. about 110,000. The capital of the province is La Rioja, a town of 10,000 inhabitants at the foot of Mount Belasco, 118 miles southwest of Catamarca, with which it is connected by railway and public highway. It contains a state college and a normal school.

RION, *rě-ōn'*, or **RIONI**, *rě-ō'ně*, the ancient **PHASIS**, a river of Colchis (Transcaucasia, Asiatic Russia), anciently regarded as the boundary between Europe and Asia. It was afterward held as the boundary line between Colchis and Asia Minor. It rises in a spur of the Caucasus (Moschici), and after receiving the rivers anciently called the Rhion, the Glaucus and the Hippus, it falls into the Euxine near the ancient town of Phasis. In the early part of its course it was called the Boas. Other rivers were sometimes confounded by ancient writers under the same name with this. The Phasis of Xenophon was the Araxes.

RIORDAN, *rě'ōr-dān*, Patrick William, American Roman Catholic archbishop: b. New Brunswick, 27 Aug. 1841. He was educated at Notre Dame, Ind., and was graduated from Louvain, Belgium, in 1864. He then returned to Chicago, accepted the chair of theology at the Seminary of Saint Mary's of the Lake, and in 1868-71 was pastor of Saint Mary's Church at Joliet, Ill. From 1871-83 he was in charge of Saint James' Church, Chicago, and in the latter year was consecrated titular archbishop of Cadesa and was made coadjutor. He succeeded to the see of San Francisco in 1884.

RIORDAN, Roger, American artist and author: b. Ireland, 1848; d. 1904. He studied art at the Art Students' League in New York, contributed as illustrator and writer on art subjects to various magazines and served on the international jury of awards at the Paris Exposition, 1900. He published 'Sunrise Stories, a Glance at the Literature of Japan'; 'French Etchers' and collaborated on the catalogue of the Marquand collection.

RIOT (O. F. *riot*, *ryote*), a disturbance of the public peace, attended with circumstances of tumult and commotion, as where an assem-

bly destroys, or in any manner damages, seizes or invades private or public property, or does any injury whatever by actual or threatened violence to the persons of individuals. By the common law a riot is an unlawful assembly of three or more persons which has actually begun to execute the common purpose for which it assembled by a breach of the peace, and to the terror of the public. A lawful assembly may become a riot if the persons assembled form and proceed to execute an unlawful purpose to the terror of the people, though they had not that purpose when they assembled. In England every person convicted of riot is liable to be sentenced to hard labor. In Scotch law rioting is termed mobbing. A person may be guilty of mobbing who directs or excites a mob, though he is not actually present in it. Mere presence without participation may constitute mobbing. A majority of the States of the American Union have riot acts somewhat similar to those of England, and the common law governs where no statutes have been enacted. A riot against the government with the purpose of overthrowing it is treason. However, an uprising of this kind is not generally called a riot.

RIOUW-LINGGA, rē'ow lin'gā, or **RIOU**, or **RIO LINGA**, an archipelago southeast of the Malay Peninsula, belonging partially to the Netherlands. It is formed of two groups of islands; the northern group is that of Riouw, and the southern, Lingga. There are about 30 islands in the Riouw group; the largest, Bintang, has an area of 400 square miles. Lingga, of the Lingga group, has an area of 320 square miles; Singkep, 204 square miles. The soil of the greater part of the archipelago is fertile and the whole is well wooded. The principal export is gambir; other exports are pepper, sago and rice. Tin has been mined and exported for many years. The original inhabitants have nearly all disappeared. The capital of the Dutch residency is Rio (Riouw). The population now is made up of Chinese, Japanese, Javanese and Kings. Pop. about 80,000.

RIP VAN WINKLE, rip van wing'kl, a character in one of Washington Irving's legends of the Hudson Valley. While hunting among the mountains he falls in with the reputed followers of Hendrik Hudson and by drinking the liquor they offer him is cast into a sleep of 20 years. When he awakes and returns to the village of Laughing Water, he finds all things changed, but is chiefly relieved to discover that his wife, the irritating obstacle to his easy-going life, is no longer alive. The story was dramatized by Joseph Jefferson (q.v.) and formed one of the important rôles in his repertory. This version of the play was first performed in London in 1865.

RIPARIAN RIGHTS are those of one who owns the land bounding upon a water-course; such owner is the proprietor of that portion of the bed of a river which adjoins his land; such rights upon navigable waters depend largely upon statute and customs of the different jurisdictions. A riparian owner has the right of access to navigable water, and for that purpose to erect a wharf or pier, provided it does not encroach upon the navigable waters sufficiently to interfere therewith. A riparian owner has also a right to the accretions of the

soil and to fish in the adjacent waters; he has also the right to have the stream flow naturally without changing it in quantity or otherwise. Such owner is not entitled to the water, but merely to its use, and is without the right to divert, obstruct or corrupt the stream, except to build such lawful obstructions as may be necessary for bridges, wharves and dams. Riparian rights of property are established property, of which the owner cannot be deprived except by due process of law. See **RIVERS**.

RIPLEY, rip'li, **Eleazar Wheelock**, American soldier: b. Hanover, N. H., 15 April 1782; d. West Feliciana, La., 2 March 1839. He was graduated from Dartmouth College in 1800, engaged in law practice and in 1811 settled at Portland, Me. In 1810-11 he was a member of the Massachusetts legislature, served as speaker in the latter year and in 1812 was elected State senator. At the outbreak of the War of 1812 he entered the army, became brigadier-general in 1814, and for services at Niagara, Chippewa and Erie was voted a gold medal by Congress. He remained in the army until 1820 when he removed to Louisiana and resumed the practice of law. He afterward served in the State senate and was a member of Congress from 1835 until his death.

RIPLEY, George, American author: b. Greenfield, Mass., 3 Oct. 1802; d. New York, 4 July 1880. He was graduated at Harvard in 1823, studied theology at Cambridge and in 1826 was ordained a Unitarian minister in Boston. He became interested in the principles of Fourier, Comte and St. Simon and made translations of the writings of modern German and French philosophers and endeavored to introduce their ideas in America. He collaborated with Dr. Hodge on a large work in 14 volumes, 'Specimens of Foreign Standard Literature' (1838-42). His 'Discourses on the Philosophy of Religion' (1839) gave rise to a long and bitter controversy with Prof. Andrews Norton of Cambridge. He was a leader in the Transcendental Movement originating in 1836 in association with Emerson and others, and wrote frequently for *The Dial*, the organ of that movement. In 1841 he definitely retired from the ministry and became prime mover in the communistic enterprise of Brook Farm (q.v.), and in 1844 invested all his small fortune in that settlement in West Roxbury. After the burning of the phalanstery in 1846 and the consequent dispersion of the colony, he went to New York as literary editor of the *Tribune*; contributed also to the literary department of *Harper's Monthly*. With Bayard Taylor he edited a 'Handbook of Literature and Fine Arts' (1852), and in 1858, with Charles A. Dana (q.v.), began the editing of 'Appleton's New American Cyclopaedia.' Consult Frothingham, 'George Ripley' (1882); Swift, 'Brook Farm' (1900).

RIPLEY, James Wolfe, American soldier: b. Windham, Conn., 10 Dec. 1794; d. Hartford, Conn., 16 March 1870. He was graduated at West Point in 1814, served in the second war with Great Britain, his first engagement being in the defense of Sackett's Harbor. In 1818 he was promoted lieutenant, fought in the Seminole War and was appointed commissioner to establish the boundary line of the Florida reservation in 1823-24. He was captain in command

of Charleston Harbor at the time of the nullification troubles in 1832-33, and in 1841-54 was superintendent of the Springfield armory. He was brevetted lieutenant-colonel in 1848 for services in the Mexican War, receiving full rank in 1854. He was promoted brigadier-general in 1861, and after 1863 was inspector of fortifications on the coast of New England. He was brevetted major-general in 1865.

RIPLEY, William Zebina, economist: b. at Medford, Mass., 13 Oct. 1867. He graduated at the Massachusetts Institute of Technology in 1890; A.M., 1892, and Ph.D. 1893 at Columbia University; and was professor of economics, Massachusetts Institute of Technology 1895-1901; lecturer on sociology, Columbia University 1893-1901; and from 1901, professor of economics at Harvard. In 1900-01 he was expert agent on transportation, United States Industrial Commission; Huxley Memorial lecturer, Royal Anthropological Institute, London, England, 1908; and lecturer at Columbia University 1915-16. He is author of 'Financial History of Virginia' (1890); 'The Races of Europe' (Lowell Institute lectures, 1900); 'Trusts, Pools and Corporations' (1905); 'Railway Problems' (1907); 'Railroads: Rates and Regulation' (1912); 'Railroads: Finance and Organization' (1914). Editor of selections and documents in economics (8 vols.); also many articles in periodicals.

RIPLEY, Ohio, village in Brown County, on the Ohio River, and on the Chesapeake and Ohio Railroad, 45 miles southeast of Cincinnati. It was founded about the time of the War of 1812, and was first called Staunton; later its name was changed in honor of General Ripley, an officer in the war. For a time the County Courts were held here, but the county-seat was finally moved to Georgetown. The first station on the "underground railway" for runaway slaves was located in Ripley. It is in a noted tobacco region and has a number of tobacco packing-houses and factories; its other industrial establishments include a piano factory and shoe factories and it carries on a considerable river trade. Pop. 1,840.

RIPON, rip'ón, England, a cathedral city in the county of York (West Riding), on the Ure, 22 miles by rail northwest of York. The cathedral of Saints Peter and Wilfrid, dating as far back as the 12th century and restored 1862-76, is one of the finest churches in England; length, east to west, 266 feet; width of transept, 132 feet; the three towers 120 feet high were crowned by spires prior to 1660. The abbey of Ripon was founded in the 7th century, and the Saxon crypt of the cathedral was probably built by Wilfrid in 674-678. The see of Ripon was established in 1836. The city has also other fine ecclesiastical, municipal and benevolent institutions. The principal manufactures are machinery, saddle-trees, leather and varnish. An obelisk 90 feet high is situated in the centre of the market place. Pop. about 8,250.

RIPON, Wis., city in Fond du Lac County, on Silver Creek, an inlet of Green Bay, and on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads, about 85 miles northwest of Milwaukee and 18 miles west by north of Fond du Lac.

Ripon was settled in 1844 by the "Wisconsin Phalanx," an organization of 19 members, founded at Southport, Wis., based upon Fourier's principles. The city was named Ripon by John Homer, whose ancestors had lived in Ripon, England. The "Phalanx" prospered and held together as an organization for six years. The reports of gold in California was one of the causes of unrest which led to the voluntary and peaceable disbanding of the organization in 1850. The city was incorporated in 1849 and chartered in 1858. Ripon claims to be the birthplace of the Republican party, and one of the historic buildings is pointed out as the place where the first meetings were held and where the party received its name. The chief industrial wealth of the city is connected with the products of the rich farms of the valley. Grain, fruit and vegetables are abundant, and the dairy products are of considerable value. The chief manufacturing establishments are knitting works, glove factory, grain elevators, washing-machine works, veneer works, carriage works, machine shops, and pickling works, creameries, box and crate factories and flour and feed mills. There are several churches and a number of fine business blocks. The educational institutions are Ripon College, organized in 1851; a high school, graded elementary schools, a parochial school and a free public library. The three banks have a combined capital of over \$2,000,000. The government is vested in a mayor and a council of eight members, who hold office two years, four of whom are elected each year. Ripon is a favorite summer resort on account of its climate, beautiful scenery and the attractive drives to nearby points of interest. Pop. 4,090.

RIPON COLLEGE, located at Ripon, Wis., organized in 1850. It was founded under the name of Brockway College and received its present name in 1863. Though the Congregationalists have contributed largely to its support and prosperity, it is not under denominational control. Its organization includes a collegiate department, a preparatory department and departments of music and of art; normal courses are also given. In 1901 the group system of elective studies was adopted and a new professorship in history and economics established; the collegiate courses are arranged in three general groups, classical, literary and scientific, but only the one degree of A.B. is conferred. Women are admitted to all departments. The campus includes 10 acres; the library contains 20,843 volumes. The students for the year 1917-18 numbered 234, and the faculty 20.

RIPPLE MARKS. See section on *Structure* in the article on *GEOLOGY*.

RISE OF THE DUTCH REPUBLIC. The, a historical work by John Lothrop Motley. first published in 1856. It proved an immediate popular success, and was followed by a French translation (supervised with an introduction by Guizot) in 1859, and soon after by Dutch, German and Russian translations.

RISE OF SILAS LAPHAM, The. 'The Rise of Silas Lapham,' by William Dean Howells, on its first publication in 1884 won a popular and critical approval which speedily assigned it to a place among the classics of

realistic fiction, perhaps the chief American novel in that type. Compared with other books by the same author, it is hardly as great in range or as broad in canvass as 'A Hazard of New Fortunes,' hardly as disconcerting by its pungent accuracy as 'A Modern Instance,' hardly as winged with laughter as 'Indian Summer,' but it goes beyond any of them in its combination of qualities. Its theme is the universal one, particularly dear in a republic, of the rising fortunes of a man who has had no aid but virtue and capacity. Silas Lapham appears when he has already achieved wealth, and finds himself drawn, involuntarily enough, into the more difficult adventure of adjusting himself and his family to the manners of fastidious Boston. A writer primarily satirical might have been contented to make game of the situation. Howells, neatly as he hits off the conflict of standards, gives it the depth of meaning which comes only from a profound understanding and a mellow pity. The conflict, however, while constantly pervasive in the book, does not usurp the action, and the Lapham family has serious concerns that might have come up anywhere. Most intense and dramatic of these is the fact that the suitor of one daughter is believed by the whole family to be in love with the other until the very moment of his declaration. The distress into which they are thrown and the methods by which they free themselves from the predicament are presented with a degree of subtle comprehension rare in any novel, and here matched with an equally triumphant common-sense. Indeed, a certain rightness of feeling, equally removed from satire and sentimentalism, may perhaps be called the book's essential merit. As the story proceeds, as Lapham falls into heavy financial vicissitudes, finally to comparative poverty again, and yet through all this actually rises in spiritual worth, the book steadily grows in the dignity which is founded on truth. Without a touch of heroics in style or events, trusting confidently that to be veracious will suffice, it abounds in memorable revelations of human character and wisdom.

CARL VAN DOREN.

RISHI, rī'shī or r'shī, sages of the Hindu mythology, sprung from the mind of Brahma, and attendants in alternate months on the sun. Seven of them are enumerated. The rishi are connected with the star worship; and the seven rishi form the constellation of Ursa Major in the Hindu astronomy. The rishi were also inspired sages, of whom the Vishnu Purana enumerates three kinds—royal rishi, or princes, who have adopted a life of devotion; divine rishi, who are both sages and demigods, and Brahman rishi, or sons of Brahma. 'Rishi' afterward came to be applied to all personages distinguished for piety and wisdom. Consult Macdonell, A. A., 'History of Sanskrit Literature' (London 1913).

RISORGIMENTO, The. The Italian word, 'risorgimento' means literally 'rising again.' In some of its verb forms the word is seen to be cognate with our 'resurrect.' In Italian history the meaning of the word is the rebirth or remaking of the Italian nation. It thus covers the period of revolt from Austrian domination and establishment of the present kingdom—the risorgimento was the founda-

tion of united Italy. It began in 1831, when Mazzini founded 'young Italy.' The influential paper which Cavour edited in the stirring midcentury was called *Il Risorgimento*.

RISTORI, rēs-tō'rē, Adelaide, Italian actress: b. Cividale, Italy, 29 Jan. 1822; d. Rome, 9 Oct. 1906. She appeared on the stage as a child, and her early parts were in Soldoni's comedies. After her marriage in 1846 to the Marchese Giuliano del Grillo she retired from the stage for a time, but after her return she devoted herself thenceforth to tragic rôles. In 1855 she appeared in Paris in Silvio Pellico's tragedy of 'Francesca da Rimini' and achieved a great success. Her engagement there was followed by a tour of Europe; and from that time she was frequently seen in the large cities of the Continent and Great Britain. She made her first appearance in America at the Lyric Theatre, New York, 20 Sept. 1866, and her tour of the United States lasted for eight months. In 1869 she played in South American cities and in 1874 made a journey round the world. She made her fourth and last visit to the United States in 1884-85, and during that tour, which ended in May of the following year, she appeared as Lady Macbeth in company with Edwin Booth. After 1885 she did not appear on the stage. Her greatest parts were Mary Stuart, in Schiller's drama 'Myrrha,' Medea, Phædra, Lady Macbeth and Queen Elizabeth. Consult Mantellini, G., 'Memories and Artistic Studies of Adelaide Ristori' (a translation of her own autobiography; Garden City, N. Y., 1907).

RITCHEY, George Willis, American astronomer: b. Tupper Plains, Ohio, 31 Dec. 1864. He was educated at the University of Cincinnati. He was superintendent of instrument construction at Yerkes Observatory in 1899-1904; was connected with the faculty in astronomy at the University of Chicago in 1901-05; and in 1905-09 he was astronomer and superintendent in charge of instrument construction at the Solar Observatory, Carnegie Institute. In 1909 he became astronomer and engineer in charge of the designing and construction of a 100-inch reflecting telescope.

RITCHIE, rich'i, Alexander Hay, American artist: b. Glasgow, Scotland, 14 Jan. 1822; d. New Haven, Conn., 19 Sept. 1895. He studied under Sir William Allan at the Royal Institute, Edinburgh, went to Canada in 1841 and later settled in New York. He engaged in business as an engraver and established a considerable reputation for his work, which was chiefly of the mezzo-tint variety. He was also known as a painter. He was elected an associate of the National Academy in 1863 and academician in 1871. Among his paintings are 'Mercy Knocking at the Gate' (1860); 'Baby, Who's That?' (1871), etc. His engravings include 'Mercy's Dream' (1850); 'George Washington' (1852); 'On the March to the Sea' (1868), etc.

RITCHIE, Anna Cora Ogden (Mowatt), American actress and author: b. Bordeaux, 1819; d. Henley-on-Thames, near London, England, 28 July 1870. She was successful as a playwright and dramatic reader, and in 1845-54 appeared with much favor on the stage in both the United States and England, where she was seen with E. L. Davenport (q.v.). In London and Manchester she was leading lady to

Davenport. In 1854 she married W. F. Ritchie, editor of the *Richmond Examiner*, her first husband having died the preceding year. From this time on she retired from the stage and devoted her time to literature and play writing. Some of her books were published under the pseudonyms of "Isabel" and "Helen Berkley." They include 'The Fortune-Hunter' (1842); 'The Mute Singer,' 'Fashion,' a comedy (1847), which was very popular; 'Evelyn' (1845); 'The Autobiography of an Actress' (1854), the best-known and most popular of her productions; 'Mimic Life' (1855); 'Fairy Fingers' (1865); 'The Clergyman's Wife' (1867). Consult 'Autobiography of an Actress,' by herself (Boston 1854).

RITCHIE, LADY Anne Isabella Thackeray, English author: b. London, 1837; d. 1912. She was the eldest daughter of William Makepeace Thackeray (q.v.). She was educated at Paris and Kensington and in 1877 was married to Richmond Ritchie. Her first literary work was published in the *Cornhill Magazine* while her father edited that periodical. In 1863 she published 'The Story of Elizabeth,' which met with success. From that time she published fiction, biography and literary reminiscences, among which are 'The Village on the Cliff' (1865); 'To Esther and Other Sketches' (1869); 'Old Kensington' (1873); 'Toilers and Spinners' (1873); 'Bluebeard's Keys' (1874); 'Miss Angel' (1875); 'Anne Evans' (1880); 'Madame de Sévigné' (1881); 'A Book of Sibyls' (1883); 'Mrs. Dymond' (1885); 'Records of Tennyson, Ruskin and Browning' (1892). The biographical edition of Thackeray's works was edited by her, and her prefaces and notes contain a partial substitute for an authoritative biography against which Thackeray left a prohibition. Her 'Chapters from Some Unwritten Memoirs' (1895) is a work of autobiographical character.

RITCHIE, Thomas, American journalist: b. Essex County, Va., 5 Nov. 1778; d. Richmond, Va., 12 July 1854. He studied medicine and later engaged in teaching, but in 1804 became owner of the *Richmond Examiner*. He changed the name of that paper to the *Enquirer* and acted as its editor for 40 years, making it an organ of unusual influence. In 1845 he acceded to the request of President Polk and, resigning the *Enquirer* to his two sons, he went to Washington and took charge of the *Union*, the administration paper. He retired in 1849. He was a strong advocate of State-rights and a picturesque and dominating figure in the political world.

RITCHIE, Sir William Johnstone, Canadian jurist: b. Annapolis, Nova Scotia, 28 Oct. 1813; d. Ottawa, 25 Sept. 1892. He was admitted to the bar of New Brunswick in 1838, was appointed queen's counsel in 1854 and served in the executive council of the province from 1854 until he was appointed puisne judge of the Supreme Court of New Brunswick in 1855. He became chief justice of New Brunswick in 1865; puisne judge of the Supreme Court of the Dominion in 1875, and was chief justice of Canada in 1879-92. He was knighted in 1881. He was deputy-governor of Canada in place of Lord Lorne for six months in 1881 and three months in 1882; and in 1884 was

appointed deputy-governor under Lord Landsdowne.

RITE AND RITUAL (Latin, *ritus*, custom, connected with Sanskrit *ri*, and it is, therefore, from the same root as river, the thing that flows); in modern religious use any external sign or action employed as an expression of reverence or devotion, or as a means of exciting religious sentiments. The ancient religion of Judaism abounded in rites and ceremonies, and the sect or school of the Pharisees appears to have laid more stress on compliance with those observances than on the weighty injunctions of the law. Jesus Christ repeatedly expressed contempt for the scruples of the Pharisees, and many of those who aim to walk strictly in his footprints repudiate everything like ceremonialism in divine worship. But the vast numerical majority of Christians demand a more or less stately and impressive ceremonial. Rite is used also to express the sum of the ceremonial employed in the administration of the sacraments, as, the "rite" of baptism, the "rite" of confirmation, "the last rites." The entire liturgical ceremonial of a particular branch of the Church is spoken of as a "rite," for example, Latin rite, Greek rite and Syrian rite. All these, however, are but modern manifestations of very primitive communal ceremonies which, in the beginning, were very little, if at all, religious in point of view, in sentiment or in ceremonial execution. Rites represent the organization of religious procedure, generally throughout long ages. They may, therefore, be said to be the outward manifestation of religion, the dress which distinguishes one religion or one faith from another. They are when they appear to be individual, for the nature of the ceremonial rites performed in his own home by the individual is exactly similar in form and intent to that of the rites performed by all the members of the same tribe or primitive racial organization, under the same conditions and for the same ends. The individual rite is, therefore, nothing more or less than the resolution of the congregational rite into its component parts. On the other hand, the congregational rites represent the common interests of the members of the community. Both pertain to the common life in its general and yet most intimate functions and vital interests. In primitively organized society the rites were largely, if not altogether, intended to control or favorably influence those powers which, by common consent, were recognized as being greater than those possessed by man himself. But certain rites seem to have been intended to encourage certain beneficent beings, among them the gods of growth and fruition, to become even more favorable to man. Of such a nature were the great spring, summer and autumn festivals common to many races. To this category, too, belonged the ancient rites performed at birth, baptism, puberty, marriage and death and other inter-related ceremonies with their attendant, invariable rites.

Ritual and Myth march hand in hand down the long ages of time, extending mutual help to one another all along the way. Sometimes an elaborate myth apparently grows out of a tribal ceremony; and sometimes elaborate and complicated rites are built up about a racial myth. These act and react upon one another

and are subject to extraneous influences which tend to modify the form and the spirit of all ceremonies and their attendant rites. Ritual is a generally recognized form of performing certain ceremonies growing out of the past experiences of a people of which they are commemorative. For this reason the origin of most rites must be sought in the long past, and the more primitive of them can be intelligently studied only in connection with their corresponding myths. The primitive belief in the animate nature of things animate and inanimate and in the magic power possessed by certain beings gave rise to the use of magic formulæ, spells and charms. He who possessed the most powerful of these was believed to be able to conquer adverse powers through them. These assumed certain ritualistic definite forms which it was not permitted to vary. With these forms went stories or myths explaining their origin and sometimes their efficacy and mystic signification. Certain ceremonies commemorative of the popularly believed origin of the myth commemorated the myth itself, and the ritual laid down the exact form in which the commemorative ceremonies were to be observed. These early ceremonies and rituals seem to have been all magical in form and intent. The efficacy of the magic or charm consisted in the performance of the ceremony in the exact manner and words prescribed by the ritual, by tradition and by custom. Hence the medicine men, myth guardians, instructors or by whatever name they were known in the various more or less primitive societies, spent years in becoming familiar not only with the ritual itself but with its attendant ceremony and its accompanying myth or myths. As society grew more complex and human interests more confederated, rituals became more complicated and their myths more involved. Thus the former became more difficult of performance and the latter required greater skill for their elucidation. The medicine men and myth guardians and elucidators were gradually forced to give all their time to this work. Thus a formal priesthood came into existence. The priests were the natural guardians of the traditions of the tribe or nation. As they were the magic workers they were looked upon with special reverence by the rest of the people, and they were feared on account of their supposed possession of powerful magic, charms and other mystic knowledge, all of which formed a complicated and extensive tribal ritual. As the powerful beings feared by primitive man developed into gods the medicine men became the sacred depositories of celestial knowledge and their ancient ceremonies and rituals were attributed to the revelation of the gods. In this connection they assumed an additional sacredness which tended still more to stereotype them.

Ritual and Writing.—Naturally all primitive religions have shown a fondness for cabalistic signs, and some of the more developed of modern religions still exhibit strong traces of this primitive influence. As religious rites and ceremonies became more complicated and complex, signs known only to the medicine men or priests were made use of as an aid to the memory in the memorizing of the ritual and attendant myths. Often signs of this kind were painted on the wigwags, altars or temples; and on account of this connection they assumed a

sacred character. These signs naturally became more numerous and complicated with the extension of the primitive ceremonies and rites. When these first hieroglyphic signs grew into formal hieroglyphic writing they still remained the property of the priesthood, and as such retained their sacred character. The knowledge of writing was looked upon by the masses of the people as nothing less than very powerful magic, or in other words, a series of cabalistic charms or ritual. Hence the great culture gods of the races throughout all the ages of barbarism are represented as revealing to the human race the magic of the written word in which great power was believed to reside. Thus the Biblical expression: "In the beginning was the Word; and the Word was with God; and the Word was God," is literally the attitude of the people of an earlier age toward the supposed miraculous attributes of the written word, representative of the divine rituals, incantations, charms, hymns and songs, all of which were, in themselves, but so many different forms of primitive rituals. Thoth, the great culture god of the Egyptians, was the revealer of writing to the human race. The books of Thoth, which seem to have consisted of religious rituals and a compilation of the scientific knowledge of the age, were looked upon as not only extremely sacred but as miraculously powerful; and strangely modern Egyptian romances recount the adventures of those who either tried to secure possession of Thoth's secret book or actually did obtain it and the terrible mishaps that befell them. In these stories the belief in the divine nature of writing is strongly in evidence.

Ritual, Charms and Incantations are essentially the same in origin. The efficacy of the charm or incantation depended upon its being recited in a certain prescribed form. The greater part of the worship of primitive races has always consisted of charms and incantations accompanied by offerings and sacrifices, which are but another form of offerings. The charms and incantations were made use of with a view to opposing powerful known magic to the great magic of the superior being addressed, while the offerings were made with a view to pleasing or propitiating him. In the course of time the ritual connected with these charms, incantations and their accompanying ceremonies became extensive and more or less obligatory in form. Gradually the dramatic picturesque ceremony superseded the charm element in the imagination of the participants in the ceremonies; and the ceremonial rites assumed a form of worship in which the being addressed continued, as time went on, to play a larger and more important rôle. But the idea of magic and charm was eliminated very slowly from the minds of the masses of the people. The formal ritual of the blessing of the water was believed to give it miraculous power; the rite of baptism was a more or less sure protection from the evil one. Marriage, from being one of the loosest and most irregular and non-formative unions, became, as the rite connected therewith assumed a complex and mystical form, one of the most sacred of religious and divine institutions enjoined by heaven and revealed by the deity. By the rite of anointment and inauguration the sovereign became a semi-divine character, the anointed of the Lord, the representative of

heaven upon earth. Out of the rites, ceremonies and traditions rose the doctrine of the divine right of kings, which seems to have been at one time more or less universally subscribed to among civilized and semi-civilized forms of government. Baptism, as a rite, became, among Christians, of such importance that it was believed that without it no one could enter the kingdom of heaven. Auricular confession, too, assumed the form of a rite of the Church, though perhaps not originally specifically classed as such.

What has taken place in the Christian Church had already taken place in the great pagan religions of Greece, Rome, Carthage, Egypt, Babylonia, Assyria and India; and the same tendency was noticeable in the Jewish faith.

Everywhere a sacredness was ascribed to the religious ritual to which was also attributed a mysterious virtue of power strongly similar to the ancient charms and incantations about which most of the ritual was built. Every ceremony of a religious nature, among these races, had its accompanying ritual, rigid, unchangeable, obligatory in form and generally believed to be of wonderful efficacy. Some of these ceremonies with their accompanying rites were of such a complex nature and so extensive that the performance of them occupied a week or more each year and called forth the unrestrained energies of a people. Every important event in life has its corresponding ceremony and rite. This seems to have been an almost universal tendency of man in a certain stage of racial development. Among most of the races of North and Central America and the west and north of South America there were ceremonies and rites connected with birth, puberty, marriage, death, war, peace, spring-time, harvest, the undertaking of a journey or the beginning of some important enterprise. The people of these regions possessed elaborate rites according to which the germination, ripening and gathering of the crops were celebrated. Every trade, guild or occupation had its patron deity, its holy day and a special ceremony and ritual connected therewith. With such a multiplicity of deities, naturally there was considerable similarity among the hundreds of rituals; and yet there were also some striking and spectacular differences.

Secret Rites.—In ancient religious and semi-religious societies the secret rites were frequently more elaborate and of far greater importance than the public rites. This is explained by the fact that the former were proprietary and, as such, naturally inspired greater personal interest and called for more detailed attention and elaboration. Where the secret rites existed, and they existed extensively in more primitive society, they were the really significant rites of the celebration, pregnant with meaning and associations for those privileged to take part in them, while the public rites were in general the drama or play, of a commemorative and informative nature presented for the general use and interest of the people. Many of the ancient Egyptian, European and Asiatic secret rites were widely spread and exercised profound influence upon the national life. Some of them, as the Eleusinian mysteries, possessed fine temples, elaborate rituals and thousands of devotees who performed all their important

rites behind closed doors; and took into partnership with them in the performance of these rites certain of the deities. The secret part of these rites was looked upon as very sacred. The public rite soon became little more than a dramatic performance for the edification and entertainment of uninitiated masses; and as such it continued to degenerate.

Secret rites were a notable feature of the great religious ceremonies of the North American Indians in general. Almost always these secret rites were performed in a medicine lodge or great tepee erected for the occasion and dedicated to this use alone. Into this chamber none but the initiated may enter and it is marked by cabalistic signs which distinguish it from all other dwellings and give it at once a semi-sacred, semi-mysterious nature. Processions, dances, offerings, purification ceremonies, songs, incantations, prayers, all performed in a manner rigidly enjoined by the ritual, generally form part of the secret ceremonies of most of such societies. There too the priests and other participants rehearse the mythical story or legend of the origin of the society and its peculiar rites and ceremonies. Among most Indian secret societies one of the ever-present rites is that of smoking to the six directions of the universe, east, west, north, south, upward and downward. Often, too, an elaborate ceremonial feast forms part of the obligatory rite. This may be private or public or both, and is frequently preceded or followed by the sacrificial food offering. Not infrequently a public altar is erected by the masses of the people, under the direction of the priests, on a certain day or days set apart between the secret and public rites. This in itself may be said to form an integral part of the rites since it is of deep mystical symbolization, symbolizing some god, culture hero, the earth, the heavens, the universe according to the ritualistic tradition of the tribe. The rites of this altar and its symbolism frequently represent the four wind gods, the great and sovereign rulers of the four quarters of the earth, the thunder gods and the spirit of the rainbow, the long bridge spanning the earth-land and the sky-land. The public performance also follows an elaborate, rigidly-defined ritual, the prominent features of which generally are smoking, sacrifices, specific dances, dramatic presentations of legend and tradition, oratorical exhortations, prayers, processions and traditional songs generally sung by choruses. Masks are frequently worn and mythological characters are impersonated according to a plan rigidly defined and exacted in the tribal rite of the ceremony.

The tendency everywhere and at all time has been for ceremonial rites to become rigidly stereotyped, a fact due to the ever-present belief in the magic efficacy of the spoken word, of incantations and mystic signs presented in certain forms approved by antiquity and tradition. In ancient and modern ceremonial rites everything is ruled by precedent. From Rome to Egypt, from Persia to Hindustan and China, from Greenland to Yucatan, from Central America to Peru, even the decorations and symbols of the ceremonies and of the tepees and temples were fixed and practically unchangeable in the pre-Columbian days.

Changing of Rites.—This very unchangeableness of customs and ritual and the tend-

ency to relegate the most important and solemn of the rites to societies and lodges to associations of priests and nobles, and to reserve the spectacular and the dramatic for the great public performances had two tendencies which became invariably destructive of the ceremonies they were interested in preserving. A strong priesthood and a powerful privileged class elaborated these ceremonies and rites and read into them symbolical meanings they did not originally have, and overloaded the ritual, binding it soul and body to the secret societies and the ruling class. The symbols, in the course of time, became conventionalized and the original signification of the religious rites forgotten or obscured. Gradually for the masses, the celebration of the great ritualistic feasts became the occasion of a public holiday, often accompanied by licentiousness and debauchery. The meaning of the sacred or mystical symbols obscured or forgotten or a new signification read into them, they insensibly and gradually changed form or assumed stereotyped shapes to which semi-mystical, semi-magical powers were still attributed. Thus it was that the original temple decorations, once pregnant with meaning, became transformed into conventional decorations. In this latter shape they might still continue to attach themselves to the ritual of which they had originally formed an integral part. In the later Greek and Roman Classical periods the ritualistic decorations had become almost altogether conventionalized and their meaning obscured or lost. The Aztecs and Mayas, at the time of the Conquest, had arrived at the transition period when the ritualistic symbols were beginning to become stereotyped while still retaining most of their mystic signification. Among many of the northern Indian races mysticism and symbolism were still linked with the ritual and never used apart from it. These different grades of civilization illustrate well the insensible changes of ritual and its attitude toward its origin in the course of ages of social and religious evolution. Thus ritual, while apparently often stationary, is continually changing with the never-ceasing changes of the ages. This is due to the part that personal religion tends to be informal which state or tribal religions tend to wrap themselves about with ceremonies borrowed from court ceremonies and surroundings, vocabulary and relationship. Just as state ceremony tends to become top-heavy under autocratic governments and finally to fall by its own weight, so the ceremonies of state and tribal religions are born down by the weight of their own ritual, generally after centuries of slow growth and very gradual change leading to more and more ornate, involved and obscure symbolism. The whole course of ritual evolution is affected by the constant borrowings of races and creeds from one another, and the ever-present tendency to develop new forms from old.

The individualism of strong men has also, from age to age, had a very decided influence upon the upbuilding and new interpretation of ritual, or upon its simplification or total or partial destruction. This is well exemplified in Biblical history, in the growth of ritualism in the state religions of Egypt and those of Assyria, Babylonia and India; and more recently in the development of Christianity, first as an iconoclastic force directed against ritualism, and

later as one of the greatest ritual-building agencies. This ritual-building was arrested and strongly affected by the individualism of such men as Zwingli, Erasmus, Calvin, Melancthon and Luther, the most active leaders of the Reformation. Since their day the more individualistic leaders of Protestantism have made repeated attacks upon ritualism until now little or nothing of the original ritual remains in the more ultra Protestant churches, and with the ritual have disappeared much of the dogma of the Roman Church and many of the customs, traditions and practices inherited by it from the earlier ages of Christianity or from pre-Christian times. Much the same tendency is noticeable in the Mohammedan faith which has developed from a distinctly iconoclastic force, in its earlier days, into a strong fortress of ritualism.

Contra-Currents.—Where the tide is strong and constant in one direction there are apt to be contra-currents. This is true of the ever-constant tide of ritualistic change. Within the Protestant bodies there has ever existed a contra-current in favor of the preservation of the essentials of the rituals of the earlier Christian Church. Luther himself, though proclaiming doctrines destined ultimately to shake the throne of ritualism throughout the Christian world, was himself at heart a ritualist. The Anglican Church, though the most determined of opponents of Rome in the days of its early struggle, has clung tenaciously to much of the Roman ritual; while a certain section of the Anglicans still stand for elaborate ritualism and symbolism in formulas and service of the church. The Hindu religion has had the same experience, in a more pronounced manner, for numerous sects within the ecclesiastical body stand to-day for the maintenance or extension of ancient ritual. In Egypt, when the symbolism of the state church had become complex, extensive and elaborate, there were constant undercurrents, which on two, if not more, occasions succeeded, for a time, in getting the upper hand. In Mexico, under the Aztecs, in the later days of the Montezumas, there was a strong double reaction in favor of a return to the earlier ritual of the tribal nature worship. The headquarters of this reaction was in Texcoco, the old Chichimeca capital. So strong was this reaction, in the days preceding the Conquest, that it seemed in a fair way ultimately to overthrow the state religion of the Aztec Empire, which had already been so strongly affected by the efforts of the followers of the ancient Toltec faith that the statue of the chief Toltec divinity, Quetzalcoatl god of the winds, had been set up in the great temple of Tenochtitlan (Mexico City) by the side of the chief of the national and state deities, and in many other temples throughout the Aztec Empire. In the history of the evolution or disappearance of ritual these contra-currents are constantly in evidence, working a change of direction, often in the main stream.

JOHN HUBERT CORNYN,
Editorial Staff of The Americana.

RITES, Congregation of, a commission or standing committee of cardinals of the Roman Catholic Church, instituted in the 16th century by Sixtus V. Its function is to exercise supervision throughout the entire Church over all ecclesiastical rites and ceremonies, in particular those belonging to the mass, with a view to preventing the introduction of novelties without express approval, and to maintain unaltered the usages sanctioned by the tradition of the Fathers and the prescriptions of the rubrics. It is the Congregation of Rites that takes cognizance of all matters concerned with beatification and canonization.

RITROVAMENTO. See **INVENTION OF THE CROSS.**

RITSCHEL, rich'el, Wilhelm, American artist: b. Nuremberg, Bavaria, 11 July 1864. He studied at the Royal Academy, Munich, and in 1895 came to the United States. He has specialized in marines, and his paintings have been shown at important exhibitions in America and Europe. He was elected to the National Academy in 1914. Among his paintings are 'Hauling up the Boats' (1908); 'Midsummer Night, Maine' (1912); 'Glory of the Morning, Pacific Coast' (1913), etc.

RITSCHL, rich'el, Albrecht, German theologian: b. Berlin, 25 March 1822; d. Göttingen, 20 March 1889. He studied at the universities of Bonn, Halle, Heidelberg and Tübingen, qualified at Bonn as a lecturer in 1846, became extraordinary professor of theology there in 1852 and ordinary professor in 1859. In 1864 he accepted a call to the corresponding chair at Göttingen. From 1874 he was a consistorial councillor. In his early thesis, 'Das Evangelium Marcions und das kanonische Evangelium des Lukas' (1846), he adopted the position of his master, F. C. Baur, but in the first edition (1850) of his 'Entstehung der altkatholischen Kirche' ('Origin of the Early Catholic Church') he showed signs of divergence, and the publication of the second edition of the latter work in 1857 marked his complete severance from the Tübingen school. His chief subsequent works are 'De Ira Dei' (1859); 'Die christliche Lehre von der Rechtfertigung und der Versöhnung' ('The Christian Doctrine of Justification and the Atonement,' 3 vols., 1870-

74), his chief work; 'Schleiermacher's Reden über die Religion und ihre Nachwirkungen auf die evangelische Kirche Deutschlands' (1874); 'Die christliche Vollkommenheit' ('Christian Perfection,' 1874); 'Unterricht in der christlichen Religion' (1875; 5th ed., 1895); 'Geschichte des Pietismus' (1880-86); 'Theologie und Metaphysik' (1881); 'Drei akademische Reden' (1887); 'Fides Implicita' (1890); and 'Gesammelte Aufsätze' ('Collected Essays,' 1893 and 1896). Ritschl founded a school of theology still of much importance both in Germany and in other countries. Starting from a subjective theory of cognition, based upon the philosophy of Kant as developed in Lotze, he sought to eliminate the whole metaphysical element from religion. He was thus led to reject such doctrines as original sin, the Trinity, the incarnation, whether historic or mystical, and the whole of natural theology, as of no religious value, and he denied the pre-existence and miraculous birth of Jesus. He laid stress upon the historical character of Christianity, but held free views of inspiration and admitted the most advanced criticism. His view of the atonement was essentially the same as the 'moral influence' theory of liberal theologians.

A., 'Faith and Fact' (1910); Garvie, A. E., 'The Ritschlian Theology' (1902); Mielke, G., 'Das System Albrecht Ritschl' (1894); Mozley, J. R., 'Ritschlianism' (1909); Orr, J., 'The Ritschlian Theology and the Evangelical Faith' (1899); Pfeiderer, 'The Development of Theology in Germany since Kant' (1890; German ed., enlarged, 1891); 'Die Ritschlsche Theologie kritisch beleuchtet' (1891); Ritschl, O., 'Life of Ritschl' (1892-96); Schoen, 'Les origines historiques de la théologie de Ritschl' (1893); Swing, A. T., 'The Theology of Albrecht Ritschl' (1901).

RITSCHL, Friedrich Wilhelm, German classical scholar: b. Grossvargula in Thuringia, 6 April 1806; d. Leipzig, 9 Nov. 1876. He was educated at Leipzig and Halle, where he devoted himself to classical studies, and in 1832 was appointed extraordinary professor at Halle. He subsequently held professorships at Breslau and Bonn, and in 1865 accepted a call to Leipzig, where he remained until his death. He was a very popular and successful teacher. His chief work is a critical edition of 'Plautus' 'Comedies' (1848-54, incomplete; entirely remodeled edition, 1881-94). His other works include 'Parerga Plautina et Terentiana' (1845); 'Priscæ Latinitatis Monumenta Epigraphica' (1864); 'Opuscula Philologica' (his miscellaneous papers in 5 vols.). Consult Müller, L., 'Life of F. W. Ritschl' (Berlin 1877); Rübbeck, O., 'Life of Ritschl,' published in Leipzig in 1881; Sandys, J. E., 'A History of Classical Scholarship' (Cambridge 1908).

RITSON, Joseph, English antiquarian: b. Stockton-on-Tees, England, 2 Oct. 1752; d. London, 23 Sept. 1803. He studied law, became conveyancer in London and deputy high bailiff to the duchy of Lancaster. For many years he devoted his time to antiquarian researches and the editing of rare books, and he assisted Sir

Walter Scott in preparing his work on the 'Border Minstrelsy.' His works include 'Observations on Warton's History of English Poetry' (1782); 'Ancient Songs from the Time of King Henry II to the Revolution' (1790); 'Cursory Criticisms' (1792); 'Bibliographica Poetica' (1802); 'Ancient English Metrical Romances' (1802). Consult Hastewood, 'Some Account of the Life and Publications of the Late Joseph Ritson' (London 1824); Nicholas, Sir Harris, 'Letters of Joseph Ritson' (London 1833).

RITTENHOUSE, David, American astronomer and mathematician: b. Germantown, Pa., 2 April 1732; d. Philadelphia, 26 June 1796. His great-grandfather, Willem Rittinghuysen, a Mennonite from Holland, in 1688 set up, on Wissahickon Creek, the first paper mill in America. From an uncle the boy inherited some books on calculation and geometry, and henceforth his life was determined. Mathematics and computation became his absorbing passion. He had great facility in mechanical invention and execution. In his teens he began to make clocks of wood and metal, and his father set him up in the business of maker of mathematical instruments and clocks. He is said to have independently discovered the method of fluxions or the calculus when but 19, and to have foreseen its vast utility, before he heard of the claims of Leibnitz and Newton.

In 1763 he laid out the 12-mile radius around Newcastle, which forms the boundary between Pennsylvania and Delaware, accurately with instruments of his own construction, and Mason and Dixon accepted his results as final. In 1769 he located the point where the 41st parallel of latitude, the boundary between Pennsylvania and New York, strikes the Delaware River. The same year the Pennsylvania legislature appropriated £200 toward the observations of the transit of Venus. Rittenhouse built an observatory near his home in Norriton, and in company with a committee appointed by the American Philosophical Society made preparations for the occasion. His results were the best obtained and the computed parallax of the sun the most accurate then known.

Rittenhouse invented the plan of placing spider lines in the focus of the telescope, an arrangement that has done more to make accurate measurements possible than almost anything else. In 1770 he completed his famous orrery based on computations of his own. This showed the movements of the planets and moons in elliptic orbits around their primaries, the phenomena of eclipses and the relative places of the members of the solar system over a time of 5,000 years preceding or following. For this he received £300 from Princeton University, and a like sum from the legislature of Pennsylvania for a second orrery for the University of Pennsylvania. The first was injured by the British troops in the Revolutionary War.

Then followed computations of the orbits of comets, surveys of the land between the Delaware and Susquehanna for canal purposes, calculations for almanacs and surveys for a series of dams to make the Schuylkill River navigable. He was engineer and finally president of the committee of safety of his State during the Revolutionary War, and plunged into

military problems with all his energy. In 1776 he was made a member of the assembly of Pennsylvania, the earliest under the reorganized Revolutionary movement, and was active in the creation of the new constitution, the first for the State of Pennsylvania. In 1777 and for 12 successive years he was elected State treasurer. He was also trustee of the Loan Office.

He determined the boundaries of Pennsylvania and the line between New York and Massachusetts. From 1779 to 1782 he was professor of astronomy in the University of Pennsylvania and afterward trustee and vice-provost. In 1792 he was made director of the United States mint by President Washington. After three years he resigned and returned to scientific work. He succeeded Franklin as president of the American Philosophical Society in 1790.

His publications (about 20) appeared in the *Transactions of the American Philosophical Society*. The most popular was an 'Oration on Astronomy.' An interesting 'Eulogium' was delivered after his death by Dr. Benjamin Rush. His life was written by his nephew, William Barton, in 1813, and by James Renwick in Sparks' 'American Biography.' An account of him, by S. W. Pennypacker, was issued in 1882.

RITTER, rit'ter, Frédéric Louis, American musician and composer: b. Strassburg, Alsace, 22 June 1834; d. Antwerp, Belgium, 6 July 1891. He studied music at Paris with Georges Kastner, taught at the seminary at Fénéstrange, Lorraine, and in 1856 came to America and settled at Cincinnati. There he organized the Cecilia (choral) and Philharmonic (orchestral) societies. Removing to New York in 1861 he became the conductor of the Sacred Harmonic and the Arion Choral societies. The first musical festival of note held in New York was given under his direction in 1867. That year he assumed the duties of the professorship of music at Vassar College, which position he held until his death. He was a prolific composer of vocal solos and choruses, among which were musical settings for several Psalms, 'O Salutaris,' an 'Ave Maria,' a group of Persian songs and more than 100 German lieder. He also wrote works for orchestra and pianoforte and was the author of 'A History of Music in the Form of Lectures' (1870-74); 'Music in England' (1883); 'Music in America' (1883); 'Manual of Musical History' (1886); and 'Musical Dictation' (1888).

RITTER, Heinrich, German philosopher: b. Zerbst in Anhalt, 21 Nov. 1791; d. Göttingen, 3 Feb. 1869. He studied at Halle, Göttingen and Berlin from 1811 to 1815, and in the last-named year the calling out of the volunteers led him to France. On his return he devoted himself exclusively to philosophy, especially in the department of history, in which he adopted the method and critical views of Schleiermacher. He qualified himself at Berlin as a university teacher, and from 1824 held an extraordinary professorship in that city until he accepted a call to Kiel in 1833. In 1837 he removed to Göttingen, where he continued to occupy the university chair of philosophy till his death. Ritter's best works belong to the history of philosophy, his first in this department being an investigation into the doctrines of Em-

pedocles in Wolf's 'Literarische Analekten' (1820). His 'History of Ionian Philosophy' (1821); 'History of the Pythagorean Philosophy' (1826), and 'Notes on the Philosophy of the Megarean School' in the Rheinisches Museum, are models of historical investigation on the principles of Schleiermacher. His historical masterpiece is the 'History of Philosophy' (1829-53), which deals with general history up to the time of Kant. It was supplemented by a 'Review of the History of German Philosophy from the Time of Kant' (1853).

RITTER, Henry, Canadian artist: b. Montreal, 1816; d. Düsseldorf, Germany, 21 Dec. 1853. He studied in Hamburg and Düsseldorf, and spent most of his life abroad. He specialized in subjects of a nautical character and was noted for his excellent coloring and careful finish as well as for originality. At his early death he left unfinished a number of paintings as well as a series of illustrations for Washington Irving's works. Among his works are 'Offer of Marriage in Normandy' (Leipzig Museum 1842); 'The Poacher' (1847); 'Indians Flying Before a Burning Prairie' (Kunsthall, Bremen 1851); 'Middy's Sermon' (Cologne Museum 1853), etc.

RITTER, Karl, German geographer: b. Quedlinburg, Prussia, 7 Aug. 1779; d. Berlin, 29 Sept. 1859. He was educated at Halle and resided for a considerable time at Göttingen in order to avail himself of its library. In 1819 he succeeded Schlosser as professor of history at the Frankfurt Gymnasium, and in 1820 became professor extraordinary of geography at the University of Berlin, an office which he held with distinguished reputation for nearly 40 years. With Ritter may be said to have commenced a new epoch in geographical science; and a new department, that of comparative geography, claims him as its founder. His great work is 'Die Erdkunde im Verhältnisse zur Natur und Geschichte des Menschen' ('Geography in its Relations to Man's Nature and History'), the first two volumes of which appeared at Berlin in 1817-18. Although it was afterward continued on a more extended plan, yet it was left incomplete, covering only Africa and Asia. It constitutes so far as it extends, 19 volumes (1822-59), a vast repertory of valuable information relative to physical and general geography. Among other productions of Ritter may be mentioned 'Europa, ein geographisch-historisch-statistisches Gemälde' ('Europe Delineated Geographically, Historically and Statistically,' 1807), and 'Die Stupas, oder die architektonischen Denkmäler an der indobaktrischen Königstrasse und die Kolosse von Bamyán' ('The Stupas, or Architectural Monument on the Indo-Bactrian Highway and the Colossi of Bamyán,' 1838). Consult Gage, W. L., 'Life of Carl Ritter' (New York 1867); Kramer, G., 'Carl Ritter: ein Lebensbild' (Halle 1875).

RITTER, William Emerson, American zoologist: b. Hampden, Wis., 19 Nov. 1856. He was educated at the universities of California, Harvard and Berlin and at the Stazione Zoologica, Naples, Italy. He has been associated with the faculty of the University of California since 1891, becoming professor of zoology there in 1902. He is director of the

Scripps Institution for Biological Research, formerly the San Diego Marine Biological Station, and editor of the zoological publications of the University of California. Author of 'War, Science and Civilization' (1915).

RITUAL (Latin, *ritualis*, pertaining to rites), in ecclesiastical usage a manual containing the forms to be used by the priest in administering the sacraments, namely, the communion (when given outside of the Mass), baptism, absolution, marriage and extreme unction; also in such rites as the churching of women, burial of the dead, blessing articles for religious uses, as water, candles, etc. The Roman Ritual now in universal use in the Latin Church was drawn up by order of Paul V, who (1614) "counseled" all prelates to conform to its prescriptions exactly. But though the Pope only counseled (*hortatur* is the word he employs in the bull *Apostolica Sedi*), a decree of the Congregation of Rites (1850) declares that the forms of the *Rituale Romanum* "affect the universal church." Before the issuance of the bull of Paul V there were various ritual manuals authoritative in different countries or different episcopal jurisdictions. In the Eastern churches generally, as in the Greek Schismatical Church, the Ritual forms part of the general service book, the Euchologion, which corresponds to the Missal, the Pontifical and the Ritual of the Latin Church. The ritual of the Anglican Church is contained in the Prayer Book under the heads "Ministration of Baptism," "Order of Confirmation," etc. In general Ritual is a term applied to any form used in continually repeated ceremonials. There have been rituals in the religions of most peoples; and these exist in many forms to-day among highly civilized and primitive races alike. Most of the Indian tribes of the North American continent had very rigid and complicated religious rituals. The term ritual is also used in many secret societies for the ceremonial forms used in receiving candidates into the various degrees of the order.

RITUAL LAW, that portion of the law of Moses which prescribes the ceremonies of public religious worship, the manner of making trespass offerings, the procedure for the discovery of leprosy, for the purification of women after childbirth, the discrimination of things clean and unclean, etc. The ritual laws of the Hebrews are contained mostly in the books 'Exodus,' 'Leviticus,' 'Numbers' and 'Deuteronomy.'

RITUAL IN MYTHOLOGY. See MYTHOLOGY.

RITUALISM, a term designating the practices of a party in the Church of England and the Episcopal Church in the United States and elsewhere, in surrounding the public worship with a variety of rites and ceremonies, and in resuscitating certain features and usages of the Catholic Church in pre-Reformation times, such as the use of ornate eucharistic vestments, use of the sign of the cross, belief in the 'Real Presence,' prayers for the dead, treating the communion service as a real sacrifice, auricular confession and many other beliefs and practices usually esteemed by Protestants as the insignia of "Romanism." But many, Ritualism is held to be only another nam-

for Puseyism and Tractarianism; but Dr. Pusey, the reputed father of Puseyism, never adopted any of the practices of Ritualism. The Ritualists defend their position against the charge that it is nothing but a revival of "Romanism" in the Protestant Church and that it is flagrantly inconsistent with the simplicity of Christian worship as portrayed in the books of the New Testament, by saying that not all authoritative regulation of ritual is laid down in the New Testament, and that what is obligatory in ritual is to be learned from apostolic tradition. They allege, in explanation of the simplicity of primitive Christian worship, the secrecy and restraint to which the church was subjected through the ages of the persecution. All through that time the apostolic tradition was preserved by the church. On the accession of Constantine the ritual of the church assumed its natural beauty and proportions. They cite the Anglican Book of Common Prayer in its original form as promulgated in the second year of Edward VI (1549) as authorizing most of the practices now condemned by Protestants as ritualistic and "Romanish." They contend that the Episcopal Church of England, with its daughter churches, is historically committed to the practices for which the Ritualists are censured. The following are some of the rites and usages which distinguish the Ritualists from the mass of Protestants whether in the Episcopal or other churches. The Ritualists hold that the "altar" is a necessary part of Christian worship. The Book of Common Prayer, in the "order for the administration of the Lord's Supper," carefully avoids the word "altar" and says always "table." The Ritualists revived the practice of auricular confession and set up in their churches confession-boxes as in Roman Catholic churches. They brought back into use the eucharistic vestments—dalmatic, chasuble, cope, etc. The Puritans held the cross an abomination; the Ritualists set it on top of their churches and in the centre of the altar—and not only the cross, but the crucifix. The Ritualists insist on the eucharistic vestments; the position to the east of the celebrant at the altar; the use of unleavened bread, the mixed chalice, altar lights and incense, and they pay formal adoration to the "Real Presence" of Christ's body and blood, believed to underlie the species of bread and wine.

The growth of Ritualism assumed such proportions in England that a commission was appointed by the government in 1867 for the purpose of inquiring "into the rubrics, orders and directions for the regulation of the conduct of public worship." Seven years later the "Public Worship Regulation Act" was passed for the express purpose of putting down Ritualism; and a judge was appointed to try cases of violation of the ritual. Numerous cases were tried, among the defendants being high dignitaries of the Established Church. Punishments, including imprisonment, followed. But persecution only caused the ritualistic movement to flourish. The Ritualists had the sympathy of many members of the church who were not themselves in favor of Ritualism, for it was very generally felt that it was not wise for the secular court to interfere in things spiritual and to compel priests, clergymen and congregations to refrain from practices which they held to be essential. Practically all the objections

against ritualistic practices were sustained by the judges before whom the cases were brought; but this not only failed to drive Ritualism out of the Established Church of England, but it also failed to stop or even retard its growth. The practices have been practically permitted by the legal authorities; so that Ritualism lives to-day strongly entrenched in the Episcopal Church, without fear of successful opposition from any quarter whatever.

The history of Ritualism in the Anglican Church in America is much the same as that of England, except that, on this side of the water, the secular government could take no part in the quarrel, the church on the Western continents being in no way connected with or dependent upon the government. A canon law passed in 1874 at the General Convention instructed the bishops to proceed against any minister "accused of introducing unauthorized ceremonies and practices." But though the power to discipline the Ritualists rests in the hands of the bishops, it has never been used; and Ritualism to-day attracts little or no attention or comment.

RITUALIST, one who is zealous for strict observance of ritual; in particular, one who advocates the use of the rites of Catholic worship in the Established Church of England or in the Episcopal churches which derive from the Church of England. See **RITUALISM**.

RIVALS, The. Not long after his marriage Sheridan was asked by the manager of Covent Garden Theatre to write a play for that theatre. He set to work with alacrity and finished 'The Rivals' in six weeks. For this undertaking he was by no means ill-adapted; his father had been an actor and his mother a playwright; and he himself had already on hand notes and sketches for scenes at least if not plays. 'The Rivals' was produced on 17 Jan. 1775. The play failed, partly because it needed cutting, and partly because of the character of Sir Lucius O'Trigger as it was acted at the initial performance; partly because of its threatened desertion of the sentimental comedy then the fashion. The piece was withdrawn,

shortened and Sir Lucius O'Trigger recast. The revival met with a remarkable success, which has lasted to our own day. Many charges of plagiarism were brought against 'The Rivals'; but the amount of actual literary theft is negligible. The comedy, however, descends from a long line of dramatic ancestors, and can be thoroughly studied from a technical standpoint only in the light of Plautus and Terence and the Greek remains, and of Molière and Congreve, Farquhar, Wycherly and some of the contemporary novels. It is a comedy of manners verging on the exaggeration of farce. The scenes made up of Julia's and Faulkland's high-flown and sentimental love affair have no relation to this authentic comedy and were thrown in by Sheridan as a sop to the prevailing taste of the day; and it is worth noting that when he came to write 'The School for Scandal' he made no such concession. Not only the great Joseph Jefferson and every high-school and dramatic society and stock company, but also the frequent quotation of many of the lines, have helped to keep 'The Rivals' alive. Every part in the play is actable, the invention of the humorous situations inexhaustible, and the wit and portraiture and motivation cast so happily within the theatrical tradition as to pass unflinchingly over any footlights.

STARK YOUNG.

RIVAROL, Antoine, ān-twān rē-vā-rōl, French satirical and political writer: b. Bag-nols, 26 June 1753; d. Berlin, 11 April 1801. He was one of the celebrated wits of the 18th century, possessing distinction, elegance and an astonishing facility in the expression of his thoughts that early gave him a position in the salons and at the court of Paris. His first work, which obtained a prize at the Academy of Berlin, was 'Discours sur l'Universalité de la Langue Française' (1784). The same year he published a translation of Dante's 'Inferno.' Later appeared 'Lettres à M. Necker' and in collaboration with Champcenetz, 'Petit Almanach des grands Hommes' (1788), a satire on the authors of his day. Becoming an émigré in 1792, he lived at Brussels, London, Hamburg and finally at Berlin, his works at this period being 'Lettres au Duc de Brunswick'; 'Lettre à la Noblesse Française' (1792); 'Vie politique et privée du Général La Fayette' (1792); also a preliminary discourse to a French dictionary (1797). In 1828 was published under his name a dictionary of the French language, which was not written by him. His collected works were edited by Chénedollé and Fayolle in 1808.

RIVAS, ré'vas, Angel Pérez de Saavedra, 3d DUKE OF, Spanish statesman and poet: b. Cordova, 19 March 1791; d. Madrid, 22 June 1865. He fought in the Spanish War for Independence, retired from the army in 1815 and in 1820-23 was prominent in the advanced Liberal party. He was secretary of the Cortes in 1821, but at the time of the French invasion of 1823 he was under sentence of death and escaped to England. He later went to Malta, and also lived in Italy and France, engaged in literary pursuits until the amnesty of 1834 permitted his return to Spain. He then succeeded to his brother's ducal title and in 1835 he became Minister of the Interior under Istúriz. Political troubles in 1837 forced him into a

second exile, and upon his return in 1843 he allied himself with the Moderate party. He afterward became Prime Minister and served as Ambassador to Paris and Naples. He had early established a reputation as a poet and dramatist and his long sojourns abroad had considerable influence upon his work, both poetry and drama. He was one of the first of the Romantic school of poets in Spain and showed much skill in adapting modern tendencies to the characteristics of Spanish genius. Author of 'Ensayos poéticos' (1813); 'El moro exposito' (1834); the dramas 'Slatar' (1814); 'Lanuza' (1822); 'Alvaro ó La Fuerza del sino' (1835), etc. His collected works were published (Madrid 1894-1904). Consult Piñeyro, E., 'El Romanticismo en España' (1904).

RIVAS, ré'vas, Nicaragua, a town between Lake Nicaragua and the Pacific Ocean, slightly northwest of the surveyed route of the Nicaragua Canal, and on the high road to Granada. It occupies the site of a Nicaraos Indian village. Pop. 6,000.

RIVÉ-KING, ré-va'king, Julie, American concert pianist: b. Cincinnati, Ohio, 31 Oct. 1859. She is the daughter of Léon and Caroline Rivé, the latter a musician and her first teacher, and was married in 1878 to F. H. King. She appeared first in concerts at the age of six. Later she was a pupil of Liszt. She has appeared in over 200 concerts with Theodore Thomas and 80 with Seidl, besides in many independent recitals. She ranks among the foremost solo-pianists in America.

RIVER BOUNDARIES. See BOUNDARIES OF THE UNITED STATES.

RIVER BRETHREN, a Christian religious denomination consisting of three communities: (1) 'The Brethren in Christ'; (2) 'The Old Order' or 'Yorker Brethren'; (3) 'The United Zion's Children.' The denomination is of Mennonite origin and was founded in Pennsylvania in 1770 by Jacob Engle. He, with his brother John, and 30 Mennonite families, came from Switzerland because of religious persecution and settled in Lancaster County, Pa. After a revival held by the Mennonites, Baptists and Lutherans in 1770, in which various differences in doctrine arose, the Engles and their followers withdrew and formed a body of their own, the name coming either from the fact of its members dwelling near the river or from their performing the act of baptism in the Susquehanna River. They believe in true immersion as the proper form of baptism, observe the ceremony of footwashing in connection with the eucharist, are strict Sabbatarians and hold non-resistance a cardinal virtue. The original order is known as 'Brethren in Christ'; 'The Yorker Brethren' withdrew in 1843; and 'The United Zion's Children' in 1852. The difference in the three bodies is slight. Owing to their members being drafted in the Civil War they sought legal status in 1862 in order to maintain their scruples against resistance. The order has spread from Pennsylvania into Ohio, Indiana, Kansas, New York and Canada. Its members in all bodies number about 5,000.

RIVER DOLPHINS. See PORPOISE.

RIVER OF DOUBT. See RIVER TÉODORO.

RIVER ENGINEERING. Introduction.

—River engineering is man's effort to create artificial form and behavior in streams for the betterment of his environment. Its purposes relate to transportation, power supply, agriculture, sanitation and security of life and property. River improvement is of present importance to any community according to its susceptibility to devastation by flood or bank cutting, the comparative economy of other means of transportation and power development and its natural agricultural and sanitary advantages. That the utmost in river improvement will eventually become an imperative necessity to continued prosperity and progress of industrial civilization, indeed to the possible perpetuity of such civilization, is attested by every argument for the conservation of natural resources.

Faults of Natural Streams.—While most streams are more or less useful to man in their natural states, they generally have characteristics or form or behavior that restrict their usefulness or constitute a menace. Natural low water discharge may fall short of the need for irrigation, power development or sanitary uses and high water discharge may exceed the drainage capacity of natural channels and spread over populated alluvial lands as a destructive flood. Bars and shallow crossings may limit navigation on streams that are otherwise well suited to this use. Alluvial streams habitually undermine and cut away their banks and menace or destroy valuable riparian properties. Streams build up their bottom lands unevenly and the lowest areas may be imperfectly drained and untillable. The regularity of grade that is characteristic of alluvial streams generally denies natural power sites to the regions best suited to human habitation and industrial concentration.

Origin of Faults of Natural Streams.

Low Water. The mantle of soil and loose rock detritus that generally forms the land surface acts as a reservoir in which part of the rainfall is stored as ground water. During periods of drought this reservoir is gradually drained; the plane below which the ground pores are full of water sinks deeper beneath the surface toward the levels of adjacent streams, the gravitative stress that forces seepage is diminished and consequently the rate of discharge falls off. The most marked falling off in discharge during drought occurs where the soil mantle is thin; the surface is compact; the topography is steep or gullied and precipitation is concentrated as to time.

Floods.—Floods vary as to cause and character between two extreme types,—the sporadic type that results purely from excessive local precipitation and the recurrent type that is due to the adjustment of processes of sedimentation to variable discharge.

The type example of the sporadic flood is the sheet flow that forms from cloudbursts. Such floods are virtually built in situ and with small regard for the topography of the affected area. Flow leads to their dissipation rather than to their concentration. Being due to local vagaries of weather, they can be neither forecast nor prevented. The more localized a flood is the more it partakes of the characteristics of the sporadic type.

Recurrent floods are typically developed in large delta-building streams that have variable discharge. Delta growth adds to the length of the channel and tends thereby to reduce the slope and erosional capacity of its lower reaches. The part of the load delivered from upstream that cannot be carried through the lower reaches is deposited. Deposition in the channel reduces its drainage capacity and when that becomes less than maximum discharge overflow is possible. When overflow occurs a part of the load escapes from the channel with the flood waters and accumulates alongside the stream, the coarse materials to form natural levees and the finer to form the more widespread flood plains. A nice adjustment is finally achieved among the delta, channel and flood plain forms that maintains a constant relationship among their different rates of growth. This adjustment keeps the drainage capacity of the lower reaches of the channel less than the higher phases of discharge and so renders the periodic overflow of its flood plains a normal feature of the stream's behavior.

Shallow Crossings.—The typical alluvial stream meanders, that is, its course consists of a series of alternating right and left bends. Where the direction of curve changes from one bend to another the channel shallows frequently to an extent that limits the navigability of the stream. Such shallows are called crossings.

The superior depths of the channel on bends is due to centrifugal force incident to the changing direction of the flow. This force affects all moving particles of the stream at right angles with their direction of flow, varying in magnitude with the third power of their velocities. The faster currents of the upper part of the stream are affected more strongly than the slower bottom currents and they are constantly directed toward the outer bank. This movement is compensated by undertow in the opposite direction so that the stream has a torsional or boring motion, as well as downstream flow, on bends. This torsional motion involves a downward migration of faster currents near the outer bank which brings currents capable of scour to greater depths on bends than that at which they are maintained on straight reaches or between bends where no centrifugal force is developed and flow is essentially parallel.

If discharge and load remain constant long enough, the channel depths become adjusted at all points to the relative intensities of centrifugal force and, correlatively, with the curvatures of bends, to give uniform erosional capacity throughout like reaches. When discharge increases, the erosional capacity of a bend increases more rapidly than that of adjacent crossings, and consequently scour occurs on all bends and filling on all crossings during a rise in stage, tending the re-establishment of uniform erosional capacity. When discharge decreases, the erosional capacity of a bend falls off more rapidly than that of the crossings and erosional readjustment involves filling on bends and scour on crossings. Crossing bars are thus built up during flood and are most troublesome to navigation after a sudden drop from a high stage.

Bank Cutting.—Bank cutting is also due to

centrifugal force incident to changing direction of flow. Currents capable of scour are constantly shifting to the outer banks of bends. The undertow in the opposite direction shifts the bottom load toward the inner bank. Thus the channel tends to shift outward on a bend by taking on load from the outer bank and depositing load along the inner bank.

Imperfect Drainage.—Flood plains of an aggrading stream slope downward away from the channel. Their elevation near the channel approximates high water level and in more remote areas may be at or even below the low water level of the adjacent channel. The drainage of the lowest areas, consisting of their own rainfall and the seepage and periodic overflow from the stream, finds its course down the valley parallel with the main stream, to join at some lower point as a distinct tributary. As the main stream is elevated in adjustment to delta growth, the drainage of flood plain areas that are not built up commensurately becomes more and more sluggish and may even become imperfect, to form permanent swamps that are characteristic features of the flood plain of broadly aggrading rivers.

Regularity of Grades.—Any unusual declivity in the stream's course makes the channel at that point subject to special erosional attack. This generally causes the elimination of all irregularities of grade early in the geologic life history or cycle of erosion of the stream. In terms of human experience, irregularities of grade suitable to power development are practically permanent, so that the natural processes working toward their elimination are negligible in relation to river engineering.

Present Methods of River Improvement.

—Low water discharge is increased by storage reservoirs that accumulate water during freshets and discharge it during the natural low water season, supplementing natural ground storage. Floods are prevented from spreading by levees built between the stream and the threatened areas, or from concentrating in trunk channels by detention reservoirs that store temporarily a part of excessive run-off. Shallow crossings are improved by dredging or the stream is forced to deepen itself across them by works that reduce its width. Banks are protected from scour by lining them with resistant material. Imperfect drainage is improved by ditching, diking and pumping. Water-power sites are developed by dams which afford artificial irregularities of grade.

Limitations of Present Methods of River Improvement.—Any of these works, if adequately contrived, will eliminate the specific fault to which it is applicable, but a work that does not affect the primary cause of a fault may give but temporary benefit. Works that disturb the natural equilibrium of erosional processes may excite vicious readjustments that end in detriment instead of improvement.

To dredge a navigable channel through a crossing bar is patently a temporary expedient, as it does not eliminate the play of centrifugal force in adjustment to which all crossings build up during flood. Contraction works for increasing crossing depths give a more persistent effect, but their use on all or many crossings impedes flow and causes deposition, adding to the height of levees required to restrain floods.

Levees built to sufficient height accomplish their immediate purpose of preventing the spread of water over the flood plains when discharge exceeds the drainage capacity of the channel. But they also restrain the sediment that would naturally escape from the channel with the flood waters. The retention of flood waters between the levees increases channel discharge above the natural and also erosional capacity. The retention of sediment increases load.

In natural streams crevasse waters commonly return to the channel after depositing their load. Levees, therefore, increase channel discharge locally only by the amount of natural crevasse water in that section of the valley, while load is increased at any point by the amount of sediment that, without levees, would have been vented through all upstream crevasses. The increase in erosional capacity of the channel due to levees varies from place to place but never exceeds a small fraction of the natural. The increase in load due to levees is cumulative down stream and in the lower reaches of a leveed stream it may equal or even be a multiple of the natural load. The readjustments of grade to increased load in the lower reaches involve deposition in and elevation of the channel. Also delta growth and elevation of the channel in adjustment to it are stimulated.

Bank protection by revetment or rip-rap suspends lateral scour. Concomitantly the re-assortment of flood-plain materials, which gives a progressively finer grained load and contributes to the gradual decrease in channel slope downstream, is eliminated. Therefore, an abnormal coarse-grained load must be carried through the lower reaches of a stream whose banks are generally protected. The readjustment of slope to this duty involves channel elevation and aggravation of flood heights.

The present methods of channel improvement, flood prevention and bank protection are of limited practicability. The persistence of benefit to navigation from dredging varies inversely with the erosional activity of the stream, and its profitable use is generally limited to lightly loaded streams and waterways where benefit to commerce outweighs a considerable annual expense. Contraction works to improve crossings can be logically used only where it is possible to offset their effects by adding to levee heights. Levees can give permanent protection from floods only where the height required to confine floods after grades become readjusted to all improvement works is within the limit of practical construction. General fixation of banks is permissible only when other factors affecting required levee heights leave a sufficient margin of practical construction for the grade readjustment which they entail.

The Future of River Improvement.

To gauge the future of river improvement one must look not to the past history of the art, but to the histories of other arts of early civilization that have assumed the stature of applied sciences. Chemistry, medicine, mining, metallurgy, agriculture—all practical sciences had their early foundations in primitive arts that had developed under pressure of economic need, representing man's physical adaptation to

external nature. With the advent of the modern scientific age the spirit of research swept beyond immediate physical need in a wide mental adaptation to external nature; persistent inquiry and experimentation built up pure sciences that became the soil in which the ancient arts grew to fruition in technical practices that are the foundation of modern living.

River engineering dates its inception far back in unwritten antiquity to irrigation and levee projects that are counted among the signs of earliest civilization. Down through all the succeeding ages there was little change in principle or practice for the simple and obvious works first invented were sufficient for the needs of small or isolated projects. When the needs of river improvement were multiplied in the course of industrial development it was natural for the same practices to be extended to larger and more general application without premonition of the more subtle and remote consequences. The first great expansion of river improvement works occurred in Europe in the last half of the 19th century. As it progressed and unexpected results developed it became apparent that the art was still in an experimental stage and that the problems involved not only the study of mobile hydraulic quantities and channel space but also the study of the intricate interrelations of erosional processes and physiographic forms.

This demonstration stimulated research and throughout Europe in the early years of the 20th century hydraulic laboratories were in operation. However, their efforts were mainly directed to local, practical difficulties rather than to general physiographic problems, so their results fell short of the ultimate need—the formulation of methods of unified treatment of entire river systems for complete development of water resources. The work of the European laboratories marks the farthest advance in the direct adaptation of means to necessity in river improvement, for American practice is modeled after the European. It remains to be seen how much this work has been curtailed and set back by the World War.

Entirely distinct from the physical adaptation to external nature represented in European progress in river improvement there has been developed in the last few decades, chiefly by Americans, the science of physiography which treats of topographic forms and the agencies that create them. Its subject matter includes the laws that underlie the agency of running water in the transportation and deposition of solid matter. When these principles are fully invoked to assist in the practical matters of river improvements a new day will have dawned upon the enterprise, a day like that enjoyed by the other arts that have intergrown with science until their basic problems are lifted above the field of speculation and controversy. When river improvement becomes the application of physiographic science, sure progress will be made toward complete and permanent utilization of water resources.

HENRY M. EAKIN.

RIVER FALLS, Wis., city in Pierce County, on the Kinnickinnick River and the Chicago and Northwestern Railroad, about 60 miles west of Eau Claire and about six miles from the Mississippi River. It was settled in 1850 by a colony from New York, incorpo-

rated in 1856 and chartered as a city in 1885. It is in a productive agricultural region, in which wheat is the principal crop. The chief manufacturing establishments are flour mills, wagon works and a starch factory. The trade is mostly in grain, flour and vegetables. The principal public buildings are the six churches and the schools. River Falls is the seat of a State normal school and a high school and has two graded schools. The bank has a capital of \$25,000. The government is vested in a mayor, elected biennially, and a council of six members elected annually. The city owns and operates the waterworks and the electric-light plant. Pop. about 1,991.

RIVER-HOG, one of the African wild swine of the genus *Potamocharus*, separated from the typical pigs (*Sus*) by the existence of a horny outgrowth from a bony protuberance above the canine in the male. This has been compared by Beddard to the osseous horn-cores of the extinct *Dinoceras*. Five species are recognized, one in Madagascar and the others in South and West Africa. The best known are the gray bushbark or bush-pig (*P. africanus*) of Cape Colony and the red river-hog (*P. porcus*) of the West Coast, remarkable for its vivid rufous coloring and long penciled ears. These pigs lead a half-aquatic life along the marshy borders of sluggish streams and in dense forests, but do great damage to the native plantations in some parts of the country, whence they are constantly killed off. Consult 'Proceedings,' Zoological Society, London 1894, p. 92.

RIVER REGULATION. See **HYDRAULIC ENGINEERING**.

RIVER ROUGE, roozh, Mich., village in Wayne County, on the Detroit River, five miles south of Detroit, on the Michigan Central and the Detroit and Toledo Shore railroads. Steel works and a shipping yard are located here. Pop. about 4,163.

RIVER-TERRACE. See **TERRACE**.

RIVERA, José Fructuoso, hō-sā' frook-too-ō'sō rē-vā'rā, Uruguayan soldier and politician: b. Paysandu, Uruguay, 1790; d. Montevideo, Uruguay, 13 Jan. 1854. He fought in the numerous civil wars, rose to leadership and when Uruguay established her independence became in 1830 first President of the republic. In 1835 he was succeeded by Oribe, and in 1836 headed a revolt against the President, which resulted in a civil war of two years' duration. Oribe was forced to resign, and in 1838-42 Rivera again served as President. In the latter year Oribe, aided by the Buenos Aires dictator, Rosas, invaded Uruguay and in 1843 began the famous nine years' siege of Montevideo. Rivera moved to meet him in the field, but in 1845 was defeated at India Muerta by Urquiza, an ally of Oribe. In 1853 Rivera aided Flores in deposing the recently elected President, Giro, and later became a member of the executive triumvirate.

RIVERHEAD, N. Y., village, county-seat of Suffolk County, on the Peconic River, at the head of navigation, and on the Long Island Railroad, 67 miles east of New York. The village was first settled in 1690, and its growth during the first century was slow; in 1729 it was made the county-seat. During the War of

1812 a skirmish between men from some British vessels and the American militia took place near the village and within the limits of the township. It has a variety of industrial establishments, including grist mills, a woolen mill, planing and molding mills, carriage works, soap factories and an organ manufactory. It contains the county courthouse, the agricultural fair buildings and grounds, and has a high school with a school library. Pop. about 4,706.

RIVERS (Fr., *rivière*; Span., *ribera*; It., *riviera*; Lat., *riparius*, from *ripa*, bank, of or belonging to a bank), bodies of water of considerable size flowing with perceptible currents in definite channels, and usually without cessation during the year. Some watercourses are designated as rivers, although their beds are dry a part of the year. Rivers, obeying the laws of gravity, seek the lowest level and eventually reach the ocean. The regions having rivers which do not flow into the ocean either directly or indirectly are parts of the earth's surface where the evaporation is so great that no overflow of water results from precipitation. Usually the overflow of a river discharges into another river, and perhaps a second or even a third discharge is made before the waters reach the sea. The Republican River of Nebraska and Kansas flows into the Kansas River in the State of Kansas, and the Kansas River flows into the Missouri, the Missouri into the Mississippi and the Mississippi into the Gulf of Mexico, which last discharges its waters into the Atlantic Ocean through Florida Strait and Yucatan Channel.

Origin.—Rivers are usually formed by springs or the gradual melting of the ice and snow which perpetually cover the summits of all the most elevated ranges of mountains upon the globe. Springs and ice are themselves due to the precipitation of water from the atmosphere in the form of snow, rain, mist or dew. These fill the springs, lakes or other reservoirs from which rivers flow by the natural gravitation of water to a low level. The union of various springs, or of these meltings, forms rivulets; these last follow the declivity of the ground and commonly fall at different stages into one great channel called a river, which at last discharges its waters into the sea or some great inland lake. A new-made river at first usually flows over the surface until it has worn itself a channel; or it may follow some depression or deformity in a mountainous region. Rivers are swollen during their course by the rain which falls on the surface. In temperate climates the source of supply tends to greater equality in the volume of the river than in torrid regions, where the evaporation is great. In the former the rains are not only more equally distributed in point of time, but also from a more protracted source of supply; part of the rainfall sinks into the ground and forms springs, part forms rills which flow directly into the river and part feeds those rills with the drainage of the saturated ground long after the rain has ceased. As mountainous regions abound in springs, most rivers begin from a chain of mountains; each side of a chain also has its springs, and the rivers which originate on one side flow in the opposite direction to those which rise on the other. As it is the property of water to follow the most precipitous descent that comes in its way the courses of

streams point out the various declivities of the earth's surface, and the line from which large rivers flow in contrary directions generally marks the highest parts of the earth. This line need not, however, be of any great height; in European Russia, for instance, where the rivers are very extensive, the line which separates their sources is very little above the level of the Baltic or of the Black Sea.

Changes in Form and Size.—As soon as the stream begins to flow, its channeling and the deepening of its trough commences. If no obstructions prevented, the water would go on enlarging the channel, by widening and deepening. The nature of the soil, the softness or hardness of the rocks along its course, the amount of sediment it carries in its waters and where this sediment is deposited all contribute to change of form and size. The erosive action of rivers on their beds is continually exercised, especially in the early part of their course; where the channel broadens as they approach the sea it may almost cease. Remarkable instances of erosive action are almost everywhere to be observed; but in no case is such action more striking than in the cañons or river-gorges in the Colorado region of the United States. There the rivers have hollowed out for themselves channels that present almost perpendicular rock walls on either side rising to the height of 6,000 feet for hundreds of miles. Such action is also seen where there is a waterfall, in which case the water gradually wears away the rock at the place where the fall occurs and thus causes the latter to recede, as Niagara Falls. In perhaps every case a river has had much to do with the formation of the valley in which it flows. Rivers are very permanent features in the earth's history, and in some cases have hollowed out a channel through a mountain range gradually elevated across their source.

The size of a river depends upon two main circumstances,—the extent and character of its drainage area, and the degree of humidity possessed by the climate of the region from which it draws its supplies,—the latter being often dependent upon prevalent winds blowing from the ocean. The peculiar position of the Andes Mountains with respect to the rest of South America, the fact that by very far the largest proportion of its running waters are drained off in one general direction, toward the Atlantic, and the humidity of the climate, all contribute to the immense size of the rivers. The Andes being placed so near the coast of the Pacific, the rivers which flow into the Pacific Ocean are small, while those which flow on the other side, having such an immense space to traverse, are increased into a vast volume before they reach the Atlantic. The physical conformations of some continents are unfavorable to the accumulation of such vast bodies of water as the rivers of South America. Europe is not of sufficient extent; Africa has a climate which causes rapid evaporation and abounds in sandy deserts. A large part of Asia has not the humidity of the Amazon region, and its vast interior lakes serve as receivers for some of the large streams. The arrangements of its mountains conduce to long and somewhat narrow drainage areas. As the river goes on from year to year, in most cases it cuts a trench below the original constructional channel, and it

time forms what is called a consequent valley. By means of the new constructional troughs many of the constructional lakes and the rivers become continuous streams, that increase the length as well as the depth of the channel. Where the waters pass from a hard to a soft rock, or from a resistant to a weak part of the material through which it is channeling, a greater slope is formed making rapids (q.v.) or falls, or cascades (q.v.). The angle of the slope depends upon the difference in the degree of resistance of the hard rock in the old channel as compared with the soft rock in the formation channel. Gradually the channel is cut down close to the sea-level or base-level, and its course is over a gentle, gradual slope. The depth of the channel depends upon the dryness of the climate, softness of the rock, height of the land and the volume of the stream. The dry climate really lessens the volume of the stream, and consequently it cannot force its way with the rapidity of a stream with greater volume even if the widths of the channels are equal. The river flowing through a region of hard rock will cut a deeper valley in a given time than the river of the same size and volume flowing through a region of soft rock; the latter will have a mass of detritus, an accumulation of waste from the weak rock, and it will need a vast volume of water or a steep grade to do the same amount of channeling as the first-mentioned river. Rivers flowing over comparatively low land, with drainage areas not much above the base-level, have shallow channels, as in the southeastern part of the United States, especially in Florida. A river with a large volume of water has more power to carry off sediment, and even where the slope is gentle its momentum is greater than in that of the stream with a small volume of water. There are two causes for the shallow channels of the long rivers of the plains east of the Rocky Mountains—the dryness of the climate and the soft rock material through which they pass.

After a river has cut its channel to the base-line, then its grading really begins, the inequalities gradually disappear, or would disappear if there were no obstructions to the regular work. The constructional lakes and the waterfalls gradually disappear. The constructional lakes may disappear, but if the amount of detritus is large the channels lower down a stream, with a slight grade, may be filled, and thus the water will flow over a bed elevated above what was once its channel. Such channels exist in Ohio and in the plains of Lombardy. Any change in the depression or uplift of the land, whether from volcanic or other causes, will produce some change in the river. In various parts of Europe and the eastern part of North America rivers have changed because of increase of evaporation caused by the continued deforestation of their basins. New tributary rivers appear in the drainage area of a well-defined river. The valleys formed by such streams are called subsequent valleys and the streams themselves are called subsequent streams.

The main stream with all the lateral streams and all tributaries, whether lakes or rivers, is called a river system. The land drained by a river system is called its basin. The system is usually known by the name of the main stream or trunk.

The rate of fall of many of the large rivers

is not great. The Amazon has a descent of only $10\frac{1}{2}$ feet in 600 miles of its course—that is, one twenty-seventh part of an inch for every 1,000 feet of that distance. The Loire, in France, between Pouilly and Briare, falls one foot in 7,500 feet, but between Briare and Orleans only one foot in 13,596 feet. Even the rapid Rhine has a descent of no more than four feet in one mile between Schaffhausen and Strassburg, and of two feet between the latter place and the borders of Holland. The glaciers in France show a change in volume and a consequent change in the size and rate of fall of the glacier-fed rivers. See NIAGARA FALLS; WATERFALLS.

Watersheds or Divides.—The line which separates the waters which flow into different rivers or different systems is called the watershed or the divide. The continental divide in the United States is the line which parts or separates the streams which flow into the Pacific from those which flow into the Gulf of Mexico through the Mississippi. Divides change from various causes. The subsequent rivers sometimes take the water from one system to another. The gradual removal of a constructional lake may change the divide, as in New York State between the Mohawk River and Lake Ontario; in the Northwest, between the Red River of the North and the Mississippi. The divides in many places are very low, as between the Amazon and Orinoco and the Amazon and the Paraguay. The Orinoco at some distant period reached the basin of the Amazon, and has been subsequently connected with it through what is now an important branch, the Cassiquiare, which after a course of 120 miles from the main river discharges itself into the Rio Negro, a branch of the Amazon; and as the navigable waters of the Amazon approach within three miles to those of the Paraguay there is with only this interruption a continuous communication by navigable rivers from the mouth of the Orinoco, in lat. 9° N., to the mouth of the Paraguay, in lat. 35° S.

Flood-Plains.—For various reasons many rivers overflow their banks at annual periods, others at irregular intervals. Such rivers usually carry a large amount of silt which at the time of an overflow is deposited on the land, thus enriching it. Great damage sometimes results from this overflow (see LEVEE; MISSISSIPPI), and various means have been devised to protect the lands adjacent to such rivers from inundation. The flood-plains of the Nile are noted for their fertility; the Mississippi, Amazon, Ganges and many others have extensive flood-plains. The large rivers of Siberia have vast flood-plains caused by the thaws at the sources of the rivers when the lower portions are closed by ice. The descending waters sweep over the frozen surface carrying with them vast quantities of soil, detritus and even forests. The Mackenzie in North America has flood-plains from the same sources as the Siberian rivers.

Mouths of Rivers.—The river which enters the ocean may have its channel submerged and the mouth becomes an estuary or a fiord. In either case there is a constant battle for supremacy between the fresh water from the land-mass and the salt waters of the sea. Some of the sediment of the rivers is brought to the sea and either carried out into the ocean or

deposited at the mouth of the river, where it forms deltas. In some cases, as the Mississippi, the delta grows rapidly, extends out into the sea and becomes a part of the land-mass. The sediment annually brought down the Mississippi has been estimated as equal to a deposit of a foot in thickness over 12 square miles. The waters of the Ganges and Brahmaputra come more highly charged with sediment on account of their more rapid descent and the more violent rains that fall about their sources, and their deposits exceed many times those of the Mississippi. The sediments are spread out to a distance of 100 miles or more from the land, the waters of the Bay of Bengal being discolored by them even at this great distance. The quantity annually discharged from the mouth of the river has been computed equal to a layer one foot thick over a tract of 225 square miles. The Nile has a vast delta. The Mississippi, Nile, Ganges, Po and many other rivers enter the sea by several channels. The Amazon enters by only one large channel, divided by an island, but the river broadens out into a bay 180 miles wide. The delta-lands are very fertile, and where the river channels have assumed stability, deltas have become valuable additions to the land-mass.

Economic Relation of Rivers.—The effect rivers have in supplying moisture to the adjacent lands, either by natural or artificial (irrigation) means, is recognized by all nations. Their uses as contributing to the healthfulness of the climate and to modifications of temperature are well known. In the early history of all the nations on the globe, the waterways were the great thoroughfares which furnished means of intercommunication, and the rivers were largely instrumental in determining the location of the important commercial and industrial centres of the world. The great rivers of Europe and Asia, such as the Rhine, Danube, Volga, Indus, Ganges, Brahmaputra, Yangtse and Ob afford enormous populations access to the sea. The Amazon, with its plain track extending for nearly 3,000 miles, is in many ways less like a river than a fresh inland sea; but the Mississippi and Saint Lawrence, though less extensive, are of greater value for carrying sea traffic to inland places. In their upper valley tracts, rivers are of use chiefly for transporting timber and driving machinery. It is interesting to note that in Switzerland, Norway and Sweden, where there is no coal, there exist exceptional facilities for the use of water power on account of numerous mountain torrents.

LAW OF RIVERS.

General.—In law a body of water having a uniform current is generally termed a river. It consists of the bed, the water and the banks or shores according as the stream is non-tidal or tidal. The law applicable to rivers and their use depends upon the country having jurisdiction over them. In the United States the use of navigable rivers is regulated by the laws of the United States and by the legislatures of the States through which they flow. No general statement that is applicable to all streams, and which governs the use of all streams, can be made, and navigable and unnavigable rivers are not always subject to the same rules. In the United States, in the most

approved and important sense of the term, navigable waters include all those having a channel which is useful for commerce. Such waters are public highways by common right. It has been said in construing the common law and in some of the earlier decisions of the courts that by navigable waters are meant all those in which there is a flow or reflow of the tide. This definition may have been proper in England where there is no river of any considerable importance which has not a flow of the tide, but it would be unreasonable, in fact it cannot be applied, in the United States where there are large rivers like the Mississippi, the Ohio, the Allegheny, the Delaware, the Hudson, the Schuylkill, the Missouri, the Columbia and others that are very important for the purposes of navigation, and over which large business interests are transacted. To be navigable rivers, in the legal sense, commerce must be carried on over them which is of a valuable character. It is not necessary, however, that this commerce be carried on by means of boats; waters over which valuable commerce can be carried on are public highways for the purpose, even if they are used only for floating logs and rafts. Most of the authorities in America limit the term navigable waters to waters having an inherent capacity for navigation. Whether a river is navigable or not is generally a conclusion of fact and can be established by proof; but the courts in some States take judicial notice of the fact that some streams are navigable. In common law a distinction was made between waters navigable in law and those navigable in fact; those navigable in law being tide waters. The term is still used in this sense in England. By the civil law, waters that are in fact navigable are such in law, and a navigable river is defined as a *status itinere navigio* (a place or way for navigation). In the development of American law the tendency of the courts has been toward the adoption of the civil-law doctrines. Among navigable waters are two classes, termed Public and Semi-Public. The basis of classification is ownership. In public waters the soil beneath them is common property. The public have the right of navigation and all rights incident to ownership. Among them are fishing, gathering ice, sea-weed, sand, gravel, etc. All tide waters, including the sea and its arms and tidal rivers, belong to this class, and in many of the States all fresh-water rivers and lakes which have a capacity for valuable floatage are public. The non-tidal waters and the soil under them are private property, although the interest of the owner is qualified by being subject to the right of the public to pass over them.

Jurisdiction.—The right of navigation is subject to the control of the government, and the government has the right to improve rivers and harbors. In England this power was vested in Parliament. In the United States the authority of Congress under the commercial clause of the Constitution is paramount. In the absence of Congressional action, the power of the State legislatures is supreme; they may direct the improvements of navigable rivers, and may authorize improvements by individuals and by private corporations, and may levy tolls. Waters which lie within the borders of different States are generally subject to the con-

current jurisdiction of the States. The territory of States and nations when bounded by rivers extends, unless otherwise agreed upon, to the centre of the streams.

Public Easement of Passage.—The public have the right of passage over all streams which have a capacity for that purpose, and this includes the right of navigation in boats and vessels, and of floatage as in the case of rafts and logs, and of travel over the ice. In common law the right to navigate waters above the tide was acquired by using the same. Now it may be granted by express act of legislature, but it is generally regarded as an inherent public right needing no legislative sanction. The legislatures of the States having jurisdiction and Congress may make rivers and streams public highways for particular purposes when they are not public highways or navigable for other purposes. For instance, the legislature may make a river a public highway for the purpose of floating logs, although it cannot be navigated by boats or vessels.

Use of Banks and Shores.—By the civil law the public have the right to use banks and shores of navigable rivers as appurtenant to the right of passage, and this is true of the States where that system prevails; but under the common law the right to use the shores and banks by navigators was limited to high water mark and the right to pass over the waters does not include the use of banks for general purposes. But the public have the right of anchoring and of mooring on the banks against all except the owners of the banks. There is no public right at common law of towing on the banks. The owners of stranded property may go upon the banks for the purpose of taking it. In the use of rivers for navigation, the boats going down stream have a right to the centre of the stream or the centre of the current, and those going up stream must keep to the sides in passing. A descending boat may keep to the shore, but if she meets an ascending boat hugging the same shore and signaling her intention of keeping the shore, the boat going down stream must keep to the middle of the river. The rule is for the protection of vessels navigating up and down rivers crowded with boats to hold to the centre as nearly as possible. The rule both of statute and the general laws of navigation, which requires steamboats approaching one another to turn to the right, applies to steamboats crossing a river, and ferryboats crossing rivers making frequent trips are obliged to use great care to avoid other sailing craft. Steamboats must keep out of the way of barges and flat boats floating down the river guided only by oars.

Rivers not Navigable — Rights of owners.—When a river that is not navigable forms the boundary of property, one-half usually belongs to one proprietor and the other half to the other, the centre of the stream being the line between the owners of the lands on each side, and when the land on both sides belongs to one owner he is then the owner of the whole bed of the stream. This rule of law refers to the land under the water, and it is the property of the riparian owner as much as the banks of the river. The owner of the land has not an absolute ownership of the water, but he can use it for necessary purposes, as for the use of

his family and house and to water his stock. If he takes more than the usual quantity and for such purposes as are not necessary, he is liable for damages to riparian owners farther down the stream in case they suffer damages. One owner of the land cannot change the bed of the stream to the injury of other owners; but if the line be changed slowly by accretion at one side, the line of ownership will still follow the centre of the stream. The rule might be different if, for any unforeseen and uncontrollable cause, the stream should burst its banks and make a new channel in a different place.

Accretions.—The owner of the land along the side of and under a river has the right to all deposits of alluvium along and upon his land. If an island is formed by accretions in an unnavigable stream, the ownership will be determined by the *filum aquæ*, or centre of the stream, and it will belong to the persons owning the land on the side of the line on which it is formed. If the island is on the line, each will own his proportionate share.

Bridges.—Congress has power to authorize the erection of bridges over navigable rivers; the power may be exercised and authority given even when the bridges obstruct to a certain extent the free navigation of the rivers. States also have power to authorize the building of bridges over navigable waters within their boundaries, although they may to a certain extent interfere with navigation. This power in the States, however, is subject to the exercise of the power of Congress to regulate navigation. The proposition has come to be recognized as not disputable that, but for the power granted by the Constitution to Congress, the State legislatures would have as full and entire control of the waters of their several States as they have over the land. The States reserve all power not granted to Congress. The sovereignty over the waters of the States vests in Congress and in the several State legislatures. Congress and the State legislatures can provide for the erection and maintenance of draw-bridges over navigable rivers, and provide for the safe passage of vessels in the draws.

Boundaries.—When land along the bank of a river is described as being bounded on the bank or shore, instead of the centre of the stream, then low-water mark on the shore will usually be the boundary line. Where land is bounded by a common law navigable stream, that is, one in which the tide ebbs and flows, the boundary is the high-water mark on the shore, and in some States in which there are large rivers that are navigable, although the tide does not ebb and flow, the boundary line is held to be low-water mark. The proprietor has a right, subject to government supervision, to erect wharves and piers extending to low-water mark or into the channel of the stream. In deciding what is low-water mark, the ordinary rise and fall of the water is taken into account. There is not a unanimity of legal opinion in all the States upon the subject of the ownership of the beds of streams.

Dams.—The owner of land on both sides of a stream not navigable may erect a dam and swell the water of the stream or form a pond up to the line of the land of the next owner up the stream. An owner of but one bank can-

not, without permission, erect a dam beyond the thread of the river. The erection of dams has been encouraged by the legislatures in many of the States on the ground of public policy. The right to erect dams has been given to riparian owners even when they flow the lands above them, and in some cases permission has been given to riparian owners to erect dams across the stream, although they owned land only upon one side. In these cases the statutes authorizing the erection of such dams have provided the method of assessing and collecting damages. Riparian owners on navigable streams, whether navigable by nature, or declared to be public highways by the legislatures of the States through which they flow, cannot erect dams across such streams without permission of the legislature having jurisdiction, or Congress. This permission is granted in some States by general law, and in others, as in New York, by special laws. The legislatures in granting permission to erect dams always provide for ordinary navigation and for the maintenance of fishways. The right given by legislatures and by Congress to erect dams is not a protection against injuries to private owners. Such owners have a right to collect damages.

Ferries.—A ferry franchise is a right to transport passengers and property across a stream and to land at a particular place on its bank. In the United States this right is established by legislative authority. It is the creature of a sovereign power and no one can exercise it without the consent of the State. It is within the control of the government. In England the right was granted by the Crown, or founded upon prescription. A ferry franchise is real estate and can be sold like any other real estate.

Fishing.—Ordinarily any person may take fish out of navigable streams if he can do so without trespassing upon the lands of private owners. In most of the States of the United States as at common law, the exclusive right to fish is in the owners of the banks of rivers that are not navigable unless otherwise appropriated by statute. This right, however, is subject to legislative control. The preservation of fish in the waters of a State is of such public concern as to fall within the domain of legislative power. No owners of land have the right to obstruct the free passage of fish up and down the streams. The legislatures have the right to regulate the taking of fish from private rivers, which are unquestionably private property.

Floods.—Riparian owners who collect water on their land must keep such water under control at their peril, and dams erected for the purpose of confining water or creating ponds must be constructed with such care and skill as to make them capable of resisting usual and ordinary floods.

Ice.—Water congealed is ice. Ice formed upon private waters, and that includes rivers owned by individuals, is real estate and is the property of the owner of the soil over which it is formed. In some of the States, however, as in Michigan, it is held as personal property and can be sold as personal property. After it is cut and removed it is always personal property. The owners of land bordering upon navigable streams in States where they are held to be public property, have no title to the ice which forms on such streams; such ice

belongs to the first person who appropriates it, but generally ice forming upon private freshwater streams belongs exclusively to the riparian proprietors and they may prevent others from removing it and maintain trespass against those who cut it without permission.

Irrigation.—The right to take water from streams passing over land owned by individuals is regulated by law, and differs in different States. The right, however, is generally recognized that there may be a reasonable appropriation, but no total diversion of the water.

When the State or the government intervenes and takes control of rivers for the purposes of irrigation, then the streams are to be used according to the laws enacted for the purpose. This is so as to the use of all rivers that can be used for the general good of the public. The courts have jurisdiction over questions arising out of the use of rivers. The United States admiralty courts have jurisdiction over causes of action arising in the large rivers as they do in the Great Lakes and the sea and coast waters.

Bibliography.—Lawson, 'Geography of River Systems'; Napier, 'Lakes and Rivers'; Ruffner, 'Non-Tidal Rivers of the United States'; Russel, 'Rivers of North America'; Wheeler, 'Tidal Rivers'; Morrill, 'Floods of the Mississippi River'; Edward, 'Thousand Miles up the Nile'; Keller, 'Amazon and Madeira Rivers.'

RIVERSIDE, Cal., city and county-seat of Riverside County, on the Santa Fe, Southern Pacific, Salt Lake and Pacific Electric railroads, about 60 miles east of Los Angeles. It was founded in 1870 by settlers largely from the New England States and New York, and was incorporated as a city in 1886.

Riverside is famous as one of the largest citrus producing and shipping points in the world, the annual output of the citrus fruits in Riverside County being over 6,000 cars, of which something over 1,000 cars are lemons, the balance being oranges. There are over 20 packing-houses in the city where oranges and lemons are shipped, employing over 1,000 persons at the height of the season. Alfalfa and deciduous fruits are also successfully grown, and there is a large grain-producing area in the county. There are three large fruit canneries in the city. Cotton is extensively grown in the Palo Verde Valley in Riverside County and the only place in the United States where dates are grown in a commercial way is in the Coachella Valley in Riverside County.

Riverside has one of the most extensive and complete irrigation systems in southern California. The climate is remarkably healthful and the place is famous as a health resort. The architecture of the public buildings has been largely developed along Mission lines, and among the famous buildings of this character are the Glenwood Mission Inn, the Carnegie library and the Girls' High School building. The courthouse is a single-story structure built along classic lines, and cost \$250,000. Riverside is the seat of Sherman Institute, a United States Indian School, which has over 600 pupils, and of March field, an army aviation post.

There are four banks with deposits of over \$7,000,000. The government of the city is vested in a mayor and city council of six members. Pop. 20,000.

RIVES, revz, Alfred Landon, American engineer, son of William Cabell Rives (q.v.) and father of Amélie Rives: b. Paris, France, 25 March 1830; d. 1903. He was educated at the University of Virginia and at the École des Ponts et Chaussées, Paris, where he was graduated in 1854. He was assistant engineer in completing the capitol at Washington, was engaged on the aqueduct there, and later was in charge of the United States survey for improving the Potomac River. He was colonel of engineers in the Confederate army during the Civil War, and was afterward manager of various railways and engineering enterprises.

RIVES, Amélie. See TROUBETZKOY, A. R.

RIVES, George Lockhart, American lawyer and historian: b. New York, 1 May 1849; d. 18 Aug. 1917. He was educated at Columbia University and Trinity College, Cambridge, England; and was admitted to the bar of New York in 1874. He engaged in practice in New York, and in 1887-89 was Assistant Secretary of State in the Cleveland administration. He was president of the commission to revise the Greater New York Charter in 1900; was a trustee of Columbia University from 1882 and a trustee of the New York Public Library after 1895, serving as president of the board from 1914. 'Author of 'The United States and Mexico, 1821-48' (2 vols. 1913).

RIVES-WHEELER, Hallie Erminie, American novelist: b. Christian County, Ky., 2 May 1876. She has published 'Smoking Flax' (1896); 'As the Hart Panteth' (1896); 'A Furnace of Earth' (1900); 'Hearts Courageous' (1902); 'The Castaway' (1904); 'Satan Sanderson' (1907); 'The Kingdom of Slender Swords' (1909); 'The Valiants of Virginia' (1912); 'The Long Lane's Turning' (1916).

RIVES, William Cabell, American legislator and diplomat: b. Nelson County, Va., 4 May 1793; d. near Charlottesville, Va., 26 April 1868. He was educated at Hampden-Sidney and William and Mary colleges, studied law, and in 1816 was a member of the Virginia constitutional convention. In 1817-19 and in 1822 he served in the State legislature, and in 1823-29 was a member of Congress. He was Minister to France in 1829-32, and in that capacity negotiated the treaty indemnity in 1831. He served in the United States Senate in 1832-34, 1835-45, and in 1849-53 was again Minister to France. He was a member of the peace conference at Washington in 1861, and after the secession of the South sat in the Provisional Congress at Montgomery, Ala. He published 'Life and Times of James Madison' (1859-69); 'The Life and Character of John Hampden' (1845); 'Ethics of Christianity' (1855).

RIVETING MACHINES. See METAL WORKING MACHINERY.

RIVIERA, rê-vê-â-râ, a district bordering the Mediterranean Coast, partly in France, partly in Italy, with Genoa as its central point. It extends to Spezzia on the east and Nice on the west, and is a favorite winter resort of invalids and others. The whole coast is traversed by a road and by a railway.

RIVIÈRE, rê-vê-âr, Briton, English painter of animals: b. London, England, 14 Aug. 1840. He studied art under his father, a drawing master, worked at illustrating for many

English and American publications and exhibited at the Royal Academy for the first time in 1858. He was elected A. R. A. in 1878 and R. A. in 1881. Among his most notable pictures, many of which have been engraved, are 'Strayed from the Flock'; 'The Lost Sheep'; 'Legend of Saint Patrick'; 'An Anxious Moment'; 'Circe'; 'Giants at Play'; 'Actæon'; 'Vae Victis'; 'Rizpah'; 'A Fool and His Folly'; 'Daniel' (1872); 'Sympathy' (1878), and 'Miracle of the Gadarene Swine' (1883), which are found in the Tate Gallery; 'Persepolis' (1878), considered his masterpiece; 'In Manus Tuas Domine' (1879); 'A Mighty Hunter before the Lord' (1891); 'Beyond Man's Footsteps' (1894, also in the Tate Gallery); 'Hark, Hark, the Lark' (1909). He is also known as a sculptor by his 'Anatomical Lion' (1888); 'A Dying King' (a lion, 1894), and 'The Last Arrow' (a lion-hunting scene, 1896).

RIVIÈRE DU LOUP, rê-vê-âr dü loo. See LOUISEVILLE.

RIVINGTON, James, American printer: b. London, about 1724; d. New York, 4 July 1802. Early in life he was a bookseller in London, but in 1760 came to America and opened a shop in Philadelphia, then in 1761 established himself in New York, and on 22 April 1773 began the publication of a newspaper entitled the *New York Gazetteer, or the Connecticut, New Jersey, Hudson River and Quebec Advertiser*. It was Royalist in sympathies and circulated among the Tories and gave to its publisher a position of some prominence. His affairs seem to have been under investigation by both the Provincial and Continental Congresses, and he himself was placed in temporary confinement. In November 1775, in consequence of his constant assaults upon the patriots, and especially Captain Sears, that officer came from Connecticut with a company of horsemen, proceeded to Rivington's printing office, destroyed the press and converted the types into bullets. Rivington then went to England, and being appointed king's printer in New York, returned with a new press after the city had fallen into the hands of the British, and in October 1777 resumed the publication of his paper under the old title, soon changed to *Rivington's New York Loyal Gazette*, and on 13 December to the *Royal Gazette*. About 1781, when the success of the British was becoming very doubtful, he played the part of a spy, furnishing Washington with important information. When, therefore, New York was evacuated Rivington remained in the city and changed the title of his paper to *Rivington's New York Gazette and Universal Advertiser*. The paper finally suspended publication in 1783, and he passed the remainder of his life in comparative poverty.

RIVOIRE, rê'vwar', André, French poet and playwright: b. Vienne, Isère, 1872. He was educated at the Lycée Henri IV, became a collaborator on *La Revue de Paris* and was elected a Chevalier of the Legion of Honor. He occupies a foremost place among the younger French poets and has been equally successful as a dramatist. Author of 'Les vierges' (1895); 'Le songe d'amour' (1900); 'Le chemin de l'oubli' (1904); and the dramas 'La peur de souffrir' (1899); 'Il était une bergère' (1905); 'Le bon roi Dagobert'

(1908); 'Mon ami Teddy' (1910); 'The Little Shepherdess' (1915); 'L'humble offrande' (1916), etc.

RIX, Julian, American painter: b. Peacham, Vt., 1850; d. New York, 24 Nov. 1903. He used to say that he was "a pupil of nature," and appears to have had no regular academic training. He came to New York in 1888, and his work immediately attracted attention by its marked personal qualities. His California landscapes have been familiar ever since to all visitors to the exhibitions. His best paintings, among which are scenes in the Maine woods, were produced during the last five years of his life. Among those found in private collections in New York, Rochester and Baltimore, are 'Sunset, California Coast'; 'High Tide, Coast of Maine'; 'The Woodland Spring, Mike Marr's Camp, Moosehead, Maine'; 'Breezy Afternoon'; 'Solitude'; 'Old Oaks'; 'Twin Oaks'; 'Noon-day'; 'A Breezy Day'; 'St. John Harbor.'

RIX DOLLAR, the English way of writing the names of different silver coins used in various European countries, as the *rigsdaler* of Denmark = 53 cents; the Swedish *riksdaler* = 27 cents.

RIZAL, José, hō-sā' rē-thāl', Filipino patriot and author: b. Calamba, province of La Laguna, Luzon; d. Manila, 30 Dec. 1896. He studied medicine at Manila, and was graduated from the University of Madrid as doctor in medicine and philosophy; studied further in Paris, Heidelberg, Leipzig and Berlin; made researches in philology and ethnology; and was elected a member of the Berlin Anthropological Society. Having returned to the Philippines, he was soon compelled to emigrate, owing to the hatred visited upon him by the old Spanish party on account of his story, 'Noli Me Tangere,' descriptive of political conditions in the Philippines. He then resided in Japan, North America and London, where he prepared an edition of Morga's 'Sucesos de las Islas Filipinas,' originally printed in Mexico in 1609. On the continent he wrote another political novel, 'El Filibusterismo.' Subsequently he practised medicine at Hong-kong and went to North Borneo, where he purposed to establish an agricultural colony of Filipinos. Though he had obtained permission to visit the Philippines, he was arrested on arrival there, and banished to Dapitan. On the outbreak of the native insurrection against Spain, he was accused of being its instigator; and on a third trial was condemned and shot. The proceedings against him have been described as farcical. He was undoubtedly the most talented Filipino of recent times.

RIZAL, Philippines, a province of the island of Luzon, formed by the consolidation of the former province of Manila (excepting the city of Manila) and the district of Morong, bounded on the east by the province of Infanta and the Bay Lagoon, and on the west by the Bay of Manila; area, 1,026 square miles. The surface, except that part of the former province of Manila which lies south of the Pasig River (q.v.), is mountainous, traversed by a number of short irregular ranges. There are many plains which, though fertile, are often inundated by the Bay Lagoon to the destruction

of crops. In the western part of the province, the betel is grown extensively, especially in the vicinity of the town of Pasay; other products of the province are rice, sugar, corn and tobacco; there are also extensive forests. A fine variety of building stone is quarried on the island of Talim, in the Bay Lagoon. The industries other than agriculture include lumbering, fishing and the manufacture of lime, mats and clothing for native wear. The trade of the province naturally concentrates at the city of Manila, and the railroad from Manila to Dagupan, numerous roads and the waters of the Bay Lagoon and the Pasig River provide means of communication between the different parts of Rizal and Manila. The province was created and civil government instituted in June 1901. Pop. 246,940.

RIZZIO, David. See **RICCIO, DAVID**.

RIZZO, Antonio. See **RICCIO, ANTONIO**.

ROACH, rôch, John, American shipbuilder: b. Mitchelstown, Ireland, 1815; d. New York, 10 Jan. 1887. He came to this country in 1829, obtained employment in various iron works and foundries, became a machinist and finally erected a foundry of his own. Later he established the *Ætna Iron Works*, where he constructed the first compound engines built in the United States, and also built the largest engines which had been made in the country at that time. In 1871 he purchased the Rainer shipyards at Chester, Pa., enlarged the establishment until its value was estimated at \$2,000,000, and under the name of the Delaware River Iron Shipbuilding and Engine Works, of which he was entire owner, built a large number of merchantmen and also constructed the first ships for the new United States navy, among them the cruisers *Atlanta*, *Boston* and *Chicago*, and the despatch-boat *Dolphin*.

ROACH, a small European fresh-water fish (*Leuciscus rutila*), of the family *Cyprinidae*, related to the dace, chub, etc., and a favorite of anglers, because so much skill is needed in hooking it. It rarely weighs more than a pound, and is grayish or bluish green on the upper parts, lightening into lustrous white on the abdomen.

ROACH, an insect. See **COCKROACH**.

ROAD-RUNNER, one of the English names of a species of ground-cuckoo (*Geococcyx californianus*), so called from the chaparral or somb, which it inhabits. A remarkable bird which Coues aptly describes as a "cuckoo compounded of a chicken and a magpie," having a length of about two feet, of which a half is tall, very short wings, powerful legs, and feet of the cuckoo type, a rather long bill and crested head. The colors are changing and varied bronzes, dark steel blue on the head; everywhere except on the rump streaked with white and tawny; underparts soiled whitish, streaked with black on the throat, breast and sides. The chaparral-cock inhabits northern Mexico and southwestern United States, while a second related species is confined to Mexico. When pursued it seldom flies, but runs with great speed with upraised wings. Like other American cuckoos it builds a flimsy nest of twigs, in which six or more white eggs are laid at intervals. In feeding both animal and vegetable matter are partaken of. They are sometimes domesti-

cated and trained to catch mice and other house pests. Other names applied to this bird are road-runner, ground-cuckoo, paisano and snake-killer, each of which suggests one of the peculiarities of the bird. See Cuckoo.

ROADS AND HIGHWAYS. Historical Review.—Road building requires community action of a fairly high order. Savage man built no roads nor had he any conscious need for them. His wants were few and of an individual character. Gradually, however, as he mounted the ladder of civilization his wants increased both individually and collectively. The game trail and natural path became inadequate for travel, commerce and the movement and supply of armed forces.

When and where man first began to build roads we do not know. That it was long before the beginning of authentic history is certain. Dense populations and large cities are

2000 B.C. These roads extended to Susa, Ecbatana, Sardis and Nineveh. Strabo even speaks of the road between Babylon and Nineveh as being paved with brick laid in a mortar of asphaltum.

The ancient Persians, Assyrians, Carthaginians, Chinese and Peruvians were all great road builders. Their works, however, have all passed into decay and the records of their achievements lost or largely forgotten.

The Romans are the first systematic road builders of which we have definite knowledge.

The Building of the Roman Roads (allegorical engraving from an old print).

impossible without roads. Furthermore the construction of such works as the pyramids of Egypt and the "great walls and hanging gardens" of Babylon could not have been accomplished without the existence of roads for the transportation of materials and supplies.

Herodotus tells us that in Egypt a "Great King" built a magnificent road across the sands for the transportation of the materials for the "Great Pyramid," employing for this purpose 100,000 men for a period of 10 years. This road, 10 feet thick in places, was built of massive stone blocks and lined on both sides with mausoleums, temples and statues. Traces of what may be a part of this road are found near the "Great Pyramid," probably the oldest authentic remains of a road surfaced with stone. Early historians speak of wonderful roads radiating from Babylon on or before

Evolution of Road Construction.

The first of the great Roman roads, generally known as the "Appian Way" or "Queen of Roads," was begun by Claudius Appian about 312 B.C., and led from Rome to Capua, a distance of 142 Italian miles. This road was later extended to Brundisium (Brindisi), a total distance of 360 miles, and was probably finally completed by Julius Caesar. The "Flaminian Way," the second of the great Roman roads, was begun about 220 B.C. This road crossed the river Nar about 60 miles from Rome by means of a great stone-arch bridge with a

central span of 150 feet and a rise of 100 feet. After the completion of the "Flaminian Way" road building progressed very rapidly so that when Rome reached the height of her glory no less than 29 great roads radiated from her gates. Every conquered province was soon traversed with connecting roads and the entire Roman road system of main or military roads is estimated to have amounted to 50,000 miles.

The construction of the main Roman roads was extremely massive, consisting of four courses having a total thickness of about three feet and generally a width of from 16 to 32 feet or more. The foundation course of *statumen* was composed of large flat stones bedded in mortar. On this foundation was placed the *rudus*, a layer of hand rock laid in a form of lime or cement mortar. The *nucleus* consisted of small stones, gravel or pieces of brick and broken tile, laid in mortar. On top of this was placed the *summa crusta*, or wearing surface, of large, flat, closely-joined stones, making the total depth of the road about three feet.

The highway legislation of the Romans forms the basis for many of our present road laws. By the Roman law the right of the use of the roads was inherent in the public. The roads could be the property of no one, while the emperors or other chief magistrates were their conservators. The majority of the great highways were built by contract at the public expense. A few, however, were built, at least in part, from the spoils of war, the private munificence of emperors or great personages ambitious for public approval and acclaim. Their maintenance was in part by the labor of soldiers and slaves, or by enforced labor, which sometimes took the form of taxation. But, in whatever form the maintenance was made, it was at the expense of the district through which the road passed. The local or vicinal roads were committed to the charge of the local magistrate and as a rule maintained by compulsory labor or the contributions of the whole neighborhood.

In England, following the old Roman law, the "King's Highway" early came to represent a perpetual legal and customary right of passage, residing in the sovereign, for himself and his subjects over another's land. The maintenance of the road at first devolved on the Lord of the Manor, then for many centuries on the parish and now on the district and county councils. In the United States the public road has come to represent a definite strip or area of land owned and maintained by the public for public passage and such additional uses as may be determined by statute.

With the fall of the Roman Empire its magnificent system of roads began to decay and as a result of the following thousand years of neglect ceased to exist. Not until about the close of the Middle Ages did road building begin to revive and then not in Italy but in England and France. In 1597 Sully was appointed "Grand Voyer" of France and slow but definite improvement of the roads was begun. Broken stone began to be used extensively for surfacing during his Ministry.

In 1661 when Colbert became Comptroller of Finance he extended the feudal system of compulsory labor called the "corvée" so as to compel every able-bodied rural peasant, to-

gether with his work animals, to labor on the road or in the production of road materials as many days as the king, at the request of his Comptroller, might decree. By this means 15,000 miles of main roads were surfaced with broken stone. This work, however, imposed a fearful hardship on the peasants and was accompanied by the gravest abuses and caused the greatest discontent. Nevertheless the system of the "corvée" was continued with the greatest rigor until 1774 and was not entirely abolished until 1787.

About 1775 Tresaguet introduced in the department of Limoges a system of road building and maintenance which soon became general in France. This system, by making scientific provision for proper drainage, greatly reduced the amount of material required and substituted for the old periodical, haphazard road mending by the inefficient compulsory labor of the "corvée" continuous, systematic maintenance by permanently employed laborers employed by the state or departments and under the supervision of skilled engineers. This system, with but slight modifications is still in force. The state department of roads and bridges (*Corps des Ponts et Chaussées*) which has full control of all state highways is and has been for nearly a century and a half the chief controlling force in all road matters in France.

In England, until near the close of the 13th century, the duty of maintaining the King's Highway devolved entirely on the Lord of the Manor. From 1285 until 1555, however, we find a gradually increasing trend toward placing this burden on the parish. In 1555 the duty of road maintenance was by statute definitely placed on the parish and for the next 300 years Parliament was often obliged to devise new ways and means to enforce this obligation.

As travel and trade increased, the demand for improved roads became more and more insistent, and finally the argument that, "Every person ought to contribute to the roads in proportion to the use he makes or the benefit he derives from them," found favor with Parliament and the toll-road era began. The toll-road or turnpike consisted of a grant or franchise by Parliament to a company to improve and maintain a certain length of road and establish toll gates and collect certain fixed tolls for each passage over the road. These charters were usually granted by Parliament for a term of 21 to 31 years, and, during the early period of toll-road existence, were usually renewed without question. The first turnpike act by Parliament was passed in 1663 and during the later part of the 18th century the toll roads multiplied very rapidly. Not less than 1,100 such trusts or companies, involving about 20,000 miles, existed in 1838 when the railroad began to make itself felt in diverting the large coaching traffic. The toll road, however, never became popular with the public. The inherent fault was the impossibility of fixing a rate of toll which would be accepted as fair by all. Many of the turnpike trusts, also, proved financially unprofitable, due largely to the high cost of collecting the tolls. In 1878 England provided that no further charters should be granted and that as the existing charters expired the toll roads should be taken over by

ROADS AND HIGHWAYS

2 The Axenstrasse, Switzerland

the highway districts or counties. However, the last turnpike in England and Wales, the Anglesey portion of the Shrewsbury and Holyhead road, did not go out of existence until 1 Nov. 1895.

In 1835 quite comprehensive legislation was enacted, relieving the parish of some of the burden of road maintenance by entirely abolishing statute labor and providing a money rate in its place. In 1878 a general act provided for taking over the turnpikes as their charters expired and in connection with the Act of 1888 provided for the care of these roads by the county and of all others by the district.

The greatest benefits to the turnpike roads, as well as to all the roads in general, however, came, not through acts of Parliament, but from the work of two individuals, Thomas Telford (1757-1834) and John Loudon MacAdam (1756-1836). Their work consisted mainly in devising more scientific methods of construction and maintenance. From 1800 to 1830, the methods advocated by these men, especially those of MacAdam, were largely adopted, not only in Great Britain but also in many parts of continental Europe and America. The types of construction developed by these engineers are still known throughout all English-speaking countries as macadam and telford.

In 1909 a further step in centralizing the road work of England was taken by Parliament in the establishment of a road board and providing national aid to the various county councils on roads carrying extraordinary traffic. In 1914 plans had been practically completed for further classification of the roads and for direct national aid and control on the more important roads of the kingdom. The war, however, caused all these plans to be postponed.

The early settlers of the United States brought with them the institutions of the mother country. The history of the development of road building in the United States, therefore, bears a marked resemblance to that of England, especially in the movement from extreme localization toward centralized control. Thus, the first road legislation in the United States, adopted by the House of Burgesses in Virginia in 1632, provided for the most extreme local control in the construction and maintenance of the public roads. Moreover, in much of the road legislation passed by the several colonies provisions for means and methods of local self-control form a striking feature.

Near the close of the 18th century the toll-road movement, then at its height in England, made its appearance in the United States. Charters were first granted to toll-road companies in Virginia in 1772, and what is said to have been the first toll road in the United States was established in this State between Alexandria and Sniggin's Gap in 1785. The Philadelphia-Lancaster turnpike which was begun in 1792 was the first toll road in the United States surfaced with broken stone.

The growth of the toll-road movement in the United States was at first extremely rapid and large amounts were invested. Almost invariably, however, the rate of tolls levied soon became a fertile source of complaint and dissatisfaction to the users of the road. In many cases the undertakings also proved unprofitable to the investors. Some States, especially Kentucky and Virginia, assisted in the construction

of toll roads, either by direct appropriations or indirectly through the purchase of stock in the companies. In general, however, direct State participation in toll-road construction proved both unprofitable and unpopular and was consequently discontinued.

In 1806 the ever-growing demand for better means of communication with the West found expression in the adoption of an act by Congress providing for the construction of a National Road from the head waters of the Potomac to the Ohio River, which should be free from tolls. This act was later extended so as to provide for the construction of this road to the Mississippi River at Saint Louis. Actual progress, however, was slow. The first section from Cumberland, Md., to Wheeling, W. Va., was not completed and opened for traffic until August 1818. Gradually the construction was extended across Ohio and practically completed to Indianapolis. By this time, however, the rapid and successful development of railroad transportation had impressed Congress with the belief that the railroads were certain to supersede the wagon roads for all but the most extremely local traffic. Consequently, appropriations for the construction of the National Road became less and less and finally ceased in 1848 after the expenditure of nearly \$7,000,000 of Federal funds. The road was only partially completed west of Indianapolis, and even the grading ceased entirely at a point near Vandalia, Ill.

With the coming of the railroads Federal as well as direct State participation in road construction or improvement ceased for nearly half a century. The appearance of the bicycle, however, in the latter part of the 19th century brought the need of better roads sharply to the public attention. A movement for more centralized direction found immediate favor as it was clearly impossible to secure any extensive, co-ordinated improvements so long as the various local bodies had unlimited control. The first definite result was the adoption of State aid in road improvement by New Jersey in 1891, which was followed by Massachusetts in 1892. Then came the motor vehicle with the attendant and ever-growing demand for better roads. The force of this demand can be readily understood from the fact that on 1 Jan. 1919, there were 6,147,000 automobiles and motor trucks in use in the United States.

The movement for better roads, however, has steadily followed along the line of State aid and more centralized control in the management of the public roads. A still wider recognition of this movement was secured in 1916 with the passage of the Federal Aid Road Act, approved 11 July. This act authorizes the Secretary of Agriculture to co-operate with the States, through their respective State highway departments, in the construction of rural post roads. The particular roads to be improved are selected by the State highway department of each State and approved by the Secretary of Agriculture. For carrying out the provisions of this act, Congress appropriated \$75,000,000, of which \$5,000,000 was made available for the fiscal year 1917, and a sum increasing annually by \$5,000,000 for each of the following years until 1921, when \$25,000,000 will be available. An amendment to this act on 28 Feb. 1919

and trails in or partly within the national forests, in co-operation with the State, territory or county, upon a basis equitable to both parties. This Federal participation already has resulted in a marked activity on the part of States, until at the present time every State in the Union has succeeded in establishing some form of State highway department and is providing for some form of State aid or assistance to the local communities.

Current Highway Data.—Cash expenditures on the rural roads and bridges in the United States in 1918 amounted to \$286,598,000. To this should be added the value of the statute and convict labor, which cannot be fixed with any great degree of accuracy, but probably amounted to not less than \$14,000,000, thus

making the grand total expenditure for the year \$300,000,000. This total is made up of the actual expenditure for such items as labor, materials, supervision, management and administration directly connected with the construction, improvement and upkeep of our public roads and bridges. During 1917 the grand total expenditure amounted to approximately \$280,000,000.

This, however, does not represent the total outlay by the States and communities because of their rural public roads. At present there are outstanding more than \$400,000,000 of road and bridge bonds and long-term warrants, maturing at the rate of about \$20,000,000 per year and requiring about an equal amount for the payment of interest charges. These outlays are not included in the totals.

From 1904 to 1915, inclusive, the annual increase in the expenditures on rural roads and bridges amounted to approximately 12 per cent over each preceding year. The increase of 1916 over that of 1915, however, was only 2 per cent, and that of 1917 over 1916 about 1 per cent. This was due largely to the scarcity of labor and materials which caused an unusually large amount of road work to be deferred.

The public rural roads of the United States at present have a total length of 2,478,332 miles, of which about 299,000 miles, or 12.0 per cent, are improved with some form of surfacing. The mileage of hard-surfaced roads is increasing at the rate of about 12,000 miles per annum. During 1918 the State highway departments surfaced about 4,000 miles under State supervision and also improved an additional 7,000 miles by grading or otherwise. The several State highway departments also supervised the maintenance of 200,000 miles of main and trunk-line highways.

In regard to our city and village streets no such exact data are available. Their total length is estimated at 250,000 miles and the total annual expenditure for construction, improvement and maintenance at more than \$300,000,000. In general, their control in regard to construction and maintenance is vested entirely in the respective local authorities without any State assistance or supervision.

The expenditures in 1916 by or under the various State highway departments and also the expenditure of State and local funds for the years 1904, 1914, and 1916, as well as the total rural road mileage and that improved, are shown in Table I on preceding page.

Austria-Hungary.—The central government has general supervision of all roads. The state or government roads are constructed and maintained at the expense of the imperial government, while the cost of the lesser roads are borne by the various political subdivisions according to their importance with or without government grants. In 1914 there were in Austria 10,008 miles of state, 2,288 miles provincial, 39,212 district and 22,756 miles of town roads, or a total of 74,265 miles of all classes of roads. In Hungary there were 5,600 miles of state, 17,400 miles of county, 8,100 miles of district and 700 miles of parish roads, or a grand total of 31,800 miles. In Austria the average annual cost of maintaining the

state roads was \$311 per mile and \$282 per mile in Hungary, exclusive of bridges.

Canada.—Canada has no central road organization, but the control of the public roads is vested in the respective provinces through their local subdivisions. However, in line with the road movement in the United States the several provinces have established provisions for more or less provincial aid and control, the form of which is not exactly alike in any two provinces. The total mileage in the Dominion amounts to about 250,000 miles of graded roads. Surfaced roads are confined largely to Ontario, Quebec and British Columbia. The annual road and bridge expenditures amount to about \$22,000,000, or about \$88 per mile. On 4 July 1919 the Federal Parliament passed an act providing for \$20,000,000 in Federal aid to the province during a period of four years. Each province through its highway department is to receive \$80,000 annually plus 40 per cent of the cost of such road work as is approved by the Federal Road Department within the limits of the total allotment to each province.

Great Britain.—The only national highway authority is the road board established in 1910, which has the power to make contributions toward approved schemes of improvement and until 1916 was provided with revenues from the motor vehicle registration fees and the license tax on motor spirits, amounting to about \$8,000,000 annually. Otherwise, the roads and streets of England and Wales are maintained by 1,891 local authorities, those of Scotland by 337 and those of Ireland by about 370 local authorities. England and Wales have a total of 152,085 miles of roads, of which 33,624 miles were in urban areas or practically city streets. The average annual expenditure is about \$52,000,000, or \$730 per mile on the city streets, and \$28,000,000 or \$230 per mile on the rural roads. Of the roads in rural areas, however, 23,833 miles, or 20 per cent, are classed as main roads and require an annual expenditure of about \$600 per mile. Scotland has 24,908 miles of roads of which 2,244 might be classed as streets. The average annual expenditure on the streets amounts to about \$2,500,000, or about \$1,000 per mile, and \$4,000,000, or \$175 per mile, for the rural roads. Ireland has a total of 58,334 miles of road which cost annually about \$5,000,000, or \$86 per mile.

France.—The roads are divided into three general classes—national roads, 23,756 miles, built and maintained entirely by the national government; departmental roads, 8,161 miles, maintained at the expense of the departments and 331,855 miles of vicinal roads, built and maintained by the communes with occasional subsidies by the national government. In addition there are about 155,000 miles of rural lanes of entirely local importance. The national roads as well as most of the departmental roads are under the care of the corps of bridges and roads of the ministry of public works consisting of a complete, non-political organization from the highly trained engineers and administrative officials down to the road men or cantonniers. Each cantonnier has immediate charge of about 2.8 miles of road. The average annual cost of maintaining the national roads is about \$335 per mile, the departmental roads \$190 per mile, and the vicinal roads about \$110 per mile.

¹Statistics relating to continental European countries refer to 1914 or the pre-war period.

Germany.—The construction and maintenance of the public roads is in the hands of the several states without any control from the central authority. Classification and methods of management and control differ among the several states. In general, however, the roads are divided into state or provincial roads, under the control of the state or province, county or district roads under the district, and parish or local roads which are usually a local burden. There are approximately 36,000 miles of improved state roads distributed as follows: Prussia, 20,489 miles; Bavaria, 4,200 miles; Saxony, 2,267 miles; Baden, 1,890 miles; Württemberg, 1,710 miles; and the other small states 444 miles. Of county roads Prussia has 38,400 miles, 14,598 miles of parish roads and 1,100 miles of private roads, all of which are improved with a hard surface. The total annual road expenditure in Prussia is about \$35,000,000, of which the provinces pay 28 per cent, the districts 33 per cent, and the parishes 39 per cent.

Italy.—The roads of Italy aggregate a total of 92,000 miles divided as follows; National, 5,200 miles, built and maintained by the national government at an annual average cost of \$275 per mile; provincial roads, 27,800 miles, built and maintained by the provinces at an average cost of \$185 per mile, and 59,200 miles of local roads provided for by the communes.

Norway.—The roads of Norway have a total length of 17,550 miles, of which 6,570 are main roads for the construction of which the national government has contributed from two-thirds to three-fourths of the cost. The cost of maintenance is almost entirely a local burden, though under the supervision of a national director of roads.

Russia.—There are about 12,000 miles of post roads in Russia either under the control of the ministry of ways and communication or the department of war. The average annual maintenance cost of these roads is about \$200 per mile. The cost of other roads is borne by the local communities.

Spain.—There are about 34,000 miles divided into state and provincial roads. The state roads are constructed and maintained by the general government through the department of public works at an annual average cost of about \$240 per mile.

Sweden.—There are 36,000 miles of road in Sweden made up of 12,000 miles of main and 24,000 miles of district roads. On the main roads which are under the supervision of the royal board of road building and waterworks the government pays two-thirds of the cost of construction and 15 per cent of the maintenance. The total annual expenditure is about \$70 per mile for all classes.

Switzerland.—Switzerland has no central road authority. The roads are left to the cantons and their municipalities, though the federal government grants aid to certain more important roads, which have a total length of about 350 miles. The cantonal roads have a length of 875 miles and local roads 6,250 miles.

ANDREW P. ANDERSON,

Highway Engineer, Office of Public Roads and Rural Engineering, United States Department of Agriculture.

ROAN ANTELOPE, a large and handsome South African antelope (*Hippotragus equinus*), related to the exterminated blaubok and the beautiful sable antelope, which is of a reddish hue, with strong black and white markings on the face. It is becoming very rare.

ROANNE, rô-ân, France, town in the department of the Loire and an important railway junction, 59 miles by rail northwest of Lyons. Extensive engineering workshops are located here, besides iron and copper foundries, many dye-works, pottery and tile works. Pop. about 36,000.

ROANOKE, Va., city in Roanoke County, on the Roanoke River and on the Norfolk and Western Railroad, 53 miles west of Lynchburg. Roanoke was formerly a leading tobacco market, but in later years has become the centre of a large section rich in iron mining and farming interests. Roanoke has extensive iron manufacturing interests, rolling mills, tobacco factories, bottling works, box factories, locomotive and car shops, canning factories, wheel and spoke factories, machine shops, saw mills, planing mills, wooden-ware factories, knitting and silk works, iron furnaces, bridge works, foundries, rolling mill, cotton mill, carriage and wagon factories and many smaller industries. The Virginia College for young ladies and the National Business College for both sexes are located here, and the famous Hollins Institute for young ladies is located within seven miles of Roanoke. There is also a very fine high school, and grammar and other schools, courthouse, city-hall, Academy of Music, and numerous fine business blocks. The city is governed by a mayor and city council elected by the people. There is an excellent paid fire department and electric street railways and electric lights. The city has an improved sewer system and two waterworks plants. There are several national and State banks, excellent hotels, daily and weekly newspapers and monthly periodicals. Roanoke, prior to 1880 known as Big Lick, was incorporated in 1884, and has grown steadily in population, wealth and solid industry. Its present population is about 42,000.

ROANOKE, a river in Virginia and North Carolina, formed by the confluence of the Dan and Staunton rivers at Clarksville, Va. It flows south and southeast for nearly 300 miles, entering the Atlantic Ocean through Albemarle Sound. It is a tidal stream fully 80 miles from its mouth and is navigable to its source. The Dan and Staunton are navigable for small vessels for some distance from the Roanoke. At Halifax, N. C., there are rapids and falls which furnish considerable water power. A canal has been built around this obstruction to navigation.

ROANOKE COLLEGE, located at Salem, Va. It was established in 1853 under the auspices of the Evangelical Lutheran Church, and is governed by a self-perpetuating board of trustees. It offers a classical course, leading to the degree of A.B., and a business course, and has also a preparatory department. It is coeducational, but few women have enrolled. The college possesses a numismatic collection of considerable value, a library with about 25,000 volumes, and grounds and buildings valued at over \$144,000. The endowment funds

amount to over \$215,000 and the annual income to about \$32,000. The annual enrolment of students is over 200; the faculty numbers 19.

ROANOKE COLONY, The, in American colonial history the name applied to a famous land grant of the Crown. In 1584 Sir Walter Raleigh, having obtained a large grant of land from Queen Elizabeth, sent out 9 April, seven vessels and 108 settlers under the command of Sir Richard Grenville. After skirting the West Indies and Hispaniola, they landed at Roanoke, in North Carolina, 20 June. Ralph Lane was left in charge of the settlement and Grenville returned to England. During the following winter Lane made numerous exploring expeditions and suffered greatly from Indian attacks. In the spring he received some aid in men and supplies from Sir Francis Drake, but finally the settlers persuaded Drake to take them home. Soon after Grenville arrived with new settlers. These had been destroyed by the Indians when, in 1587, a new colony of Raleigh's, under White, came out. White himself returned to England. When he came back (1590) he found the colony vanished. It seems to have been destroyed by the savages, though there is a theory that descendants of the colonists are still to be found among North Carolina half-breeds.

ROANOKE ISLAND, Battle of. After the capture by Union troops of fort Hatteras and Clark, at Hatteras Inlet (q.v.), 29 Aug. 1861, the Confederates began to erect works on Roanoke Island, to command the narrow channel connecting Albemarle and Pamlico sounds, considered as the key to one-third of North Carolina, the possession of which by the Union forces would enable them to reach the railroad connecting Richmond with New Orleans. The Union authorities decided to seize the position, and 7 Jan. 1862 General Burnside, who had a division of 12,000 men, was ordered to seize and hold Roanoke Island, capture Newbern and Fort Macon, open the harbor of Beaufort and, if practicable, to advance from Newbern and seize the railroad to Goldsboro. On 7 January vessels carrying the troops set sail from Annapolis, and by night of the 10th more than 80 vessels of all kinds had rendezvoused at Fort Monroe, 20 being war vessels, carrying over 60 guns, under command of Flag-Officer L. M. Goldsborough. The fleet was divided into two columns under commanders S. F. Hazard and S. C. Rowan. The expedition sailed from Fort Monroe on the night of the 11th, and after many mishaps, in which some vessels were lost, by 4 February had passed into Pamlico Sound, and orders were given for the advance on Roanoke Island. On the morning of the 5th the start was made, with 65 vessels in all, naval vessels and transports. On the 7th the armed vessels engaged the Confederate batteries on the west side of Roanoke Island, and also small gunboats, which were soon driven off. The forts were silenced and on the morning of the 8th, Burnside had over 8,000 troops and a battery ashore at Ashby's Harbor. Confronted by Confederate works, manned by nearly 6,000 men, he had formed his division into three brigades, commanded by Gens. J. G. Foster, Jesse L. Reno, and John G. Parke. The advance was ordered early in the morning, Foster leading, in the centre, Parke on the right and Reno on the left. While Foster

pressed the front and engaged with his artillery, Reno marching at times waist-deep in the mud of the swamps, gained the right of the Confederate position, Parke in the same manner gaining the left, and, after a more than three hours' fight, a simultaneous charge was made and the entire position carried. This cleared the road. Burnside marched to the head of the island, where the forts on the shore and their entire garrisons were captured. The Union loss was 37 killed 214 wounded and 13 missing. The Confederate loss was 23 killed, 58 wounded, 62 missing and about 2,650 captured, including 159 officers. The Confederate gunboats went up Albemarle Sound to Elizabeth City, pursued next morning by Commander Rowan, with 14 vessels. Rowan promptly attacked, and after a short but severe engagement, Lynch, the Confederate commander, ordered the abandonment of his boats, ran them aground and set them on fire. Rowan had two killed and six wounded. Having gained entire possession of Roanoke Island and the control of the inland waters of North Carolina, Burnside's next step was the capture of Newbern (q.v.). Consult 'Official Records,' Vol. IX; the Century Company's 'Battles and Leaders of the Civil War,' Vol. I. See NEWBERN, OPERATIONS AT, IN THE CIVIL WAR.

E. A. CARMAN.

ROARING, a disease of horses whereby the air-passages are partially obstructed, giving rise, when the horse is briskly exercised, to a peculiar noise in breathing. The disease is due to inflammation of the larynx or of the windpipe, with wasting or paralysis of some of the laryngeal muscles, whereby the glottis becomes contracted. The fluid discharged from the affected parts, changing into a tough, viscid substance, adheres to the larynx and upper part of the windpipe and further obstructs them. But the specific causes of roaring are various. It sometimes follows strangles. Carriage-horses are more subject to it than saddle-horses, because of the injury done to the larynx by tight reining. There are also various kinds of roaring, distinguished by the sounds, as whistling, wheezing, high-blowing and piping. The disorder does not appear to be amenable to treatment, though in early stages, as when it proceeds from catarrh or influenza, it may be relieved by blisters or setons. The disease renders a horse unsound, as it unfits him for the ordinary strain of work.

ROARING BUCKIE, common Scottish name for the red whelk (*Chrysodomus anti-quus*) so-called because of the sound heard when held to the ear and believed by the uninformed to be the murmur of the sea from which the shell came.

ROARING FORTIES, a sailor's term for a region of the great Southern Ocean lying south of lat. 40° to 45° S., where strong and often stormy west-northwest winds prevail. Owing to these winds the outward voyage to Australia by sailing vessels is made via the Cape of Good Hope and the homeward voyage via Cape Horn. The same name is sometimes given by analogy to a belt of the North Atlantic about 40° to 50° N.

ROASTING. See COOKERY.

ROB ROY, a romance of the Scottish border, written by Sir Walter Scott and published anonymously in 1818, takes its name from the famous Highland brigand, Rob Roy MacGregor Campbell, who is at the time of the story engaged in the Jacobite plots which led to the uprising of 1715. The narrative is put into the mouth of Francis Osbaldison, son of a London merchant. Exiled to the home of his uncle, near the border, he falls in love with the highly unconventional Diana Vernon and incurs the hostility of Rashleigh Osbaldison, a dark villain, who is at first an adherent of and later a traitor to the Jacobite cause. In endeavoring to recover certain papers stolen by Rashleigh, the loss of which will ruin the house of Osbaldison, Francis makes an expedition to the Highlands and witnesses the exciting conflict between Rob Roy's outlaws and the forces which the government has sent to capture him. He is befriended by the brigand, and after the suppression of the revolt succeeds in winning the hand of Diana. The story is chiefly valuable for its account of the turbulent life of the clansmen and particularly for the memorable picture of the romantic and high-spirited Rob Roy, a sort of Robin Hood of the Highlands. Of almost equal interest is the realistic sketch of the fox-hunting and besotted inhabitants of Osbaldison Hall. Aside from these elements the novel is a typical romance of mystery and adventure, superior only by virtue of the skill and relish with which Scott handles his materials to the 18th century romantic fiction with which it is allied.

For bibliography, consult IVANHOE.

JAMES H. HANFORD.

ROBBER COUNCIL. See EUTYCHES.

ROBBER-FLY, bee-killer, many species of mostly large, slender and long-bodied (sometimes stout) strong and active flies of the family *Asilidae*, which prey upon many kinds of insects, by darting upon them in mid air and stabbing them with their dagger-like beaks. These instruments are armed at the tip with bristles which prevent the victim from escaping until his death is accomplished. Some species might easily pierce a man's skin, but do not do so unless in self-defense, nor attack cattle. They are dreaded by bee-keepers, however, as they destroy bees and where numerous may seriously interfere with honey gathering or even prevent swarming. Hence a common name is "bee-killer." Some of them resemble wasps, to which their evil deeds are often attributed. They lay their eggs in earth-mold or rotten wood, and the larvæ live in the ground where they prey upon insects and their eggs. Some, however, are supposed to feed upon grass roots. Over 3,000 species are known, of which about 400 are American.

ROBBER, PALM or **COCOANUT CRAB**, a large and powerful land-crab (*Birgus latro*) of the East Indies, related to the hermit-crabs, which lives in a hole in the earth under trees, lining its burrow with the fibrous cocoanut husks, has an almost lung-like modification of the gill-cavity for breathing air directly, yet visits the sea annually in droves to spawn. It goes abroad only at night and feeds on cocoanuts, though it does not climb for them, and is itself eaten in Amboyna and elsewhere. Darwin has graphically described how it tears

the husk from the cocoanuts and hammers on the round depressions at one end until entrance is effected. Consult Forbes, 'A Naturalist's Wanderings' (1885).

ROBBERY, is the wrongful taking, without a claim of right, of a thing of value from one's person against his will, or by force, or through placing him in fear. In the United States the offense is regulated by the statutes of the various jurisdictions, in some of which the degree of guilt depends on the nature of the act. Actual force need not be employed to induce fear, and fear may extend to a threatened destruction of one's property or injury to reputation. The law does not hold that the property must be in the actual physical possession of one, or in contact with his person, but merely that it must be in his presence, or in his immediate control; the property need not belong to the person from whom it is taken. Two or more persons may be equally liable for robbery if participating in any of the acts by which it is carried out. Punishment for robbery is fixed by statute.

ROBBIA, rōb'bē-ā, Luca della, Italian sculptor: b. Florence, 1400; d. 1482. In the Early Renaissance he appeared as the foremost artist of all his contemporaries, and created a new school of sculpture by his marble friezes for the organ-loft of the Duomo at Florence. These are still to be seen in the Bargello Palace of the same city. The work was completed in 1445 and represents in 10 panels, angels and boys singing and playing on various instruments, to the rhythmic movement of the dance. For refined and chastened fancy, skilful grouping and animated expression this masterpiece showed a vast advance on the hieratic sculptures of mediævalism. The enthusiasm with which it was greeted was redoubled, when in conjunction with Michelozzo and Maso di Bartolommeo, he executed the bronze doors for the Old Sacristy of the Duomo (1446-64). His name is, however, especially associated with works in clay reduced to pottery in the kiln, and colored and glazed like faience. This faience sculpture was unknown before his time and in it he improved the common process of glazing by a new method all his own. Numberless were the reliefs, medallions, tympanum groups, altars and other decorations which he and his pupils produced in this style. He began by plain white reliefs on a flat blue ground; the flawless beauty of his profiles in many sculptures of this kind have been the inspiration of succeeding artists. But he gradually enriched the coloring by the addition of other tints, some critics think, with a loss to classic purity and simplicity; yet the harmonious composition of his designs, the charm of expression which appears in everything he did, added to the boldness with which he ventured into a new field of plastic art have won for him a sort of unique glory among the artists of the Renaissance. His works and those of his pupils are met with in every part of Tuscany, and some examples may also be seen in the museums of Europe. Among his most eminent pupils were his nephew, Andrea della Robbia (1437-1528); and the sons of this latter, Giovanni (1469-1529) and Girolamo (1488-1566). Consult Barbet de Jouy, 'Les Della Robbia' (1855); Cavalucci et Mohnier, 'Les Della Robbia' (1884); Leander Scott, 'Luca Della Robbia' (1883).

ROBBIN, rōb'īn, Albert Farthing, English writer: b. Launceston, Cornwall, 1 Aug. 1856. He entered journalism in 1871 and has long been London correspondent of the *Birmingham Post*. In addition to several comedies and other dramas he has published 'Practical Politics or the Liberalism of To-day' (1888); 'The Early Public Life of William Ewart Gladstone' (1894), etc.

ROBBINS, rōb'īnz, Wilford Lash, American Protestant Episcopal clergyman: b. Boston, Mass., 7 Aug. 1859. He was graduated from Amherst in 1881, studied at Cambridge Theological Seminary, was ordained deacon in 1884 and held his first charge at Lexington, Mass., in 1885-87, where he was advanced to the priesthood in the following year. He was appointed dean of the Cathedral of All Saints at Albany 1887-1903 and in the year last named became dean of the General Theological Seminary, in which relation he remained until 1916. He has published 'An Essay Toward Faith' (1900); 'A Christian's Apologetic' (1902), etc.

ROBERT I, king of Scotland. See *BRUCE, ROBERT* (3).

ROBERT II, king of Scotland, son of Walter III, steward of Scotland, and Marjory, daughter of Robert Bruce; b. Scotland, 2 March 1316; d. Dundonald Castle, Ayrshire, 13 May 1390. He was recognized as heir to the Scottish throne by Parliament in 1318, but superseded by a son afterward born to King Robert, who succeeded him in 1329 under the title of David II. In 1333, Robert, then steward of Scotland, was a leader at Halidon Hill and in 1334 was appointed joint regent with Moray. In 1338-41 he was sole regent and after the battle of Neville's Cross in 1346, where King David was taken prisoner, was again made regent. After the death of David in 1371 Robert was declared king and was crowned shortly afterward, the first of the Stuart dynasty. He ratified a treaty with France in the first year of his reign, and continued a nominal truce with England until the succession of the English king, Richard II, with whom he waged two wars. In the latter of these Richard II and the Duke of Lancaster made successful forays into Scotland. In 1388 these were avenged by an invasion of England by two armies and the famous battle of Otterburn (Chevy Chase) was then fought. The long-continued border wars and the disorders caused by the turbulent barons caused the king, whose increasing age disinclined him to the arduous duties of reigning, to entrust the management of the kingdom to his second son, the Duke of Albany, in 1389, and he then retired from public life.

ROBERT III, king of Scotland, eldest son of Robert II; b. Scotland, about 1340; d. Rothesay, Bute, 4 April 1406. He was originally known as John Stuart, Earl of Carrick, but assumed the name of Robert on his coronation in 1390. He possessed little strength of mind and incapacitated for military service by his lameness, delegated, therefore, the guidance of military affairs to his brother, the Duke of Albany. The friends of the king's eldest son, the Duke of Rothesay, forced the abdication of Albany in 1398 and war was renewed with England. Scotland was invaded for the last time by an English king in 1400, and in 1402 the Scottish troops met with disastrous defeat at

Homildon Hill. Albany then regained the regency, imprisoned Rothesay at Falkland Castle, where he starved him to death, and caused Robert III, in his terror of him, to send his second son James to France for safety. James was captured and imprisoned by the English and his father on learning of the event went into melancholy and died soon after. Scott's 'Fair Maid of Perth' is based upon various incidents related above.

ROBERT, Christopher Rhinelander, American philanthropist: b. Brookhaven, N. Y., 23 March 1802; d. Paris, France, 28 Oct. 1878. He was a merchant's clerk in New York for five years before engaging in business for himself at New Orleans; and in 1830 he returned to New York, became head of the firm Robert and Williams and also president of a large coal and iron company. He amassed a fortune and in 1862 retired from business. He was a generous benefactor of Hamilton College and of the Auburn Theological Seminary, but was chiefly interested in the American College at Constantinople, which was later named Robert College in his honor. His gifts to it during his lifetime and by bequest totalled \$461,000.

ROBERT, Henry Martyn, American military engineer and parliamentarian: b. Robertville, S. C., 2 May 1837. He was graduated from West Point in 1857, was assistant professor of natural philosophy, and later of military engineering there in 1857-58 and served on frontier duty 1858-61. He was on duty as an engineer officer through the Civil War, was promoted captain in 1863, and major in 1867, and served as professor of practical military engineering at West Point in 1865-67. In 1867-90 and 1891-95 he was on duty in connection with river and harbor improvements, light-houses and fortifications. In 1890-91 he was engineer commissioner of the District of Columbia. He was made president of the board of engineers for fortifications and of the New York and Philadelphia Harbor Line Boards, and division engineer of the southwestern division including river and harbor improvements from Pittsburgh to Galveston. He was promoted brigadier-general chief of engineers in 1901, and was retired shortly after. Since his retirement he has acted as president of the board which designed the Galveston seawall and grade raising, and was consulting engineer to design the causeway-bridge connecting Galveston Island with the mainland. In 1911 he planned the improvement of the port of Frontera, Tabasco, Mexico. He is the author of 'Rules of Order' (1876), and 'Rules of Order Revised' (1915); 'Index to Report of Chief of Engineers of the United States Army on River and Harbor Improvements from 1866 to 1887' (Vol. I, 1881; Vol. II, 1889).

ROBERT, Louis Leopold, French painter: b. Les Eplatures, near Chaux-de-Fonds, Switzerland; d. Venice, 20 March 1835. His teachers were the copperplate engraver Girardet in Paris, and the painter David. In 1818 he visited Rome and the study of life among the common people there furnished material for some of his smaller genre pictures. He was especially happy in his representation of robber life in Italy, and his 'Sleeping Brigand' in the National Gallery at Berlin is much admired. But it was at Naples that he found material for his first mas-

terpiece 'The Improvisator' (1823). This was succeeded by 'The Return from the Festival of the Madonna' (1827), now in the Louvre; 'The Arrival of the Reapers in the Pontine Marshes' (1830) in the Louvre; of which latter a replica with variations is in the Berlin National Gallery. In 1832 he visited Venice and completed 'The Departure of the Fishermen of the Adriatic.' An unrequited attachment for the Princess Charlotte Bonaparte preyed upon his mind and he committed suicide in Venice. In his pictures the life of the Italian common people is delicately idealized, and among his contemporaries his works were greeted as they appeared with the greatest enthusiasm.

ROBERT, Duke of Normandy, surnamed **THE DEVIL**; d. Nicea, Asia Minor, 22 July 1035. He was the younger son of Duke Richard II and ascended the throne in 1028 in succession to his brother, Richard III, whom he was said to have poisoned. The earlier years of his reign were passed in the subjugation of his vassals. Then he interfered in various princely quarrels, restoring Baldwin IV of Flanders to his estates, and aiding Henry I of France against the plots of the latter's mother. In 1034 he undertook an expedition against England, in support of his nephews, whom Canute had excluded from the succession, but his fleet was wrecked off Jersey, and the attempt failed. He now set out on a pilgrimage to Jerusalem; and while returning died suddenly in Nicea, poisoned, perhaps, by his servants. His heroic deeds and penance have given rise to numerous stories. 'La Vie du terrible Robert le Diable, lequel fut après l'homme de Dieu' appeared in 1496, and was much imitated. On it was based the grand opera 'Robert le Diable,' text by Scribe and Delavigne, music by Meyerbeer. William the Conqueror was his son. Consult Tardel, 'Die Sage von Richard dem Teufel' (1900).

ROBERT, Duke of Normandy, eldest son of William the Conqueror; b. about 1054; d. Cardiff, Wales, 10 Feb. 1134. In 1087 he succeeded his father as Duke of Normandy, but not as king of England, and he made no serious effort to take the throne from his younger brother, William II, although he received offers of assistance in the project. His rule in Normandy proved irresolute, he lost the county of Maine, and was continually engaged in quarrels with his brothers. In 1096, however, Robert and William II reached an understanding, and Robert, pledging his duchy to William for five years in order to raise 10,000 marks, set out on the first crusade. He greatly distinguished himself during the operations leading to the capture of Jerusalem and is said to have refused to become king of the new Latin Kingdom. He returned to Normandy in 1100, to find William II dead and his younger brother, Henry, on the throne. He journeyed to England in 1101 to claim the succession but was persuaded to withdraw. In 1106, however, Henry invaded Normandy, took Robert prisoner at the battle of Tinchebrai, 28 Sept. 1106, and kept him in prison the remaining 28 years of his life. While deprived of his liberty and detained successively in the Tower of London, and the castles of Devizes and Cardiff, Robert is said to have been otherwise well-treated. Consult Freeman, E. A., 'History of the Norman Conquest' (1870-76); and 'The Reign of Rufus' (1882).

ROBERT OF BRUNNE. See **BRUNNE**, **ROBERT OF**.

ROBERT COLLEGE, Constantinople, Turkey, so called after Christopher R. Robert of New York, its chief benefactor, was organized by James H. and William B. Dwight, sons of the Rev. Harrison G. O. Dwight, an American missionary to Turkey. It was opened in 1863, its financial support being guaranteed by the philanthropy of Mr. Robert who died in 1878, and whose total contributions to the institution amounted to \$450,000. In 1864 the college was affiliated with the University of New York. Its first president was the Rev. Cyrus Hamlin, D.D., who at his resignation in 1877 was succeeded by the Rev. George Washburn, D.D. The curriculum is similar to that of the average American college; while English is the principal language in use, instruction is also given in 13 other languages. The first home of the college was in a private house; the two college buildings built in 1871 and 1891 respectively occupy a fine site on the Bosphorus.

ROBERT ELSMERE, a novel by Mrs. Humphry Ward, published in 1885. It is a brilliant example of the embodiment in a work of fiction of intellectual problems of contemporary interest and recounts the struggles of an Anglican clergyman who cannot accept all the miracles and dogmas of Christianity, while in deep sympathy with its spirit. The work had a phenomenal success, partly owing to the nature of its subject, and partly to its genuine literary merit. Aside from its intrinsic value, the sensation it produced entitles it to rank as one of the most remarkable books of its generation.

ROBERT-FLEURY, rô-bâr, flê-rî, **Joseph Nicolas**, French painter; b. Cologne, 8 Aug. 1797; d. Paris, 5 May 1890. In early life he studied under Gros at Paris, and after visiting the galleries and studios of Italy finally settled in the French capital. His works are distinguished for impressive characterization and profound sentiment; and among them may be mentioned 'Night of Saint Bartholomew's' (1833); 'Religious Conference at Poissy in 1561' (1840); 'Jane Shore after her Condemnation Insulted by the People' (1850); 'Sack of a Jew's House at Venice in the Middle Ages' (1855); the last three are in the Luxembourg Museum. He also decorated with paintings the hall of the Chamber of Commerce at Paris.

ROBERT-FLEURY, Tony, French painter; b. Paris, 1 Sept. 1837. He was a pupil of Delaroche and Cogniet and is known for his historical and genre pictures, as well as for portraits. Among his best works are 'Warsaw on 6 April 1861'; 'Scene During the Polish Insurrection'; 'The Old Women of the Piazzo Ravona, Rome' (1867, in the Luxembourg); 'The Daughters of Danaus' (1873); 'Charlotte Corday at Caen in 1793' (1874); 'The Sack of Corinth' (1870, in the Luxembourg); and a ceiling picture in the Luxembourg 'The Apotheosis of French Sculpture.'

ROBERT OF GLOUCESTER, English historian. He was a monk in the abbey of Gloucester in the latter half of the 13th century, but of his life there is nothing known. His history of England extends from the fabulous Brutus to about 1300 A.D. The work is written

in Anglo-Saxon, showing the transition stage of the language previous to Chaucer, and its chief value is linguistic. It is in verse, and contains upward of 10,000 lines and is filled with the most absurd fables. Numerous manuscripts prove its popularity. These are found in the Bodleian, Cottonian, Herald's College, and other libraries. Thomas Hearne printed it at Oxford in 1724, but the best edition is that of Aldis Wright in the Rolls series (two vols. 1887). It is partly based on earlier works, is wholly destitute of originality and some have thought it a translation from the French.

ROBERT GUISCARD, gēs'kār, THE RESOURCEFUL, Norman-Italian soldier and noble, b. near Contances, Normandy, c. 1015; d. Cephalonia, Greece, 15 July 1085. His father was Tancred of Hauteville. His brothers William of the Iron Arm, Dgo and Hemphrey having gained distinction in Italy, Robert who had developed into a strikingly handsome man, tall and blonde, with a dominating voice, as described by Anna Comnena, in 1046, in his 30th year followed them, but was not warmly welcomed. He, however, soon became a leader of men during the tumultuous period of reconstruction then being attempted in Italy. In 1057 he succeeded his brother Humphrey as Count of Apulia, and while their brother Richard conquered Capua, Robert with his youngest brother Roger completed the conquest of Apulia and Calabria. Previously looked on with disfavor by the papal authorities, in 1059 Pope Nicholas II concluded a treaty with Robert creating him Duke of Apulia and Calabria and Lord of Sicily provisionally, on the conquest of the island. This, however, was not accomplished until 1090, five years after the death of Robert. He incurred excommunication in 1074 for attacking Benevento, a papal possession, but in 1080 was reconciled to Pope Gregory VII, who needed his assistance against Henry IV. Having become master of southern territorial Italy, in 1081 he embarked on a victorious campaign in the Balkan Peninsula against the Greek Byzantine Empire, championing the cause of Michael VII, who had been deposed by Alexius Comnenus, and whose son was his prospective son-in-law. In 1083 he was recalled to the aid of Pope Gregory VII, besieged by Henry IV in the castle of Sant' Angelo, Rome. He raised the siege, quelled a revolt of the citizens by a three days' sack of the city in May 1084, and re-established the Papacy. Returning to the Greek campaign he died of fever in the following year at Cephalonia and was buried at Venosa. Consult *Amatus*, 'Ystoire de li Normani' (ed. by Delarc, Rouen 1892); Chalandon, F., 'Histoire de la domination normande en Italie et en Sicile' (Paris 1907); Comnena, A., 'Corpus scriptores historice Byzant' (Bonn 1839); Heinneman, L. v., 'Geschichte der Normannen in Unteritalien und Sizilien' (Leipzig 1894).

ROBERT OF MOLESME, mō-lām, Saint, founder of the Cistercians: b. Champagne, 1018; d. Molesme, 1110. At 15 he became a Benedictine monk in the abbey of Montier-la-Celle, where on account of his high and religious character he was elected prior while still the youngest member of the community. He was afterward appointed abbot of Saint Michael de Tonnerre. He was induced to leave this

abbey through the recalcitrancy of the monks. In Colan, however, a desert place near the abbey, there lived certain anchorites, and at their request he became their superior; they thence removed to the forest of Molesme, where they built themselves cells and an oratory dedicated to the Holy Trinity (1075). Here the community became relaxed in discipline through the bounteous contributions proved by the bishop of Troyes and others. Robert, therefore, left them and eventually settled with some devout members of the abandoned community at a place called Cistercium, or Citeaux, five leagues from Dijon in the diocese of Chalons. They chose a spot in the uninhabited forest with the consent of Walter, bishop of Chalons, and Renand, viscount of Beaune, lords of the territory. The day of their establishment was Saint Bennet's Day, 21 March 1098, from which must be dated the foundation of the Cistercian Order. The rule established by Saint Robert allotted four hours for sleep, four for singing the offices, four for manual labor and four for study. Thus was the great, practical and highly useful Cistercian Order founded; and it was presided over by Abbot Robert until his death.

ROBERTS, Benjamin Stone, American soldier: b. Manchester, Vt., 1811; d. Washington, D. C., 29 Jan. 1875. He was graduated from West Point in 1835, and in 1839 became chief engineer in the construction of the Champlain and Ogdensburg Railroad. He was assistant geologist of New York State in 1841, and in 1843 was admitted to the bar and engaged in law practice. At the outbreak of the Mexican War he re-entered the army with rank as lieutenant. He served at Vera Cruz, Cerro Gordo, Contreras, Churubusco, Matamoros and the Galajara pass, was promoted captain, received brevet rank of lieutenant-colonel, and at the close of the war was voted a sword of honor by the Iowa legislature. In 1861 he was commissioned brigadier-general of volunteers and served under General Pope as chief of cavalry in the Army of Virginia. He was present at Cedar Mountain and the second battle of Bull Run and at the close of the war was brevetted brigadier-general in the regular army. In 1866 he became lieutenant-colonel of cavalry and in 1868 accepted the chair of military science at Yale which he occupied until his retirement in 1870. He was the inventor of the Roberts breech-loading rifle.

ROBERTS, Benjamin Titus, American Methodist clergyman: b. Leon, Cattaraugus County, N. Y., 1823; d. Chili, N. Y., 27 Feb. 1893. He was graduated at Wesleyan University in 1848, joined the Genesee Conference of the Methodist Episcopal Church, but in 1860 was one of the seceders from that body who founded the Free Methodist sect, of which he became the first general superintendent. In the same year he began a monthly magazine called *The Earnest Christian*, and in 1865 founded the Cheeseborough Academy at North Chili, N. Y., serving as its president from 1869 until his death. He wrote 'Fishers of Men'; 'Why Another Sect'; 'First Lesson in Money'; 'Ordaining Women.'

ROBERTS, Brigham Henry, American journalist and politician: b. Warrington, Lancashire, England, 13 March 1857. In the summer of 1866 he emigrated with his parents to

Davis County, Utah. In 1878 he was graduated from the University of Utah, and soon afterward was called by the Mormon Church to its missionary service. After laboring for some years as a missionary he was elected to a high office in the church. He also engaged in journalism and was editor-in-chief of the *Salt Lake Herald*. In 1895 he was a member of the State constitutional convention. At the first State election he was the Democratic nominee for Representative to Congress, but was defeated. In 1898, however, he was elected by a large majority. His election created widespread agitation throughout the country, and on 25 Jan. 1900 the House of Representatives by an overwhelming majority voted to exclude him as constitutionally ineligible, as a polygamist, to a seat in that body. He is the author of 'The Gospel' (1888); 'Life of John Taylor' (1892); 'Outlines of Ecclesiastical History' (1893); 'Succession in the Presidency of the Church' (1893); 'A New Witness for God' (1895); 'Missouri Persecutions' (1900); 'The Rise and Fall of Nauvoo' (1900); 'Mormon Doctrine of Deity' (1903); 'Defense of the Faith and the Saints' (2 vols. 1905). He also edited numerous volumes of Mormon Church history.

ROBERTS, Charles George Douglas, Canadian author: b. Douglas, near Fredericton, New Brunswick, 10 Jan. 1860. He was educated at the University of New Brunswick, in 1883-84 was editor of the *Toronto Week*; in 1885-87 was professor of English and French literature in King's College (Windsor, N. S.); and was professor of economics and international law from 1887 until his resignation in 1895, since when he has lived in New York. His reputation was first made as a poet with a gift of melody, a clear and grave manner, and a particular felicity, noticeable in the Canadian school, in pictures of nature. Later, he became equally known for his prose work in 'The Heart of the Ancient Wood' (1900), and 'The Kindred of the Wild' (1902), the latter one of the most successful of imaginative treatments of wilderness life. The collection of short stories, 'Earth's Enigmas' (1896), also is marked by an interesting individual quality. Among Roberts' other volumes are 'In Divers Tones' (1887); 'Ave: An Ode for the Shelley Centenary' (1892); 'Songs of the Common Day' (1893); 'The Raid from Beausejour' (1894); 'A History of Canada' (1897); 'The Book of the Native' (1897); 'The Forge in the Forest' (1897); 'By the Marshes of Minas' (1900); 'The Book of the Rose' (1903).

ROBERTS, David, English painter: b. Edinburgh, 24 Oct. 1796; d. London, 25 Nov. 1864. In 1818 from being a house painter he advanced to the profession of scene painter, and in 1821 painted scenery for the stage of Drury Lane, London. All this while he was studying drawing and oil painting, and in 1826 and 1827 he attracted attention by his pictures of Rouen and Amiens cathedrals. Later on he traveled in Spain, Morocco, Egypt, Palestine, Italy, Belgium, making drawings of great buildings and landscapes with picturesque edifices, and working them up into pictures. Among his works the following are the most noteworthy: the drawings from Spain for the 'Landscape Annual' (1835-38), and illustrations for the volume entitled 'The Holy Land, Syria, Idumea,

Arabia, Egypt, and Nubia' (1842). His other pictures represent numerous interiors of churches; as Saint Miguel at Xeres, Holy Nativity at Bethlehem, Saint Jean at Caen, Saint Paul at Antwerp, Saint Peter's at Rome, the cathedrals of Milan and Seville. Among his religious historic pictures are 'Departure of the Israelites from Egypt' (1829); 'Ruins of the Great Temple at Karnac' (1845); 'Destruction of Jerusalem' (1849), which were followed by 'Rome' (1855), and 'Grand Canal at Venice' (1856). Roberts' style was essentially spectacular; he produced grand, broad effects, with magnificent architectural arrangements, to which the details are of course generally sacrificed.

ROBERTS, Edmund Quincy, American diplomat: b. Portsmouth, N. H., 29 June 1784; d. Macao, China, 12 June 1836. He engaged in a mercantile career at 13, lived in Buenos Aires and afterward in London and had gained considerable shipping interests when he returned to the United States at the age of 24. He arranged preliminary negotiations with the sultan of Zanzibar in 1827, resulting in friendly relations and a satisfactory treaty with the United States, and in 1832 was sent to Muscat, Siam and Cochin-China as a special diplomatic agent to secure commercial treaties. He returned in 1834 and in 1835 was sent on a similar mission to Japan, but died en route. Author of 'Embassy to the Eastern Courts' (1837). Consult Ruschenberger, W. S. W., 'A Voyage Around the World, Including an Embassy to Muscat and Siam' (1838).

ROBERTS, Edwin Ewing, American politician: b. Pleasant Grove, Cal., 12 Dec. 1870. In 1890 he was graduated at the California School of Elocution and Oratory, San José, and in 1891 at the State Normal School of San José. In 1891-99 he taught school, was admitted to the bar in 1899 and has since been practising at Carson City, Nev. He served five terms as district attorney of Ormsby County, Nev., in 1900-08, and in 1911-19 was member of the 62d to the 65th congresses. In 1918 Mr. Roberts was Republican choice for United States Senator from Nevada.

ROBERTS, Ellis Henry, American financier: b. Utica, N. Y., 30 Sept. 1827. He was graduated from Yale in 1850 and in the following year became editor and proprietor of the *Utica Morning Herald*. He sat in the State legislature in 1867, was a member of Congress 1871-75, afterward continuing his editorial work until 1889, when he was appointed assistant treasurer of the United States. In 1893-97 he was president of the Franklin National Bank in New York, and since 1897 has been United States treasurer. He has published 'Government Revenues' (1884); 'The Planting and Growth of the Empire State' (1887).

ROBERTS, George Evan, American authority on finance and director of the United States mint: b. Delaware County, Iowa, 19 Aug. 1857. He was educated in the public schools and in 1878-1909 was proprietor of the *Fort Dodge Messenger*. He was State printer of Iowa in 1882-89, and was director of the United States mint in 1898-1907 and 1910-14. He has since been assistant to the president of the National City Bank of New York. Author

of 'Coin at School in Finance' (1895); 'Iowa and the Silver Question' (1896); 'Money, Wages and Prices' (1897); 'Business After the War' (1916), etc.

ROBERTS, Howard, American sculptor: b. Philadelphia, 1843; d. Paris, 19 April 1900. He studied at the Pennsylvania Academy of Fine Arts and in 1866 went to Paris and studied under Dumont and Gurney at the École des Beaux Arts. In 1875 he established a studio in Philadelphia and at the Centennial Exhibition exhibited a statue, 'La Première Pose,' that created a sensation on account of its superior technical qualities. He received one of the three medals awarded to American sculptors. Other works are 'Eleanor'; 'Hester Prynne'; 'Hypatia'; 'Lot's Wife,' nearly all being at the Pennsylvania Academy.

ROBERTS, Isaac Phillips, American agriculturist and educator: b. Seneca County, N. Y., 24 July 1833. After several years' connection with the agricultural department of the State College of Iowa he became connected with Cornell University. He was professor of agriculture and dean of the faculty of agriculture there in 1873-94; director of the agricultural experiment station in 1888-1903, and professor emeritus and lecturer on agriculture from 1903. He was for many years assistant editor of *The Country Gentleman*; wrote about 1,200 articles for agricultural papers, and was also author of 'The Fertility of Land' (1898); 'The Farmstead' (1900); 'The Farmers' Business Handbook' (1903); 'The Horse' (1905); 'The Autobiography of a Farm Boy' (1916).

ROBERTS, John Bingham, American surgeon and author: b. Philadelphia, Pa., 29 Feb. 1852. He was graduated at the University of Pennsylvania in 1871, received the degree of A.M. in 1874, and that of M.D. at Jefferson Medical College in 1874. He was formerly attending physician and lecturer on clinical medicine at Jefferson Medical College Hospital; was president of the Philadelphia County Medical Society, also of the Medical Society of the State of Pennsylvania, Philadelphia Academy of Surgery, Philadelphia Polyclinic and College for Graduates in Medicine, American Academy of Medicine, and section on anatomy of the first pan-American Medical Congress; and former vice-president of the Pathological Society of Philadelphia and of the American Surgical Association. Dr. Roberts is treasurer of the College of Physicians of Philadelphia; Fellow of the American Association for Advancement of Science, the American Medical Association and membre original de la Société internationale de chirurgie. He was formerly lecturer on anatomy and surgery in the Philadelphia School of Anatomy; lecturer on anatomy, University of Pennsylvania; professor of surgery in the Woman's Medical College of Pennsylvania; Muetter lecturer on pathology of the College of Physicians of Philadelphia, and surgeon to various hospitals in Philadelphia. He is professor of surgery in the Philadelphia Polyclinic and College for Graduates in Medicine. Dr. Roberts has published 'Paracentesis of Pericardium' (1880); 'Compensated Anatomy' (1881); 'Surgical Delusions and Follies' (1884); 'Treatise on Modern Surgery' (1890); 'Modern Medicine and Homoeopathy' (1895); 'Fracture of Radius' (1897);

'Surgery of Human Brain' (1897); 'Notes on Modern Treatment of Fractures' (1898); 'Deformities of Face' (1900); 'The Doctor's Duty to the State' (1908); 'Surgery of the Face' (1912); 'Treatise on Fractures,' with James A. Kelly (1916). He has contributed articles to systems and encyclopædias of medicine and surgery (Bryant, Holmes, Ashhurst, Dennis, Pepper, Keen) and *Transactions of the American Surgical Association* and other periodicals.

ROBERTS, Morley, English novelist and journalist: b. London, 29 Dec. 1857. After study at Owens College, Manchester, he went, in 1874, to Australia, and there worked on railways in Victoria and as a sheep and cattle rancher in the New South Wales bush. Then he was before the mast in merchant ships, and after some experience in the quartermaster-general's department of the British war office and in the India office, set out again traveling, visiting in 1884-86 many of the western United States, Canada, British Columbia and Manitoba, and later the South Seas. His hardships and adventures have lent a certain element of vigor to his stories, which are better known in England than in the United States and include 'King Billy of Ballarat' (1891); 'The Reputation of George Saxon' (1892); 'Red Earth' (1894); 'The Degradation of Geoffrey Alwith' (1895); 'The Great Jester' (1896); 'The Circassian' (1896; with Max Monteleone), an interesting book of Eastern life; 'The Keeper of the Waters' (1898); 'The Colossus' (1899), which, as giving a portrait of Cecil Rhodes (q.v.), was perhaps most talked of among Roberts' works; 'Immortal Youth' (1902); 'The Way of a Man' (1902); 'The Promotion of the Admiral' (1903); 'Bianca's Caprice' (1904); 'Lady Penelope' (1905); 'Captain Baalaam' (1905); 'The Idlers' (1905); 'The Prey of the Strongest' (1906); 'The Blue Peter' (1907); 'The Flying Cloud' (1907); 'Lady Anne' (1907); 'Captain Spink' (1908); 'David Bran' (1908); 'Midsummer Madness' (1909); 'Sea Dogs' (1910); 'The Wonderful Bishop' (1910); 'Thorpe's Way'; 'Four Plays' (1911); 'The Man who Stroked Cats'; 'The Private Life of Henry Maitland' (1912); 'Gloomy Fanny' (1913); 'Time and Thomas Waring'; 'Sweet Herbs and Bitter' (1914).

ROBERTS, Oran Milo, American jurist and governor of Texas: b. Laurens District, S. C., 9 July 1815; d. Austin, Tex., 19 May 1898. He was graduated at the University of Alabama in 1836, was admitted to the bar in 1837 and engaged in practice. He served in the State legislature in 1839-40, and in 1841 removed to Texas. He became district attorney in 1844, and after Texas' admission to the United States was district judge in 1846-51. He was associate justice of the Supreme Court of Texas in 1857-61. He served in the Confederate army in 1862-64, and was then appointed chief justice of the Supreme Court of Texas. He was elected to the United States Senate in 1866, but was not permitted to take his seat. He was again chief justice of the Texas Supreme Court in 1874-79; was governor of Texas in 1879-83, and was subsequently professor of law at the University of Texas. Author of 'Governor Roberts' Texas' (1881).

ROBERTS, Robert Richford, American Methodist bishop: b. Frederick County, Md., 2 Aug. 1778; d. Lawrence County, Ind., 26 March 1843. He removed with his family in 1785 to Ligonier Valley, western Pennsylvania, and was brought up on the frontier. He obtained Methodist books, studied for the ministry, in 1802 was licensed to preach, served as an itinerant preacher for several years, and later was in charge of important pastorates in Baltimore and other cities. In 1816 he was elected bishop and soon after removed to Indiana. He did much for Indian missions, and among the Indians he was known as "the grandfather of all the missionaries." Consult Charles Eliot, 'Life of Bishop Roberts' (1853).

ROBERTS, William Henry, American Presbyterian clergyman: b. Holyhead, Wales, 31 Jan. 1844. He was graduated at the College of the City of New York in 1863; at Princeton Theological Seminary in 1873; and was ordained in 1873. He was statistician of the Treasury Department at Washington, D. C., in 1863-65, and assistant librarian of Congress in 1866-71. He was pastor at Cranford, N. J., in 1873-77; librarian at the Princeton Theological Seminary in 1878-86; and professor of practical theology at Lane Theological Seminary, Cincinnati, Ohio, in 1886-93. In 1895-1900 he was acting pastor at Fourth Church, Trenton, N. J. He occupied many important church organization offices, was moderator of the general assembly in 1907, and as its secretary edited its minutes in 1884-1914. Author of 'History of the Presbyterian Church' (1888); 'Laws Relating to Religious Corporations' (1896); 'Manual for Ruling Elders' (1897), etc.

ROBERTS, William Milnor, American civil engineer: b. Philadelphia, 12 Feb. 1810; d. Brazil, South America, 14 July 1881. As early as 1831 he was senior principal assistant engineer on the Allegheny Portage Railroad, and in 1835 he planned and built across the Susquehanna River at Harrisburg the first combined railroad and highway bridge in the United States. During the next 20 years he was engineer or contractor on many American railroads and canals. In 1857 he went to Brazil and undertook the construction of the Dom Pedro II Railroad. During 1866-68 he was United States civil engineer in charge of improvements of the Ohio River; from 1868-70 associate contractor with James B. Eads in building the bridge across the Missouri at Saint Louis. In 1870 he became chief engineer of the Northern Pacific Railroad, and in 1874 visited Europe on an observation tour of jetties as member of the commission of civil and military engineers to report on plans for the improvement of the mouth of the Mississippi River. In 1879 the emperor of Brazil appointed him on a commission of hydraulic engineers to report on harbors and rivers of Brazil, and in prosecution of these labors he died of a fever. He was president of the American Society of Civil Engineers in 1879.

ROBERTS OF KANDAHAR, PRETORIA AND WATERFORD, Frederick Sleigh, 1st EARL, British soldier: b. Cawnpore, India, 30 Sept. 1832; d. Saint Omer, France, 14 Nov. 1914. Son of General Sir Abraham Roberts; he was educated at Eton, Sandhurst and Addiscombe; and was commissioned second lieutenant, Bengal artillery in 1851. At

the outbreak of the Indian mutiny he was deputy assistant quartermaster-general, and fought at the siege and capture of Delhi and at the second relief of Lucknow. He won the Victoria Cross at the action of Kali Nadi by recovering, single-handed, a standard with which some sepoy were making off. In 1863 he was employed in the Umbeyla campaign, and four years later accompanied the Bengal brigade to Abyssinia under Gen. Donald Stewart. For his services he was made brevet lieutenant-colonel, and in 1871 became a C.B., after serving with the Lushai expeditionary force. When in 1878 the war with Afghanistan broke out, he was placed in command of the Kurram field force. At the close of the first phase of the war Roberts was awarded the thanks of both houses of Parliament and made a K.C.B. Then came the Kabul massacre. The Indian government was unprepared; the force under Roberts was the only one in a position to strike for Kabul. He successfully fought his way through and spent several months of continual fighting around Sherpur. Eventually matters quieted down and the war was considered over when in July 1880 Ayub Khan defeated General Burrows' brigade at Maiwand and besieged General Primrose in Kandahar. Helplessness seized the British government, but Roberts saved the situation. He set out with fewer than 10,000 men on the 313 miles' journey from Kabul to Kandahar. It was a daring and highly risky undertaking to lead such a small force through a wild and hostile country without a base of operations or communications of any kind, and toward a point presumably already in the hands of the enemy. For four weeks the world heard nothing of Roberts and his column. They reached Kandahar, raised the siege and completely defeated Ayub Khan with a loss of 2,000 men, whilst the British losses amounted to only 248 killed and wounded. Again he received the thanks of Parliament and was created a baronet. His next post was that of commander-in-chief in Madras. The Majuba Hill disaster occurred 27 Feb. 1881 and Britain once more turned to General Roberts to retrieve its fortunes. He was sent to South Africa, but only remained there 24 hours, peace having been concluded in the meantime. In 1885 he was appointed commander-in-chief in India, and shortly after took charge of the final operations in the Burma War. The next seven years, though years of peace, brought no rest to the strenuous soldier. He built fortifications, strengthened and safeguarded the frontiers, prepared defense schemes, established regimental institutes, introduced skilled nursing in the military hospitals, improved the shooting of British as well as native troops, and devised many other benefits which have permanently written his name over the Indian Empire. In 1893 he completed 41 years' service in India. After a spell of rest Lord Roberts took command of the forces in Ireland, and it seemed that his fighting days were over. Perhaps he himself wished it, for 44 years of toil and hardship under foreign skies had left their mark upon him. He had behind him a career and a reputation that the most ambitious might envy, but fate demanded that his life's work should be crowned by yet another effort — perhaps his greatest. To the old soldier it was a crown

more of sorrow than glory. His only son fell fighting at Colenso, 16 days after winning the Victoria Cross. In his 68th year Lord Roberts responded once more to his country's call; the eyes of the British Empire turned instinctively to the one man who, in their estimation, was the man to redeem the melancholy blunders and disasters of the South African War. Nor were their hopes disappointed. He returned to England in 1900, after the capture of Pretoria and Bloemfontein, leaving Lord Kitchener to continue and wind up the guerrilla fighting. Roberts was then appointed commander-in-chief of the British army, made an Earl and a K.G., and was formally thanked for his services by King Edward VII. Parliament also voted him a grant of \$500,000. He served in his new command until its abolition in 1904, when he retired. The last 10 years of his life were devoted to exhorting his countrymen to place their great heritage in such a condition of strength and preparedness that they might be able to regard the unknown future with that confidence born of timely sacrifice and prudent foresight. He was fully aware of Germany's designs and preparations for a war of world domination, but to a large extent his voice fell on deaf ears. In November 1914 he died while on a visit to the British line, resisting the German invasion of France. He was given a public funeral in Saint Paul's Cathedral. The earldom descended, by special remainder, to his daughters and their issue. Lord Roberts published 'The Rise of Wellington' (1895); 'Forty-one Years in India' (1897; new ed., 1915). Consult Cobban, J. M., 'The Life and Deeds of Earl Roberts' (4 vols., London 1901); Forrest, Sir George, 'The Life of Lord Roberts' (New York 1914); Menpes, M., 'Lord Roberts' (New York 1915); Vickers, Roy, 'Lord Roberts: The Story of His Life' (London 1914).

ROBERTSON, Archibald Thomas, American Baptist theologian: b. near Chatham, Va., 6 Nov. 1863. He was educated at the Southern Baptist Theological Seminary; became associated with its teaching staff in 1888, and since 1895 has been professor of theological interpretation there. Author of 'Syllabus of New Testament Syntax' (1900); 'Short Grammar of the New Testament' (1908); 'The Glory of the Ministry' (1911); 'Practical and Social Aspects of Christianity' (1915); 'Studies in the New Testament' (1915).

ROBERTSON, Frederick William, English clergyman: b. London, 3 Feb. 1816; d. Brighton, 15 Aug. 1853. He was ordained in 1840, and was graduated from Brasenose College, Oxford, in 1841; in that year he was made curate of Christ Church, Cheltenham; and from 1847 until his death was pastor of Trinity Chapel, Brighton. His eloquence was remarkable, and soon extended his renown far beyond local limits. He was an eclectic in theology, and declared for no party in a time when the clergy were generally partisans. His frequent dissent from various positions of the schools of thought brought upon him numerous attacks, whose importance he was wont to overestimate. His views were colored by study of the Germans, and developed considerably during the progress of his ministry. His mind was positive, original and without fear; and his constant labor greatly affected his health. He was deeply interested

in the workmen's institute, which he founded at Brighton, and whose work he made very effective. His 'Sermons' (1855-90), though derived from inadequate shorthand notes or from recollections prepared by himself, have been very widely read. His other important work has been collected in his 'Literary Remains.' Consult the 'Life and Letters' by S. A. Brooke (1865).

ROBERTSON, James, English royal governor of New York: b. Pifeshire, Scotland, about 1720; d. London, England, 4 March 1788. He entered the army and after various services sailed for America in 1756, was appointed major-general of the royal troops raised in America and barrack-master at New York. He commanded a brigade at the battle of Long Island in 1776 and after André's capture made an earnest effort to secure his release. In 1779 he was appointed royal governor of New York, and in 1782 received rank as lieutenant-general. He returned to England in the following year. His reputation was that of an avaricious and supercilious officer and in his position as governor he was charged with arbitrary measures.

ROBERTSON, James, American pioneer: b. Brunswick County, Va., 28 June 1742; d. Chickasaw region, Tenn., 1 Sept. 1814. In 1769 he accompanied Daniel Boone (q.v.) on the latter's third exploration, and stopping at Watsuga (now Elizabethton, Tenn.), planted corn. In 1770 he returned thither with a band of North Carolinian settlers. The settlement soon numbered some 200. Both North Carolina and Virginia asserted jurisdiction over it, but neither colony offered protection; and it was left an independent outpost of civilization. With John Sevier, Robertson became the head of the communities which gathered about the Holston and Watsuga. In 1777 he was commissioned agent of North Carolina among the Cherokees, and during his residence of more than a year thwarted the British agent and kept at peace the great body of Cherokees and Creeks. With a party of settlers he set out in 1779 for the French Lick of the Cumberland, and on 25 December made the beginnings of a town on the site of Nashville, then 15 days' journey from the westernmost white confines. A fort built, a military organization was made, with Robertson as colonel. Troubles increased. Provisions were low, and the Indians hostile. He detached the Chickasaws and Choctaws from their English alliance and concluded a treaty with the Cherokees. He also defended the settlement against the Creeks, who were abetted by the Spanish authorities of Louisiana; and refused to organize a separate state in alliance with Spain. In 1790 Robertson was commissioned United States brigadier-general, and latterly he was government Indian agent. He was well fitted for his frontier career, and especially successful in his dealings with the savages. His favorite saying, "Man proposes, but God disposes," he always insisted was somewhere in the Book of Job. Consult the 'Life' by Putnam (1859); Gilmore, 'The Rear Guard of the Revolution' (1886), and *Harper's Magazine*, February 1888, pp. 420-426.

ROBERTSON, James, Canadian Presbyterian clergyman: b. Dull, Scotland, 24 April 1839; d. Toronto, Canada, 4 Jan. 1902. He removed to Canada with his family in 1855, and

was educated at the University of Toronto, the Princeton Theological Seminary and the Union Theological Seminary, New York. He was pastor at Norwich, Windham and East Oxford, Ontario, in 1869-74, and of Knox Church, Winnipeg, in 1874-81; and was lecturer at Manitoba College, Winnipeg, from 1877. In 1881 he was appointed superintendent of Presbyterian missions for Manitoba and the North West Territory, and achieved a high reputation as an organizer of ability and courage in dealing with the problems of his missions in the wilderness. He was the "sky pilot" of Ralph Connor's (q.v.) tales. He was moderator of the general assembly in 1895.

ROBERTSON, James Burton, English historian: b. London, 15 Nov. 1800; d. Dublin, 14 Feb. 1877. He was educated at the Roman Catholic College of Saint Edmund, near Ware, and was called to the bar in 1825. Later he studied literature, philosophy and dogmatic theology in France. His first important publication was a translation of Frederick Schlegel's 'Philosophy of History' (1835). He lived in Germany in 1851-54, and here produced a translation of Möhler's 'Symbolism or Exposition of Doctrinal Differences Between Catholics and Protestants' (1843), a work which made a deep impression on the Tractarians. In 1855 J. H. Newman, then rector of the Catholic University at Dublin, called him to the chair of geography and modern history and later the department of English literature was assigned him. His original works comprise lectures 'On Subjects of Ancient and Modern History' (1859); 'On Subjects of Modern History and Biography' (1864); on the 'Writings of Chateaubriand, and on the Illuminati, Jacobins and Socialists'; 'On the Life, Writings and Times of Edmund Burke' (1869), together with poetry and translations.

ROBERTSON, James Craigie, Scottish clergyman: b. Aberdeen, Scotland, 1813; d. Canterbury, England, 9 July 1882. He was graduated from Cambridge in 1834, and took orders in the Anglican Church in 1836. He was made canon of Canterbury in 1859, and from 1867-74 was professor of ecclesiastical history at King's College, London. He published 'How Shall We Conform to the Liturgy' (1843); 'Church History' (1852-73); 'Plain Lectures on the Growth of Papal Power' (1876); edited Heylyn's 'History of the Reformation' (1849); 'Materials for the History of Archbishop Thomas Becket' (1875-82), etc.

ROBERTSON, James Wilson, Canadian agriculturist and educator: b. Dunlop, Ayrshire, Scotland, 2 Nov. 1857. He removed with his parents to Canada in 1875, was engaged in farming and cheese manufacture, and was professor of agriculture at the Ontario Agricultural College in 1886-90. He was appointed as the first dairy commissioner for the Dominion in 1890, and was the first commissioner of agriculture and dairying in 1895-1904. He was principal of the Macdonald College at Saint Anne de Bellevue, Quebec, in 1905-09; and from 1910 was chairman of the Royal Commission on Industrial Training and Technical Education, and of the committee on lands of the Canadian commission of conservation. Author of 'Conservation of Life in Rural Districts' (1911).

ROBERTSON, John Mackinnon, British author, lecturer and legislator: b. Brodick, Isle of Arran, 14 Nov. 1856. He received an elementary education at Stirling, Scotland, but left school at the age of 13 years. In 1878 he joined the staff of The Edinburgh *Evening News*, as a leader writer, went to London in 1884 to join the staff of Bradlaugh's *National Reformer*, and was the editor of that publication from the time of Mr. Bradlaugh's death in 1891 until it went out of existence in 1893. Mr. Robertson then started *The Free Review* and was editor of that periodical until 1895. In that year he was the Independent Radical candidate for Parliament for Northampton, but was not elected. He made a lecturing tour in the United States during 1897-98, and in June 1900 he went to South Africa to investigate the condition of affairs in Cape Colony and Natal. His letters from South Africa to *The Morning Leader*, signed "Scrutator," attracted a great deal of attention at the time. He has been member of Parliament for the Tyneside Division of Northumberland since 1906, and was named a Privy Councillor in 1915. He was Parliamentary Secretary to the Board of Trade from 1911 to 1915. He has written a number of books and essays on religious and literary subjects, among which are 'The Dynamics of Religion'; 'Modern Humanists'; 'Buckle and His Critics'; 'History of Free Thought'; 'Christianity and Mythology'; 'Montaigne and Shakespeare'; 'The Baconian Heresy' and 'The Eight Hours Question.'

ROBERTSON, John Ross, Canadian journalist: b. Toronto, 28 Dec. 1844. He was educated at Upper Canada College, where in 1859 he founded the *Upper Canada College Times*. He afterward engaged in journalism, published 'Robertson's Railway Guide,' the first of its kind issued in Canada, and in 1864 he became city editor of the *Toronto Globe*. He founded the *Evening Telegraph* in 1866 and made it a leading Conservative organ. In 1872-75 he was London agent of the *Toronto Daily Globe*, then returned to Canada, and was managing editor of the *Nation*. He founded the *Toronto Daily Telegram* in 1876, acting as its editor and publisher as well as owner, and made it one of the leading Canadian publications of its type. He was one of the founders of the Lakeside Home for Little Children in 1883, as well as the Hospital for Sick Children. He was elected to the Canadian Parliament in 1896. Author of 'History of Craft and Capitalist Masonry in Canada' (1888); 'History of Cryptic, Templar and A. and A. S. Rite Masonry in Canada' (1888); 'Robertson's Landmarks of Toronto' (5 vols., 1905), and editor of 'Diary of Mrs. John Graves Simcoe' (1911).

ROBERTSON, Morgan, sailor, watch-maker, diamond setter, inventor and sea-story writer: b. in Oswego, N. Y., 30 Sept. 1861; d. 4 March 1915. Young Robertson ran away to sea at the age of 16 before he finished his public school education. In 1886 he left the sea and took up the watch-maker's trade. About 1894 he began to write. His best-known books are 'Spun Yarn' (Harper's 1898); 'Where Angels Fear to Tread,' (1899); 'Masters of Men' (1901); 'Shipmates' (1901); 'Down to the Sea' (1905); 'Land Ho' (1905);

'Sinful Peck' (1903). He invented a periscope for submarines, which was the outgrowth of a fiction story. He died suddenly 4 March 1915. A uniform edition of his stories was brought out in 1915.

ROBERTSON, Thomas William, English actor and dramatist: b. Newark-on-Trent, 9 Jan. 1829; d. London, 3 Feb. 1871. He came of a theatrical family and played his first part at the age of four. He had a varied career as actor, newspaper writer, adapter of plays, as well as dramatist, in none being more than successful enough to gain a bare subsistence until he wrote 'David Garrick,' produced by E. A. Sothorn in 1864. This piece has taken a permanent place on the English stage. Following this a play called 'Society' had a long and successful run, making the fortunes of the Prince of Wales Theatre and the author. At the same house were produced his most successful series of plays, including 'Ours,' 'Caste,' 'Play,' 'School,' and 'M. P.' Some of these, especially 'Caste,' his masterpiece, are revived from time to time. His comedy was artificial, with a strong sentimental interest; but he was a good observer of manners and drew his characters from life. He established a distinct school, and has had several followers, though in the best exponents of the later English dramas he has been replaced by writers whose methods are less artificial and hence more logical. His 'Principal Dramatic Works' were published with a memoir by his son in 1889. Consult also Pemberton, 'Life and Writings of T. W. Robertson' (1893); Cook, 'Nights at the Play' (1883); Clement Scott, 'The Drama of Yesterday and To-day' (1899).

ROBERTSON, William, Scottish historian: b. Borthwick, Midlothian, 19 Sept. 1721; d. near Edinburgh, 11 June 1793. After the completion of his course in Edinburgh University, Robertson obtained a license to preach in 1741, and in 1743 was presented to the living of Gladsmuir, in East Lothian. His 'History of Scotland During the Reigns of Queen Mary and King James VI' appeared in 1759, and was received with general applause, though modern research has deprived it of most of its historical value. This work, which reached a 14th edition before the author's death, led to his nomination to the chaplaincy of Stirling Castle in 1759, as one of the king's chaplains in 1761, and as principal of the University of Edinburgh in 1762. The year after he was made historiographer-royal of Scotland, with a salary of £200 per annum. His 'History of the Reign of Charles V' appeared in 1769, and his 'History of America' in 1777. His latest work appeared in 1791, under the title of a 'Historical Disquisition Concerning the Knowledge which the Ancients Had of India, and the Progress of Trade with that Country Prior to the Discovery of the Cape of Good Hope.' Consult 'An Account of the Life and Writings of William Robertson' (1801-02); Gleig, 'Life and Writings of William Robertson' (1812); Graham, 'Scottish Men of Letters in the 18th Century' (1901).

ROBERTSON, William H., American jurist and politician: b. Bedford, N. Y., 10 Oct. 1823; d. Katonah, N. Y., 6 Dec. 1898. He was admitted to the bar in 1847 and engaged in practice in his native town. He served three terms

in the State assembly and eight terms in the State senate between the years 1848-91; and was county judge of Westchester County in 1854-66. He was a member of the 40th Congress, 1867-69. In March, 1881 he was appointed collector of customs for the port of New York by President Garfield, an appointment which met with the determined opposition of Senators Conkling and Platt, of New York, who considered the nomination their political prerogative. The President refused to withdraw the name of Judge Robertson and the two Senators resigned and appealed to the legislature of New York to re-elect them as a rebuke to the President; but the legislature refused to support them and elected other members in their places. The controversy assumed a bitter aspect and resulted in a party split. Robertson's appointment was confirmed by the Senate and he remained in office until the close of President Arthur's term in 1885.

ROBERTSON, Sir William Robert, English general: b. 1860. He began his military career as a lieutenant in the 3d Dragoon Guards in 1888 and served as railway transport officer in the Miranzai and Black mountains expeditions in 1891. He was staff captain and deputy-assistant-quartermaster-general in the Intelligence Branch at Simla (India) 1892-96, and intelligence officer with the Chitral Relief Force in 1895, when he was treacherously attacked and left for dead by his native escort. After serving at the War Office he went to South Africa in 1900 and later became Assistant Director of Military Operations at the War Office until 1907. From 1907 to 1910 he was brigadier-general of the General Staff at Aldershot and commandant of the Staff College 1910-13. At the outbreak of the European War he accompanied the Expeditionary Force as quarter-master-general and was specially commended for his services during the retreat from Mons. In 1916 he became chief of the Imperial General Staff and a member of the Army Council. He resigned from the former in February 1918 and was appointed to the chief command of the forces in Great Britain in June 1918.

ROBERTSON, William Schenck, educator and mission superintendent: b. Huntington, L. I., 11 Jan. 1820; d. 26 June 1881. He was fitted for college at several different academies and graduated from Union College, Schenectady, in 1843. He started to study medicine but, after partially completing his course, decided to devote himself to teaching as a profession. In 1849 he offered himself as a mission teacher to the Presbyterian Board of Foreign Missions and was accepted for service in their work among the Creek, or Muskogee Indians, and was sent out as the principal of Tullahassee Manual Labor Boarding School. The following year (16 April 1850) he married Miss Ann Eliza Worcester, daughter of Rev. Dr. Samuel A. Worcester, superintendent of the Park Hill Mission, in the Cherokee Nation. The work of the Tullahassee Mission was interrupted by the outbreak of the Civil War, in the spring of 1861, Mr. Robertson and his family having to leave the Indian Territory as refugees. During the ensuing five years they were located at Highland, Kan., where he engaged in teaching in a mission school which was operated for the benefit of the children of the

Iowa and Kickapoo Indian tribes. Just before his return to the Indian Territory, in 1866, he was ordained to the ministry of the Presbyterian Church. The Tullahassee Mission was rehabilitated and the work of educating Creek children was resumed, his duties as a teacher occupying his time to such an extent that the work of translating was left to others. He published a paper in the Creek language called *Our Monthly* for some years. In 1876 he was in charge of the Indian educational exhibit at the Centennial Exposition for a time. A man of brilliant attainments, he lived only in his work and the impress of his life and labors remains among the people to whose betterment his self-sacrificing service was given. The property of the Tullahassee Mission was destroyed by fire, 19 Dec. 1880. The work incidental to the plans for rebuilding the mission and the disappointments and discouragements that were encountered are believed to have hastened his death.

ROBERTSON, William Spence, educator and historian: b. Glasgow, Scotland, 7 Oct. 1872. He came to America with his parents in 1878. He graduated B.Litt. in 1899 and M.Litt. in 1900 at the University of Wisconsin. He received his Ph.D. at Yale University in 1903. From 1903-06 he was instructor and from 1906-09 assistant professor of history at the College for Women of the Western Reserve University. In 1907 he was awarded the Herbert Baxter Adams prize in European history by the American Historical Association. After special sessions at Indiana University, from September 1909 he was assistant professor of history in the University of Illinois. Part of the years 1916-17 he spent in travel and study in South America. He is author of magazine articles on the Monroe Doctrine, the diplomatic relations between the United States and Latin America; is a member of learned societies and was decorated with the Order of the Liberator of Venezuela. His published works include 'Francisco de Miranda and the Revolutionizing of Spanish-America' (1909); 'The Rise of the Spanish American Republics, as Told in the Lives of their Liberators' (1918).

ROBESPIERRE, rô-bès-pē-âr or rô'bès-pêr, Maximilien François Marie Isidore, French revolutionist: b. Arras, 6 May 1758; d. Paris, 28 July 1794. He was the son of an avocat and having been left an orphan at 11 was sent by his grandfather to the college of his native town, from which he passed in 1770 to the Collège Louis-le-Grand at Paris on a scholarship given him by the bishop of Artois. After pursuing the study of law with great distinction, he returned, in 1781, to Arras, where he adopted the profession of advocate. Solid, rather than brilliant, he quickly became known as a skilful lawyer and a man of unimpeachable integrity. With growing success he gave much of his time to the dilettante pursuit of literature, wrote essays in competition for prizes offered by the provincial academies and was a prominent member of the Rosati, a society devoted to the cultivation of wit and letters. He was an ardent student of Rousseau and a fanatical believer in the teachings of the Genevan philosopher; indeed Robespierre's unwavering convictions in the possibility of realizing Rousseau's ideal society explains his course

in the days when he stood forth as the greatest figure in France and gives the secret of his temporary success. In the events leading up to the election of the States-General Robespierre appeared prominently as the champion of the liberal views then so widespread among the French bourgeoisie. He was elected fifth deputy to the States-General from Artois and allied himself with the radical faction in that body. In the constituent assembly he spoke frequently and always in the spirit of that equality which he believed was now at length to be established in France. Of small stature and by no means robust health, weak-voiced and pale-eyed, he did not impress himself on the mass of the assembly, but those who came into personal contact with him were gained over by his tremendous sincerity and Mirabeau said of him: "That young man believes what he says; he will go far." Robespierre's great strength, however, was in the club of the Jacobins, where his polished, classical declamations gained him the ardent support of those members who had been recruited from among the working classes and the small bourgeoisie of Paris. His power in the club became absolute when the more conservative members seceded in 1791, after the more radical faction, under the inspiration of Robespierre, had prepared the petition for the deposition of Louis XVI which led to the massacres in the Champ de Mars in 17 July. His popularity was demonstrated on the day of the dissolution of the National Assembly, 30 Sept. 1791, when Robespierre and Pétion were drawn in triumph through the streets of Paris and crowned as "incorruptible patriots" by the people. In accordance with his own motion, adopted in May 1791, prohibiting members of the constituent assembly from sitting in the succeeding legislature, Robespierre took no direct part in the sessions of that body, but he continued to wield great influence over its deliberations through his power in the Jacobins. In February 1792 he became public prosecutor at Paris, but resigned the office in April on account of the virulent attacks of the Girondists, who regarded him with special hatred because of his opposition to their favorite policy of war against Austria. Robespierre's opposition to the war was based on humanitarian grounds; he was, besides, a man of theories and not of action and this would explain the little share he took in the uprisings of 20 June and 10 August, which, under the guidance of Danton, effected what Robespierre was quite pleased to see consummated, the overthrow of the Bourbon monarchy. Shortly after the storming of the Tuileries, Robespierre became a member of the Paris Commune; his personal popularity lent strength to that body, but his inability to prevent the prison massacres of September showed that his power was by no means absolute in the ranks of the radical party.

In the Convention to which he was elected as the first deputy from Paris, Robespierre became the leader of the Mountain. The Girondists turned the full force of their eloquence against him and accused him of aiming at the dictatorship. In the crisis which attended the trial of Louis XVI, Robespierre for once assumed a firm and definite line of action. He pleaded for the death of the king and by so doing gained over to his side the party of Dan-

ton, Carnot and Bellaud-Varenne, who were disgusted by the temporizing policy of the Girondists at a time when France was in imminent danger of foreign invasion and needed a strong government to make headway against her enemies. The condemnation of Louis XVI was a triumph for Robespierre, who, however, did not cease from his attacks on the Girondists. The struggle became one of life and death. In April, Robespierre denounced them in the body of the Convention and on the fateful days of 31 May and 2 June the destruction of the party was accomplished with the aid of the Parisian mob. See GIRONDISTS.

In July 1793, Robespierre was made a member of the Committee of Public Safety, which for a year was to be the virtual ruler of France. To curb dissension at home, so as to present a united front to the foreign foes of the country, the committee organized the Terror with which the name of Robespierre has become, through legend, synonymous. To the world at large Robespierre appeared as the master of the committee and the ruler of France. As a matter of fact, his power was in no way absolute. Of the 12 members of the committee, the majority were quite opposed to his Rousseauian ideals and only two of the 12, Couthon and Saint Just, were professed followers of Robespierre. The rest of the committee were practical men of affairs, like Carnot, Bellaud-Varenne, or Collet d'Herbois, upon whose shoulders fell the real task of government. Robespierre's services to the committee were such as his immense popularity and spotless reputation could render it. He was the apologist for the committee in the Convention and before the people, but he differed from his associates entirely so far as the motives of his action are concerned. While the Terror to them was but a thorough, though possibly radical, means for establishing peace within the country, Robespierre saw in the Terror an effective instrument for bringing about the erection of Rousseau's ideal state, by wiping out all opposed to his favorite theories. He first turned against Hébert (q.v.) and his followers in the Paris Commune, who had aroused his enmity by their uncompromising democracy, in their display of which they were guilty of the most ridiculous excesses and their professed atheism, which attained its climax in the establishment of the worship of Reason by Chaumette. The Hébertists were brought to the scaffold on 24 March 1794, and they were followed by Danton, Camille Desmoulins and their followers on 5 April. On 13 April came the turn of Chaumette. Danton fell because he had begun to advocate a moderation of the Terror and thereby had incurred the enmity both of the men of action on the Committee of Safety and of Robespierre, to whom alike the continuance of the Terror seemed essential. To hasten the work Robespierre caused the infamous law of the 22 Prairial (10 June) to be proposed by Couthon, whereby the revolutionary tribunal was freed from all restrictions of legal procedure and thus improved sent nearly 1,300 persons to the scaffold between 12 June and 28 July.

On 8 June Robespierre attained the zenith of his career, when, as president of the Convention, he celebrated with great pomp the Feast of the Supreme Being, whose existence

had been formally admitted by the Convention in the preceding month. His fall followed speedily. The men on the Committee of Safety who had suffered his official leadership as long as he was content to remain largely a figure-head, turned upon him when he began seriously to assert mastery over the committee. Besides, it became apparent that the excesses of the Terror could not go on and that reparation would be demanded and Robespierre was chosen as the scapegoat of the committee. The attack on Robespierre began 17 June, when Vadier, a member of the committee of general security, satirized him before the Convention. Instead of joining battle, as he was urged to do, Robespierre went into retirement for more than a month to prepare his defense. On 26 July he appeared in the Convention and declared that the Terror should cease and that the committees of public safety and general security should be reorganized. Ominous threats appeared in his oration, which for a time held the Convention terror-stricken and caused it to vote his proposition. Quickly, however, he was assailed by various orators, the Convention reconsidered its action and in the session of the following day, the 27 July, the fateful 9th Thermidor, the secret intrigues of his associates on the committee, the fear of his intended victims and the resentment of the Dantonists, who had not forgotten the death of their leader, fell upon Robespierre. His arrest was ordered and with him that of Saint Just, Couthon, Lebas and his younger brother, Augustin Robespierre. Rescued by the national guards under Henriot and brought to the Hôtel de Ville, the great Terrorist showed no capacity for action. The Convention placed him outside of the law and despatched a portion of the national guard under Barras against him. In the assault Robespierre was shot in the jaw by a gendarme and taken in a pitiful condition to prison. On the following day he was brought before the revolutionary tribunal and with Couthon and Saint Just and others of his followers was sent to the guillotine. Consult Aulard, A., 'La Société des Jacobins' (1891); Hamel, L. E., 'Vie de Robespierre' (Paris 1865-67), the principal authority; Belloc, Hilaire, 'Robespierre' (1902); Morse-Stephens, 'Principal Speeches of the Orators and Statesmen of the French Revolution' (Oxford 1892); Brunnemann, Karl, 'Maximilien Robespierre' (Leipzig 1885); Carlyle, 'French Revolution'; Morley, John, 'Critical Miscellany' (Vol. I. London 1898); Lescuré, M. de, 'La société française pendant la Terreur' (Paris 1882); Lewes, G. H., 'Life of Maximilian Robespierre, with Extracts from his Unpublished Correspondence' (3d ed., London 1899); Sardou, Victorien, 'La maison de Robespierre: réponse à M. Hamel' (Paris 1895); Strada, José de, 'Robespierre et la révolution de l'humanité' (Paris 1899); Warwick, G. F., 'Robespierre and the French Revolution' (London 1909).

ROBERVAL, rô-bér-vâl, Giles Personne, or Personier, de, French mathematician: b. Roberval, near Beauvais, 8 Aug. 1602; d. Paris, 27 Oct. 1675. His family name was Personne, the name of his birthplace being added to it. He studied at Paris in 1627-31, and was then appointed professor of philosophy at Gervais College. In 1633 he was called to the chair

of mathematics at the Royal College of France, which he occupied until his death. He was the first to discover the method of indivisibles but kept it for his personal use, while Cavalieri published a similar method of his own invention, thus raising a question as to priority of discovery in which much animosity developed. He discovered the famous "Robervallian Lines"; a method of determining tangents somewhat similar to that of Descartes, again raising a question as to priority of discovery, and a method of determining the area of a cycloid. Outside the field of pure mathematics he devoted considerable study to the system of the universe, and he invented the Robervallian balance. He was one of the original members of the French Academy of Science. During his lifetime he published nothing, but his works were published after his death by Abbé Galois in the 'Recueil' of the 'Mémoires de l'Académie des Sciences' (1693).

ROBERVAL, Jean François de la Roque, SIEUR DE, French Canadian colonizer: b. Picardy, France, about 1500; d. probably at sea, 1547. He was an officer in the French army and upon the return of Jacques Cartier from Canada in 1536 he was commissioned by the king to attempt the exploration and colonization of New France in Canada. He sailed in 1542 a year after the departure of Cartier's second expedition, wintered at Stadacona (now Quebec), losing many of his men, and afterward led an unsuccessful expedition into the interior. Hunger and cold and failure of promised supplies seriously depleted the number of his followers, and, while accounts of his exploits are conflicting, Francis I appears to have summoned Roberval home to aid in the war in Picardy instead of sending relief for his expedition. He is stated by some authorities to have been killed in France, while others relate that he perished at sea on a second voyage to Canada.

ROBIDOUX, rô-bé'doo, Joseph Emory, Canadian jurist: b. Saint Philippe-de-Laprairie, Quebec, 18 March 1844. He was graduated at McGill University in 1866, was called to the bar in that year and engaged in practice at Montreal. He was later appointed queen's consul and in 1877 he became professor of civil law at McGill University. He served in the Quebec legislature in 1884-92 and in 1897-1900; was provincial secretary and later attorney-general in the Mercier administration; provincial secretary in the Marchand administration, and since 8 Oct. 1900 has been puisne judge of the Supreme Court of Quebec. He became a member of the French Legion of Honor in 1908.

ROBIN, a name originally applied in England to the red-breast (q.v.), a bird so familiar and so dear to the English heart that loyal colonists in many parts of the world have felt impelled to transfer the name to native species, which often resemble the original in little but the ruddy breast. The American robin is a true thrush (*Merula migratoria*) of the family *Turdia*, and is found in summer throughout North America from Alaska to Virginia. Robins retire from higher latitudes only as their food begins to fail, or when driven south by very heavy snows. During the winter months they are numerous in the Southern States, but

even as far north as Boston robins are sometimes seen assembling round the open springs wherever berries may be found in the depth of winter. In the New England and the Middle States the robin is perhaps the most abundant breeding bird. Their nests of mud and grass are often seen on the horizontal branch of an apple tree, or in a shade tree, especially evergreens. The eggs, about four, are of a pale bluish-green, and without spots. They raise several broods in a season.

Robins feed upon insects, ripe cherries and other small fruit, but are especially fond of earthworms, which they extract from their burrows in the early morning and late afternoon with the greatest skill and industry, and of which they devour vast quantities. In spite of the fact that fruit growers consider them harmful, the cheery whistle and vivacious manners of the robin are rapidly gaining for it a place in popular esteem analogous to its English namesake. Unfortunately there are still parts of the country, and particularly of the South, where a sordid interest leads to the slaughter of great numbers of robins for the pot. In North Carolina they are killed at night in their roosting places. On the Pacific Coast the robin varies to the sub-species *propinqua*, and in lower California a distinct species (*M. confinis*) occurs. *Hesperocichla nevada* is sometimes called the Oregon robin.

ROBIN ADAIR, a-där, or EILEEN AROON, a familiar air, which, with the original words, was written, tradition says, by one Carroll O'Daly, an Irishman, of Elizabeth's time. However that may be, it was first popularized in England in the latter 18th century by Tenducci, an original singer in Dr. Arne's 'Artaxerxes.' Tenducci probably learned it in Ireland; at least it is known that he sang 'Eileen Aroon' with Irish words which had been phonetically arranged for him. The 'Robin Adair' form obtained currency through its rendering by Brahm at his benefit in London in 1811. Brahm's version was introduced by Boildieu into the latter's opera of 'La Dame Blanche.' Beethoven made a trio arrangement of it, with accompaniment by pianoforte, violin and 'cello.

ROBIN GOODFELLOW. See PUCK.

ROBIN HOOD. See HOOD, ROBIN.

ROBIN HOOD BALLADS. The. Ballads and tales of the outlaw have been steady favorites of the people of England. Soon after the Conquest, rebels of high rank, like Hereward and Fulke Fitz-Warine, and many a humbler hero who "concealed his life," were said and sung by the popular muse. Their ballads, however, are lost; and the single outlaw who survives as hero of an actual ballad-cycle, and of an epic made directly from the ballad stuff, is 'Robin Hood.' There is obvious temptation to put Robin into the Fulke Fitz-Warine class, and to regard him as a disguised nobleman like the hero of that charming but sophisticated poem, 'The Nut-Brown Maid.' A passage in 'Piers Plowman' (14th century) which certainly attests Robin's early and wide vogue, where Sloth, the alehouse idler, is said to know "rymes of Robin Hood and Randolf of Chester" better than his prayers, serves as an argument for the rank of the first-named

outlaw. He has been made earl of Huntingdon. Yet another theory of origins interprets 'Hood' as 'Woden' and regards Robin as a divinity in disguise. Neither of these suppositions is probable. It is true that legend often borrows from myth; but the supposed mythical attributes are very far fetched in the outlaw's case, and seem impertinent. 'Robin' is probably the word for 'bandit,' and 'Hood' may mean 'of the wood.'

Professor Child concludes a very careful investigation of all the evidence and all the theories by declaring that Robin Hood is neither a nobleman of record nor yet a god; he is simply the ideal and typical outlaw, and is "absolutely a creation of the ballad muse." Of course, some actual "banished man" who went to the greenwood as a victim and became a victor over the cruel forest-laws, may have been the nucleus of this tradition. But the story is localized in more than one place, and the hero is typical, not historical, in person, habit and surroundings. He has aristocratic traits; the "milk-white side" is no yeoman's, and his lavish but capricious generosity is part of the peasant's notion of a lord. His conventional foes are the sheriff and the monk, objects of popular satire. Like the Klepht, or bandit, hero of modern Greek ballads, Robin is the humble man's friend; he takes from the rich to give to the poor, is pious, handsome, miraculously strong and brave. This is the hero of the best and oldest ballads; like other favorites, Charlemagne, for instance, in early French epic and in stories of the 12th century, 'Robin Hood' has two distinct phases and is at last the victim of his own typical excellence. In the best ballads he fights and kills the doughtiest of foes, like Guy of Gisborne, or else displays prodigious valor against overwhelming odds; but in the inferior verse of broadsides and garlands, Robin fares ill at the hands of wayside bullies,—tinkers, potters, what not,—who are thus glorified by victory over the champion and typical hero. Like these inferior ballads, as significant of a second literary growth, must also be reckoned the Robin Hood plays. They introduce with Maid Marian—however ancient their own proper rites—a sentimental note which is alien to the greenwood tradition. Such subjection to base uses, and such changes of character, were the penalty paid by Robin's venerable and universal fame. Pleasanter proof of this popularity is found in proverbial phrases like "going round Robin Hood's barn" and in the many place-names which he has fathered.

The Robin Hood ballads have a double appeal,—to the student of poetry for their significance, and to the lover of poetry for their worth. Thirty-six ballads are preserved, which deal with individual adventures of the hero; a few of these are trash; some are spirited and readable, though low in the poetic scale; and perhaps half-a-dozen belong with the best narrative verse. With these last must be counted the *Gest* (*gesta*, deeds), a little epic of 458 stanzas, or about 2,000 lines, which was made from ballads of the type of 'Robin Hood and the Monk,' and was printed about 1500, although the date of composition must be put earlier. Comparison of one of the older ballads, like 'Robin Hood's Death,' with the same story in the 'Gest' is very suggestive for the epic problem.

At their best, these ballads are a model of popular chronicle verse. They differ widely from the romantic ballads, lacking for the most part, repetition, refrain, and all choral suggestions. They were sung, or chanted, for the story alone. Nowhere, however, is a story better told than the adventures of the Knight, Robin and the abbey folk in the 'Gest,' and the complication of Robin and Little John and the Sheriff; while the opening stanzas of 'The Monk' are famous for their descriptive beauty. The literature of the subject is given by Child, 'Ballads,' III Introduction to the *Gest*. Some books and articles of later date are noted in the bibliography of the chapter on the Popular Ballad in the second volume of the 'Cambridge History of English Literature.'

FRANCIS B. GUMMERE.

ROBIN SNIPE, the red-breasted sand-piper or knot (*Tringa canutus*) in its summer plumage. This is among the largest of the sand-pipers, and is distinguishable by the long, perfectly straight beak combined with the absence of webbing from between the toes, the middle one of which is much shorter than the tarsus. It is upward of 10 inches long and stoutly built, with rather short stout legs. In breeding plumage the entire under parts are reddish brown, and the autumn young, which are abundant during the gunning season, have the breast and belly whitish tinged with red, and the back very characteristically marked with white and black semi-circles. Such seasonal changes in coloration are unusual among the *Scolopacidae*. The knot is nearly cosmopolitan, breeding in high northern latitudes and wintering in the southern hemisphere. It passes through the United States in April and May, and again more leisurely in August to October, frequenting the seashore in small flocks, and, less commonly, the large rivers and lakes of the interior. Its habits are similar to those of the other sandpipers (q.v.), with which it associates. Because of its large size it is a favorite with gunners, among whom it is known in the autumn plumages as the gray-back.

ROBINS, rōb'inz, Benjamin, English mathematician: b. Bath, 1707; d. Fort Saint David, Coromandel coast, India, 29 July 1751. He early became known as a mathematician of unusual ability, and in 1728 published a confutation of the veteran Johann Bernoulli (q.v.), who had attempted a defense of the Leibnitz theory as to the laws of motion relative to bodies impinging on one another. After some time spent as a private instructor in mathematics and physical science, he turned engineer, and made particular study of fortifications and gunnery. He published in 1742 his 'New Principles of Gunnery,' which he had undertaken by way of furthering his unsuccessful candidacy for the professorship of fortification at Woolwich. It was translated into German and French, and has been regarded as the starting point of the modern scientific study of the matter. Much of it was derived from personal experiment with gunpowder. In 1749 he was made engineer-general to repair the forts of the East India Company. He wrote several political pamphlets, which brought him into some notice. In 1761 'Mathematical Tracts,' containing the 'Principles of Gunnery,' appeared under the editorship of James Wilson.

There were subsequent editions. Consult the memoir by Wilson in this collection.

ROBINS, Edward, American author: b. Pau, France, 2 March 1862. He was educated at a military academy in Philadelphia, and in 1883 engaged in newspaper work. He was on the editorial staff of the *Philadelphia Public Ledger* in 1884-88, 1895-97, and has since devoted himself to authorship and as Secretary of the Corporation of the University of Pennsylvania. He has published, besides several juvenile works, 'Echoes of the Play House' (1895); 'Twelve Great Actors' (1900); 'Romances of Early America' (1902); biographies of Benjamin Franklin and Gen. William T. Sherman, etc. He is one of the Councilors of the Historical Society of Pennsylvania and a Director of the Drama League of Philadelphia.

ROBINS, Elizabeth. See PARKES, ELIZABETH ROBINS.

ROBINS, Margaret Dreier, American social economist: b. Brooklyn, N. Y., 19th century. She was privately educated and was married to Raymond Robins (q.v.) 21 June 1905. She was a founder of the Women's Municipal League, New York; was president of the New York Women's Trade Union League in 1905, of the Chicago Women's Trade Union League in 1907-14, and has been president of the national organization since 1907. She has served on the executive board of the Chicago Federation of Labor since 1908, and in 1915 was appointed to the unemployment commission by the governor of Illinois.

ROBINS, Raymond, American social economist: b. Staten Island, N. Y., 17 Sept. 1873. He was graduated at Columbian (now George Washington) University in 1896, and was engaged in settlement work in Chicago in 1902-05. He was a member of the Chicago board of education in 1906-09, and was social service expert for the Men and Religion Forward Movement in 1911-12, making a world tour in its interests in 1913. He was the Progressive candidate for United States senator from Illinois in 1914, and was leader of the National Christian Social Evangelistic campaign in 1915. He is an eloquent and forcible speaker and an advocate of organized labor and land value taxation.

ROBINS, Thomas, American inventor and manufacturer: b. West Point, N. Y., 1 Sept. 1868. He was educated at Princeton University and in 1892 began a series of inventions which led to the perfection of his "belt conveyor" used for carrying coal, ores and other products. The invention received the grand prize at the Paris Exposition in 1900, and first prizes at the Buffalo and Saint Louis Expositions. He is president of the Robins Conveying Belt Company and of the Robins New Conveyor Company. In 1915 he was appointed to the United States Naval Advisory Board.

ROBINSON, rōb'in-sōn, Agnes Mary Frances. See DARMESTER, AGNES MARY FRANCES ROBINSON.

ROBINSON, Albert Gardner, American newspaper correspondent and author: b. Winchester, Mass., 21 Feb. 1855. He received a public school education at Winchester and was engaged in commercial pursuits from 1871 to 1898. In the latter year he became special war

correspondent for the *New York Evening Post* in Cuba and Porto Rico. He was in the Philippines on a similar errand in 1899-1900 and also in South Africa. From 1903 to 1912 Mr. Robinson was a member of the editorial staff of the *New York Sun*. He has written numerous pamphlets, magazine and newspaper articles. His published works include 'The Porto Rico of To-day' (1899); 'The Philippines: The War and the People' (1901); 'Cuba and the Intervention' (1905); 'Cuba: Old and New' (1915).

ROBINSON, Benjamin Lincoln, American botanist: b. Bloomington, Ill., 8 Nov. 1864. He was graduated at Harvard University in 1887 and took his Ph.D. at Strassburg in 1889. He has been curator at Gray's Herbarium since 1902, and Asa Gray, professor of systematic botany at Harvard since 1899. He has been editor of *Rhodora*, the journal of the New England Botany Club, since 1899, and also has edited 'Synoptical Flora of North America' (1892-97); 'Gray's New Manual of Botany' (7th ed.).

ROBINSON, Beverley, American Loyalist soldier: b. Virginia, 1723; d. Thornbury, England, 1792. He was a major under Wolfe at the taking of Quebec in 1759, and at the commencement of the Revolution was a large landed proprietor on the Hudson. He was opposed to the measures of the British ministry respecting the colonies, and abandoned the use of imported merchandise. Nevertheless, he remained loyal, and reluctantly entered the military service of the Crown. The Loyal American regiment was recruited largely by him, and he was made its colonel. He was connected with the negotiations preliminary to Benedict Arnold's treason; and at the time Arnold was occupying as headquarters Robinson's country-seat. At the conclusion of the war he went to New Brunswick, where his name appears as a member of the first council, though he never took his seat; and thence to England. He lost his property by confiscation, and by way of compensation received £17,000 from the English government. Consult Ryerson, 'The Loyalists of America and Their Times' (1880).

ROBINSON, Charles, first governor of Kansas: b. Hardwick, Mass., 18 July 1818; d. Lawrence, Kan., 17 Aug. 1894. He was educated at Amherst and at the Berkshire Medical School, taking his M.D. in 1843. He was engaged in the practice of medicine at Belcher-town, Springfield and Pittsfield, Mass., until 1849, when he went overland to California. He established the *Settlers' and Miners' Tribune* at Sacramento in 1850, was a supporter of squatter sovereignty, and worked earnestly against the movement to establish slavery in California. He was wounded in the riots of 1850, and was indicted for conspiracy and murder; but upon his election to the legislature the case was dismissed without trial. He returned to Massachusetts in 1852 and for two years edited the *Fitchburg Weekly News*. In 1854 he was appointed agent for the New England Emigrants' Aid Association and was sent to Kansas where he became the leader of the Free State party and chairman of its executive committee as well as commander-in-chief of the Kansas volunteers. He was a member of the Topeka convention which framed and adopted a Free

State constitution in 1855 and was elected governor under it in 1856. Ignoring the bogus pro-slavery legislature, but endeavoring to avoid conflict with the Federal authorities he was, upon attempting to perform his duties as governor, indicted for treason and conspiracy on a charge by the Pro-Slavery party. He was acquitted by the Federal grand jury and served out his term. He was re-elected governor by the Free State party in 1858, and was elected for a third time in 1859 under the Wyandotte constitution, taking office after the admission of Kansas to the Union as a State and serving in 1861-63. He organized most of the Kansas regiments for the Civil War during his term. He later served in both bodies of the State legislature and from 1887 he was superintendent of Haskell Institute at Lawrence. The State University of Kansas was erected on land given by him and it received the greater share of his estate. He was author of 'The Kansas Conflict' (1892). Consult Blackmar, F. W., 'Charles Robinson' (1902; 2d ed., 1907).

ROBINSON, Charles Mulford, American author and city planner; b. Ramapo, N. Y., 30 April 1869. He was graduated from the University of Rochester in 1891, and received from it the honorary degree of master of arts in 1905. He was editor of the *Rochester Post Express* from 1891 to 1902, became an officer or honorary member of many civic societies, local, State, national and foreign, and a contributor to magazines. After 1902 he was retained to make city planning studies in municipalities in all parts of the country. He is the author of 'The Improvement of Towns and Cities' (1901; 12th ed., 1916); 'Modern Civic Art' (4th ed., 1917); 'The Call of the City' (1908); 'The Width and Arrangement of Streets' (1911); 'City Planning' (1916). Since 1913 he has been professor of civic design (the first in the United States), at the University of Illinois. From 1907 to 1912 he was contributing editor to *The Survey*.

ROBINSON, Charles Seymour, American Presbyterian clergyman and hymnologist; b. Bennington, Vt., 31 March 1829; d. New York, 1 Feb. 1899. He was graduated from Williams College in 1849, studied at Union Theological Seminary and at Princeton and was ordained in the ministry in 1855. He held a pastorate in Troy 1855-60, and thereafter was pastor of various churches in New York with the exception of 1868-70, when he had charge of the American Chapel, Paris, France. He published several volumes of sermons and other works, and is widely known as a collector of hymns. His publications include 'Songs of the Church' (1862); 'Church Work' (1873); 'The Pharaohs of the Bondage and the Exodus' (1887); 'New Laudes Domini' (1892); 'Annotations on Popular Hymns' (1893); 'Simon Peter: Later Life and Labors' (1894), etc.

ROBINSON, Christopher, Canadian lawyer; b. Toronto, 21 Jan. 1828; d. 1903. He was a son of Sir John Beverley Robinson (q.v.), and was educated at Upper Canada College, King's College and Trinity University, Toronto. He was called to the bar in 1850 and engaged in practice at Toronto in 1852. He was reporter to the Queen's Bench in 1856-72; became editor of *Law Reports* in 1872, and resigned in 1885 upon becoming a bencher of the

Law Society of Canada. He consistently declined public office, and became the acknowledged leader of the Canadian bar. He served as counsel in numerous important cases, among them being the trial of Louis Riel for high treason in 1885; the libel suit of the queen against Wilkinson; the case for the arbitration of the Manitoba boundaries, and the Bering Sea arbitration with the United States.

ROBINSON, Clifford William, Canadian statesman; b. Moncton, New Brunswick, 1 Sept. 1866. He was educated at the University of Mount Allison College, Sackville, New Brunswick, and became attorney-at-law in 1892, engaging in practice at Moncton. He was elected to the provincial Parliament in 1897, became speaker in 1903, provincial secretary in 1907 and Premier later in that year. In 1908 he became leader of the Liberal opposition. He was a member of the government without portfolio after his return to the New Brunswick Parliament in 1917.

ROBINSON, Sir Clifton, English engineer; b. Birkenhead, 1 Jan. 1848; d. 6 Nov. 1910. He joined the staff of George Francis Trainer and in 1860 assisted in the construction at Birkenhead of the first tramway in Europe. He was later engaged in similar work in America and Continental Europe as well as in England, building the pioneer system of cable and electric railways at Los Angeles, Cal. He was a pioneer of electric traction in London, designed and constructed the London United Electric Tramway system, and built the first electric tramway at Bristol in 1895. He was manager, director and engineer of the Imperial Tramway Company, and in 1902 was connected with the promotion of the great tube railway system in London. In 1906 he devised and successfully put into operation a system of through booking between the electric tramways and the underground railway systems of London. He was knighted in 1905. He was author of many articles and treatises on tramway construction.

ROBINSON, Doane (JONAH LEROY ROBINSON), American editor and historian; b. Sparta, Wis., 19 Oct. 1856. He was educated at the University of Wisconsin and was admitted to the bar in 1882. In 1884 he was editor of the *Courier* at Watertown, S. D., in the following year was secretary to the Territorial Railroad Commission of Dakota, and of the first Railroad Commission of South Dakota in 1890-91. Mr. Robinson edited *The Interstate* of Gary, S. D., in 1894 and the *Daily and Weekly Gazette* of Yankton, S. D., in 1896 and in 1898 organized the *South Dakotan Monthly* at Sioux Falls. He subsequently became State librarian, secretary and superintendent of the State Historical Society at Pierre, S. D. He published 'Coteaus of Dakota' (1899); 'History of South Dakota' (1900); 'History of Leavenworth's Expedition and Conquest of Ree Indians' (1902); 'History of Dakota' (2 vols., 1903); 'History of Sioux Indians' (1904); 'Brief History of South Dakota' (1906) and contributions to encyclopedias and periodicals.

ROBINSON, Edward, American Biblical scholar; b. Southington, Conn., 10 April 1794; d. New York, 27 Jan. 1863. He was graduated at Hamilton College in 1816 and went in 1821 to Andover to publish his edition of books i-ix,

xviii and xix of the 'Iliad'. There he aided Moses Stuart (q.v.) in the preparation of the second edition (1823) of the latter's 'Hebrew Grammar,' and rendered into English (1825) Wahl's *Clavis Philologica Novi Testamenti*. After European study, largely in Halle and Berlin (1826-30), he was professor extraordinary of sacred literature in the Andover Theological Seminary in 1830-33, and professor of Biblical literature in Union Theological Seminary from 1837 until his death. In 1838 and 1852 he visited Palestine with the scholarly missionary, Eli Smith, and there made careful surveys and investigations. His chief work, 'Biblical Researches' (1841; 3 vols. compressed into 2, with a 3d 1856), which obtained for him the Royal Geographical Society's gold medal, was based on these studies. He was a leading member of the American ethnological, geographical and Oriental societies, and edited in 1831-34 the 'Biblical Repository,' in 1843 the 'Bibliotheca Sacra,' with which the 'Repository' was incorporated, and for which he continued to write until 1855. Among his other publications are 'A Dictionary of the Bible' (1883); editions of Buttmann's 'Greek Grammar' (1833; 3d ed., 1851) and Genselius' 'Hebrew Lexicon' (1836; 5th ed. 1854), and Greek (1845; 2d ed., 1851) and English (1846) 'Harmonies of the Gospels.' Consult Hitchcock, 'Life, Writings and Character of Edward Robinson' (1863).

ROBINSON, Edward, American archaeologist: b. Boston, Mass., 1 Nov. 1858. He was graduated at Harvard University in 1879, later spending five years in study in Europe, including 15 months in Greece and three semesters at Berlin. He was curator of classical antiquities at the Boston Museum of Fine Arts in 1885-1902 and director in 1902-05. He became assistant director at the Metropolitan Museum of Art, New York, in 1906, and in 1910 succeeded Sir Caspar Purdon Clarke as director. He lectured on archaeology at Harvard in 1893-94 and in 1898-1902, and was secretary of the art commission of Boston in 1890-98. He has contributed many articles to periodicals as well as to the *Bulletin* of the Metropolitan Museum of Art.

ROBINSON, Edward Van Dyke, American economist: b. Bloomington, Ill., 20 Dec. 1867; d. 10 Dec. 1915. He was graduated at the University of Michigan in 1891 and took his Ph.D. at Leipzig in 1895. He was engaged in teaching and lecturing on commercial geography, physiography, economics and political science in 1895-1907; was appointed professor of economics at the University of Minnesota in 1907, and in 1915 accepted that chair at Columbia University. He was a contributor to scientific periodicals and was author of 'Nature of the Federal State' (1893); 'War and Economics' (1900); 'Text Book on Commercial Geography' (1909); 'Cost of Government, National, State and Local' (1912); 'Economic Conditions and the Development of Agriculture in Minnesota' (1915), etc.

ROBINSON, Edwin Arlington, American poet: b. Head Tide, Me., 22 Dec. 1869. He was educated at Gardiner, Me., and at Harvard University in 1891-93. His poetic work has been very well received by discriminating critics who have pronounced it thoroughly American

in tone and free of the meaningless twaddle all too common among our poets. His works are 'The Torrent and the Night Before' (1896); 'The Children of the Night' (1897); 'Captain Craig' (1902); 'The Town Down the River' (1910); 'Van Zorn,' a play (1914); 'The Porcupine,' a play (1915); 'The Man Against the Sky,' poems (1916); 'Merlin,' a poem (1917). See MERLIN; VAN ZORN.

ROBINSON, Ezekiel Gilman, American Baptist clergyman and educator: b. Attleborough, Mass., 23 March 1815; d. Boston, Mass., 13 June 1894. He was graduated at Brown University in 1838 and at Newton Theological Seminary in 1842. He held pastorates at Norfolk, Va., and Cambridge, Mass., in 1842-46; was professor of Biblical interpretation at the Western Theological Seminary, Covington, Ky., in 1846-50, and pastor at Cincinnati, Ohio, in 1850-53. He became professor of theology at the Rochester Theological Seminary in 1853 and president in 1860. In 1872-89 he was president of Brown University, and from 1893 until his death was professor of ethics and apologetics at the University of Chicago. He edited the *Christian Review* in 1859-64, and was author of 'Yale Lectures on Preaching' (1883); 'Christian Theology' (1894); 'Autobiography' (ed. Johnson, E. H., 1896), etc.

ROBINSON, Frederick Cayley, English artist: b. Brentford, Middlesex, 18 Aug. 1862. He studied at the Royal Academy Schools and in Paris and Italy. His work is characterized by much care in finish and has a certain tendency toward mediæval effects. He illustrated Genesis for the Medici Society and painted the mural decorations for the Middlesex Hospital in 1910-14. Among his earlier works are 'Outward Bound'; 'The Ferry'; 'Drifting'; 'Souvenir of a Past Age' (Adelaide Permanent Collection); 'The Foundling.' After studying in Italy he painted in a different style, his works including 'Fata Morgana'; 'Winter Twilight,' etc., and study in Paris influenced his later works, among which are 'The Deep'; 'Midnight'; 'Dawn'; 'Youth' (Cape Town Collection); 'The Fisherman' (Italian National Collection); 'Death of Abel' (Luxembourg, Paris), etc.

ROBINSON, Sir Frederick Philipse, English soldier: b. near New York, September 1763; d. Brighton, England, 1 Jan. 1852. He became ensign in 1777 in a Royalist American regiment, raised by his father, and fought in the battles of Horseneck, Stony Point and New London. He returned to England in 1784; entered the West India service in 1794 and was present at the capture of Martinique, Saint Lucia and Guadeloupe. He became colonel in 1812 and commanded a brigade in the Peninsula campaign of 1813, where he fought gallantly; was promoted major-general in 1814 and rewarded with a medal. He took part in the engagement before Plattsburg in 1814 during the war with the United States, and in 1816 left Canada for the West Indies, where he was put in command of the troops in the Windward and Leeward islands and for a time was governor of Tobago. In 1841 he became general. At the time of his death he was the soldier of longest service in the British army.

ROBINSON, Frederick William, English novelist: b. London, 23 Dec. 1830; d. there, 6 Dec. 1901. He was educated at Clarendon House, Kensington, and in 1851 began his career as a novelist, though he frequently contributed special articles to periodicals and for five years wrote dramatic criticisms for the *Daily News*. He founded and edited *Home Chimes*, which ran as a weekly two years and then became a monthly. He was a prolific writer and over 50 titles of novels stand to his credit. Some of them are as follows: 'The House of Elmore' (1855); 'One and Twenty' (1858); 'No Church' (1861); 'Female Life in Prison' (1862); 'A Woman's Ransom' (1864); 'Beyond the Church' (1866); 'Stern Necessity' (1870); 'Her Face Was Her Fortune' (1873); 'Second Cousin Sarah' (1847); 'The Romance of a Back Street' (1878); 'Lazarus in London' (1885); 'The Keeper of the Keys' (1890); 'The Secretary' (1895); 'Sweet Nineteen' (1896). His skillfully constructed and fluently told fictions were as popular in this country as in his own.

ROBINSON, Geoffrey, English journalist: b. 1874. He was educated at Oxford, was a Fellow of All Souls' College in 1898, and in 1901-05 he was private secretary to Lord Milner in South Africa. He edited the *Johannesburg Star* in 1905-10; was afterward South African correspondent for the *London Times*, and from 1912 was editor and director of the *Times*.

ROBINSON, Henry Crabb, English barrister and diarist: b. Bury Saint Edmunds, 3 May 1775; d. London, 5 Feb. 1867. In 1796 he entered a solicitor's office in London, and in 1800 went to Germany, where he spent five years in studying at Jena and elsewhere, and in making the acquaintance of Goethe, Schiller, Wieland, Herder, Kotzebue and other noted Germans. In 1807 he went to Altona as *Times* correspondent, and in 1808-09 was war correspondent in Spain for the same newspaper. He was called to the bar in 1813, and practised until 1828. He was associated with the foundation of the University of London in 1828. His fame as a conversationalist approached that of Rogers, but he never made any serious attempt to gain distinction as a writer. His intimate acquaintance with many of the greatest men and women of his time, both in his own country and on the Continent, such as Wordsworth, Lamb, Coleridge, Southey, Flaxman and Clarkson, gives peculiar interest and value to the selections from his 'Diary, Reminiscences, and Correspondence,' edited by Sadler in 1869. He was one of the founders of the Athenæum Club and of University College, London. Consult Vincent, L. H., 'Dandies and Men of Letters' (Boston 1913).

ROBINSON, Sir Hercules George Robert, 1st BARON ROSMEAD, British colonial governor: b. 19 Dec. 1824; d. London, 28 Oct. 1897. He was educated at Sandhurst and was commissioned in the 87th regiment (Irish Royal Fusiliers) in 1843. He retired from the army in 1846 and became commissioner of public works for Ireland, rendering admirable service during the Irish famine of 1848. In 1854 he was appointed president of Montserrat in the West Indies, and in 1855 he became lieutenant-governor of the neighboring island of Saint Christopher, where he introduced coolie labor

from India with excellent results. In 1859 he was promoted governor of Hongkong and was in office during the war with China in 1860-61. He was governor of Ceylon in 1865-68 and reorganized its public works department so that it became a model in British colonial administration. He was governor of New South Wales in 1872-79, negotiating the cession of the Fiji Islands, and in 1879 he became governor of New Zealand. He was appointed governor of Cape Colony and high commissioner of South Africa in 1880, arriving in January 1881, and was called upon to establish the peace following the first Boer War. His administration was exceedingly able under circumstances of marked difficulty. He labored earnestly to establish a responsible colonial government and to institute cordial relations between the British and Dutch settlers, besides improving internal communication and opening new territory. He was continued in office two years beyond the usual term of a governor and received a baronetcy in 1891. In 1895, at the urgent request of Lord Rosebery's government, he returned to South Africa and resumed his former position. The Jameson raid, carried out without his knowledge, brought his negotiations with the South African Republic to an end. He secured the release of the raiders but could do little to remedy the troubles which resulted in the War of 1899, although at the time of his departure in May 1896 he had established comparative calm. He was created Baron Rosmead in 1896.

ROBINSON, James Harvey, American historian and educator: b. Bloomington, Ill., 29 June 1863. He was graduated at Harvard in 1887 and took his Ph.D. at Freiberg in 1890. In 1891 he was lecturer on European history at the University of Pennsylvania; and in 1892-95 he was assistant professor of history at Columbia University, where he has held the chair of history since 1895, acting also as dean of Barnard College in 1900-01. He is favorably known for his original methods and broad scope as a teacher of history. He edited the *Annals of the American Academy of Political and Social Science* in 1891-95; and since 1911 has been associate editor of the *American Historical Review*. He was joint editor of 'Translations and Reprints from the Original Sources of European History'; and joint author of 'Petrarch, the First Modern Scholar and Man of Letters' (1899); 'Development of Modern Europe' (2 vols., 1907); and 'Readings in Modern European History' (2 vols., 1908-09). Author of 'The German Bundesrath' (1891); 'Introduction to the History of Modern Europe' (1903); 'Readings in European History' (2 vols., 1904-05); 'The New History' (1911), etc.

ROBINSON, John, English Independent clergyman: b. Lincolnshire, about 1576; d. Leyden, Holland, 1 March 1625. It has been widely assumed that he was educated at Corpus Christi College, Cambridge. He was, say certain later writers, suspended from a benefice in Norfolk. He himself mentions a residence in Norwich, where he was religious director of a band of worshippers, and where certain persons were excommunicated for their interest in his instruction. In 1608 he emigrated to Amsterdam, with several of the congregation of the church

at Scrooby Manor, Nottinghamshire, and thence in 1609 to Leyden, where he was ordained pastor, with William Brewster (q.v.) as ruling elder. In 1611 a building was purchased for 8,000 guilders for use as a meeting-house. Mather in his 'Magnalia' says that "those famous divines, Polyander and Festus Hommius, employed this our learned Robinson to dispute publicly in the University of Leyden against Episcopius, and the other champions of that grand choke-weed of true Christianity" (Arminian doctrine). There may be some foundation for the story of such a disputation; but it was probably not at Polyander's request, nor at the university, where Episcopius was in power. Robinson was admitted to the university in 1615 and attended Episcopius' lectures. He took a very active interest in the project for emigration to America; and had a majority of his church volunteered would have accompanied them hither. Previous to the sailing of the *Speedwell* he preached on 21 July 1620, observed as a day of prayer and humiliation. His celebrated address is given in Winslow's 'Hypocrisie Unmasked' (1646), the author remarking that Robinson "used these expressions, or to the same purpose," and some allowance must be made for such improvements and embellishments as Winslow may have made to suit his controversial purpose. Robinson corresponded with the "church of God at Plymouth, New England." Mather calls him "a most wise, grave, good man," and Robert Baillie, "the most learned, polished, and modest spirit" among the Separatists. A tablet marks the house in which he lived in Leyden, and Peter's Church, where he is buried, also contains a bronze memorial. His 'Works,' with memoir and notes of Robert Ashton, appeared in 1851. The most important of his works which were published were 'A Justification of Separation from the Church of England' (1610); 'Of Religious Communion' (1614); 'Essays or Observations Divine and Moral' (1625). Consult Bradford, 'History of Plymouth Plantation' (Coll. of the Mass. Hist. Soc., 4th ser., Vol. III, 1856); Mather, 'Magnolia' (1702); Neal, 'History of New England' (1720); Brook, 'Lives of the Puritans' (1813); Dexter, 'Congregationalism of 300 Years' (1880); 'Life' by Davis (1903); Burrage, Champlin, 'New Facts Concerning John Robinson' (Oxford 1910).

ROBINSON, Sir John Beverley, Canadian jurist and statesman: b. Berthier, Quebec, 26 July 1791; d. Toronto, 31 Jan. 1863. He was educated under Dr. John Strachan at Kingston and was admitted to the bar in 1814. He served as clerk of the assembly of Upper Canada in that year, and in 1815 read law at Lincoln's Inn, London. Returning to Canada he became Solicitor-General, and he was leader of the Conservatives in Upper Canada in 1818-29. He was speaker of the Legislative Council in 1828-40; and from 1829 until shortly before his death he was chief justice of Upper Canada. His reputation as a justice was high, not one of his decisions ever being reversed on an appeal. He was opposed to the union of the two Canadas, but upon its accomplishment he rendered invaluable assistance in adjusting financial arrangements, receiving the thanks of the Upper Canadian assembly. He was a Tory of pronounced opinions and was by many considered

a reactionary, but admittedly possessed the highest principles and sound patriotism. He wrote several pamphlets, the most notable being his argument against the Canadian union, 'Canada and the Canada Bill' (1839). He was created a baronet in 1854. Consult Robinson, C. W., 'Life' (1904) and Dent, J. C., 'Canadian Portrait Gallery' (Vol. IV, 1881).

ROBINSON, John Cleveland, American soldier: b. Binghamton, N. Y., 10 April 1817; d. there, 18 Feb. 1897. He entered West Point in 1835, but withdrew in 1838 to study law, accepting, however, a commission as 2d lieutenant in 1839. He was engaged in the Mexican and Seminole wars, was promoted captain in 1850 and at the outbreak of the Civil War was commissioned colonel of volunteers. He was in command of Fort McHenry at the opening of the war; successfully defended it, and was later engaged in organizing volunteer troops. He commanded a brigade in the Army of the Potomac in the Seven Days' battle before Richmond; was present at the battles of Fredericksburg, Chancellorsville, Gettysburg, Wilderness and Spottsylvania, and in the last lost a leg and was prevented from further active service. He was voted a medal of honor by Congress; was brevetted major-general of volunteers in 1864 and of regulars in 1865. In 1866 he was mustered out of the volunteer service and accorded rank as colonel in the regular army. He was in command of the Department of the South in 1867, of the Lakes in 1868-69, and in the latter year was retired with rank of major-general. He was elected lieutenant-governor of New York in 1872, was commander-in-chief of the G. A. R. in 1877-78, and president of the Society of the Army of the Potomac in 1887-88.

ROBINSON, Joseph Armitage, English clergyman: b.—. He was educated at Cambridge, took priest's orders in the Established Church in 1882 and was vicar of All Saints, Cambridge, 1888-92. From 1893 to 1899 he was Norrisian professor of divinity at Cambridge, and was prebendary of Wells' Cathedral 1894-99. He was rector of Saint Margaret's, Westminster, 1899-1900, canon of Westminster 1899-1902, and in the year last named succeeded Dean Bradley as dean of Westminster Abbey. He has published 'A collection of the Athos Codes of the Shepherd of Hermas' (1888); 'Appendix to the Apology of Aristides' (1891); 'The Passion of Saint Perpetua' (1891); 'The Philocalia of Origen' (1893); 'Euthaliana' (1895); 'Unity in Christ' (1901); 'The Study of the Gospels' (1902); 'Some Thoughts on the Incarnation' (1903); 'Commentary on the Epistle to the Ephesians' (1903; 2d ed., 1904); 'On the Athanasian Creed' (1905); 'The Vision of Unity' (1908); 'The Advent Hope in Saint Paul's Epistles' (1911); 'Holy Ground' (1914).

ROBINSON, Sir Joseph Benjamin, South African capitalist: b. Cradock, Cape Colony, 3 Aug. 1840. He engaged in wool-burying and farming until 1867, increasing his holdings to 20,000 acres at Vaal River after the discovery of diamonds. He was the discoverer of the Langlaagte gold mine and became owner of the Radfontein gold fields. He was mayor of Kimberly in 1880, and was for four years a member of the Cape Parliament, in which time he secured the passage of the Diamond Trade Act.

He fought for the Free State in the Basuto War. He was created a baronet in 1908.

ROBINSON, Joseph Taylor, American senator: b. Lonoke, Ark., 26 Aug. 1872. He was educated at the University of Arkansas, was admitted to the bar in 1895 and engaged in practice at Lonoke. He was elected to the general assembly in 1895, and in 1903-13 was a member of Congress. He resigned from Congress in 1913 after his election as governor of Arkansas, but a few days after taking office he resigned that post also in order to accept an appointment to the United States Senate, succeeding Jefferson Davis for the term ending in 1919. He was re-elected for the term ending in 1925.

ROBINSON, Robert, English preacher and hymn writer: b. Swaffham, Norfolk, 27 Sept. 1735; d. Birmingham, 9 June 1790. Lack of funds prevented his studying for the Anglican ministry, but he came under the influence of Whitefield in 1752, and in 1758 became a preacher. A year later he joined the Baptist faith, preaching at the Stone Yard Baptist Chapel, Cambridge, for two years before he was ordained pastor. He became popular as a preacher, built a new church in 1764 and without neglecting his clerical duties supported himself by farming and a corn and coal business. He later became practically a Unitarian, and after 1783 left the Baptist Church, engaging in preaching at Chesterton and Birmingham. Of his hymns two are still in use, 'Come Thou Fount of Every Blessing' and 'Mighty God While Angels Bless Thee.'

ROBINSON, Stuart, American Presbyterian clergyman: b. Strabane, near Londonderry, Ireland, 26 Nov. 1814; d. Louisville, Ky., 5 Oct. 1881. He was graduated at Amherst College in 1836, studied theology at Union Seminary, Prince Edward, Va., and was ordained in 1841. He was pastor at Kanawha Salines, W. Va., 1841-47, in 1856-58 professor of ecclesiology in the Presbyterian Seminary at Danville, Va., and then became pastor at Louisville. He edited the *True Presbyterian*, which was suppressed by the government in 1862 for disloyalty, and he then moved to Toronto. In 1865 he published 'Slavery as Recognized by the Mosaic Civil Law, and Allowed in the Abrahamic, Mosaic and Christian Church,' and in 1866 resumed his Louisville pastorate and reissued his paper as *The True Christian Commonwealth*. His persistence in expressing his former views led to his expulsion from the Presbyterian General Assembly, and by his influence the Kentucky synod joined the Southern General Assembly in 1869, which body made him its moderator. He was a delegate to the Pan-Presbyterian council at Edinburgh in 1877. He wrote 'The Church of God an Essential Element of the Gospel' (1858), and published 'Discourses of Redemption' (1866).

ROBINSON, Theodore, American artist: b. Irasburg, Vt., 1852; d. New York, 2 April 1896. He studied under Carolus-Duran and Gérôme in Paris and under Claude Monet at Giverny. He opened a studio in New York, devoted himself chiefly to landscape and figure painting and became a leader of the Impressionist school. He was awarded the Webb prize for his 'Winter Landscape' (1890), and the Shaw prize for his study of a peasant girl

'In the Sun' (1892). Among his works are 'A Bridge'; 'In the Sunlight'; 'On the Tow Path'; 'West River Valley—Vermont'; 'Giverny' and 'Girl with Cow' (Metropolitan Museum); 'Correspondence,' etc.

ROBINSON, Theresa Albertine Louise von Jakob, German-American author: b. Halle, Prussia, 26 Jan. 1797; d. Hamburg, 13 April 1870. She was the second wife of Edward Robinson (q.v.), and was known in Germany as an author under the name of 'Talvj' (formed from her initials). While residing at Kharkoff she began to study Slavonian, and wrote her first poems. In 1824 she published a few tales in a volume bearing the title 'Psyche.' She also published, in 1825-26, translations of a number of Serbian popular songs entitled 'Volkslieder des Serben.' In America she began the study of aboriginal languages and translated into German Pickering's work on the Indian tongues. In 1834 she wrote a 'Historical Review of the Slavic Languages' for the 'Biblical Repository,' republished in enlarged form in 1850. During her husband's visit to Palestine she resided in Germany, where she published, in 1840, 'Charakteristik der Volkslieder germanischer Nationen mit einer Uebersicht der Lieder ausseruropäischer Völkernschaften.' 'Die Colonisation von Neu-England' was published at Leipzig in 1847; a defective translation by W. Hazlitt, Jr., appeared in London in 1851. She also wrote numerous tales, and contributed to magazines, both German and English. 'Heloise,' 'Life's Discipline' and 'The Exiles' were German tales translated into English by her daughter (1850-53). 'Fifteen Years: A Picture of the Last Century' appeared in 1870, and 'Gesammelte Novellen' in 1874.

ROBINSON, William Erigena, American journalist and legislator: b. Unagh, County Tyrone, Ireland, 1814; d. Brooklyn, N. Y., 23 Jan. 1892. He emigrated to the United States in 1836, took out his first naturalization papers in 1837 and in 1841 was graduated at Yale University. He later engaged in journalism; was on the staff of the *New York Tribune* in 1844-48, writing under the pseudonym 'Riche-lieu,' a name he used for occasional writings until his death. He engaged in law practice in New York in 1854; was assessor of internal revenue for Brooklyn in 1862-67, and served in Congress in 1867-69 and in 1881-84. He secured the passage of a bill to protect the rights abroad of naturalized as well as native-born citizens, and was an advocate of penny postage and of Cuban independence. In 1847-48 he organized the movement for the relief of the famine in Ireland.

ROBINSON, William S., American landscape painter: b. East Gloucester, Mass., 1861. He studied in Boston, France and Holland. He was instructor in art at Maryland Institute, Baltimore, in 1885-89; at Drexel Institute in 1891-93; at the Pennsylvania Academy of Fine Arts in 1892-99, and at Columbia University in 1894-1904. He took honors at the Paris, Buffalo, Saint Louis and Panama Expositions, and in 1900 was elected to the National Academy. Among his works are 'The Golden Bough' (Carnegie Institute, 1908); 'White Birches' (1913); 'Whiteface Chasm, Monhegan' (1913); 'September' (1915); etc.

ROBINSON, Ill., city, county-seat of Crawford County, on the Wabash River, and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Illinois Central railroads, 45 miles southwest of Terre Haute, Ind. It was settled in 1842, when it became the county-seat; was incorporated as a village in 1866 and as a city in 1886. It is the trade centre of a fruit and grain-growing and sheep-raising region, and contains a few small mills, an oil refinery and oil-well supply works, hospital and sanitarium. It has four banks. It contains a township high school founded in 1885, with a school library of over 600 volumes and a Carnegie library, an Elk's home, Federal building and courthouse. The city is governed by a mayor and a council of 12; the members of the council are elected for two years, six being chosen each year. Pop. 5,500.

ROBINSON CRUSOE, the best-known work of Daniel Defoe and one of the most widely read of all modern books, was published at London, on or about 25 April 1719, by William Taylor at the Sign of the Ship in Pater Noster Row, in an octavo volume somewhat exceeding 350 pages, with a frontispiece representing the hero in his goatskin clothes, and under the following show-case or display title: "The Life and Strange Surprising Adventures of Robinson Crusoe, of York, Mariner: Who lived Eight and Twenty Years, all alone in an uninhabited Island on the Coast of America, near the Mouth of the Great River of Oroonoke; Having been cast on Shore by Shipwreck, wherein all the Men perished but himself. With An Account how he was at last as strangely deliver'd by Pyrates. Written by Himself." It was a rather expensive, not ill-looking book, marred, however, by a considerable number of typographical blunders.

Defoe at the time of its publication was apparently in his 60th, possibly in his 61st year. He was very widely but not favorably known as a bankrupt merchant who more than 20 years before had turned pamphleteer and politician. His satire 'The True-Born Englishman' (1701) had brought him fame, but shortly afterward he was ruined through his exposure in the pillory and his imprisonment for writing his ironical tract 'The Shortest Way with the Dissenters,' and he became in consequence a political journalist, a secret government agent and a miscellaneous writer whose pen was supposed to be as venal as it was prolific. Since the accession of the Hanoverians in 1715 he had been much attacked for his relations with Jacobite newspapers, the fact that he was in reality employed by the government to watch them not being generally known. Of his thousands upon thousands of pages in periodicals, pamphlets and books nearly all had been anonymous, and, while his style often betrayed him, he had been detected in writing nothing that on the surface markedly resembled 'Robinson Crusoe.' Yet it was not long before his hand was recognized in that, a fact which led to some rather stupid criticism of the book; and in our own day certain preliminary essays of his in more or less fictitious writing have been discovered, which make his success in the new vein, which he soon began to practise assiduously, somewhat less surprising than it would have been had he suddenly changed to an

unwonted field of composition and produced a masterpiece. That something novel and important had been added to English fiction was speedily shown by the unparalleled popularity of 'Robinson Crusoe,' in its full form, in cheap abridgments, in translations and in frank imitations. We do not know the size of the editions, but we do know that before the end of 1719 there were probably six authorized impressions, a Dublin reprinting and several piratical issues, not counting serial publication in a newspaper. No previous English story had been so circulated, and by August 1719 the canny author had presented the public with a second instalment of his hero's history, likewise published by Taylor, 'The Farther Adventures of Robinson Crusoe; Being the Second and Last Part of his Life, And of the Strange Surprising Accounts of his Travels Round three Parts of the Globe.' This, while fairly popular and a creditable piece of travel-fiction, was not, as Defoe fondly thought, contrary to the usage of second parts "every Way as entertaining as the First," a verdict which applies with still greater force to the so-called third part published by Taylor a year later (1720), really not fiction at all but a volume of essays entitled 'Serious Reflections during the Life and Surprising Adventures of Robinson Crusoe: With his Vision of the Angelick World.' Both of these parts, like the first, bore the legend "Written by Himself," for those were days when serious people denounced fiction as "lies," and Defoe indulged in some curious exegesis in his prefaces in order to justify to his Non-Conformist's conscience his lucrative story-writing.

To follow the fortunes of 'Robinson Crusoe' after 1719 would require a large volume. Here only a few salient facts can be given. At least three additional authorized reprintings were needed before Defoe died in 1731, quaint illustrations were introduced, several abridgments appeared, one of which, apparently made by Defoe himself and covering all three parts, went through numerous editions during the next hundred years, the three parts were translated into Dutch, French and German, and a large number of imitations made unsuccessful attempts to rival the popularity of the original, although in some cases attaining themselves considerable vogue. The story took root more strongly perhaps in Germany than in any other foreign country, but it was and remained very popular in France, and before many years had elapsed Italians also could read it in their native tongue. It has since been translated into all sorts of languages and dialects, it has fascinated wandering Arabs, it is taught to school children in our island possessions and it is accessible in Esperanto. One of the largest collections of "Crusoes," that of Mr. William S. Lloyd of Philadelphia, contains some 400 volumes, but unrecorded issues in English and in other tongues are continually coming to light. Some of the modern editions are true works of art, very distinguished artists, especially in France, having striven to illustrate adequately so famous a book.

It has naturally attracted also both scholars and literary critics and gossips, with the usual darkening of counsel. It may fairly be said that scarcely one of the numerous stories and speculations about Defoe and his chief book

will bear investigation. He cannot be shown to have made misuse of Selkirk's papers, it is highly unlikely, to say the least, that Robert Harley, Earl of Oxford, had anything to do with writing the first part, it is far from certain that Defoe had any difficulty in getting that part published, it could not possibly have been written at most of the places assigned for its composition, and was probably thrown off hastily at Defoe's house at Stoke Newington not long before it was issued, and, finally, all attempts to see in the book a serviceable allegory of Defoe's life, however much support they may receive from his sophisticated prefaces, are likely to prove valueless and not a little absurd. The truth is that scarcely anything definite is known about the origin of the great story except that it is clearly Defoe's, since it was assigned to him by fellow-journalists of the time, and since in all three parts, from first page to last, the minute student finds the stylistic evidence of his authorship overwhelming, and that doubtless the occasion for Defoe's attempting to describe the life of a shipwrecked sailor upon a far-off deserted island was the publication of accounts by Capt. Woodes Rogers, Capt. Edward Cooke, Sir Richard Steele and others of the strange adventures of the Scotch sailor Alexander Selkirk or Selcraig, during a more than four years' solitary sojourn on the island of Juan Fernandez off the coast of Chile. That this is not Crusoe's island the very title-page of the book plainly shows—many persons, inquisitive in small matters, seem to be unduly positive that Tobago should have that honor—but it is about as clear as such things can ever be that poor Selkirk's story influenced Defoe. He may have taken hints from the experiences of other castaways and from other narratives of travel, also—indirectly if at all—from Grimmelshausen's 'Der abenteuerliche Simplicissimus' and from a Dutch story, Hendrick Smeeks' 'Beschrijvinge van het magtig Koninkrijk Krinkle Kesmes'; but in the main most of the 'sources' for the masterpiece discovered by indefatigable scholars are imaginary or at best barely possible, and 'Robinson Crusoe,' like 'Paradise Lost' and many of Shakespeare's plays, may truly be said to derive its greatness from the appeal of its subject matter and from its author's own genius. It is doing Defoe no injustice to say that, on the whole, it is the exceptional interest attaching to the central part, the island portion, of the first volume of 'Robinson Crusoe' that has contributed most to giving the story its extraordinary currency. The third volume, the 'Serious Reflections,' while not without merit, has been but seldom reprinted and is little known. The second volume, 'The Farther Adventures,' possesses more merit and has been many times reprinted to accomplish the first, but it is seldom specially in mind when the book is mentioned. Even the extra-island portions of the first volume—the experiences in Africa and Brazil and the concluding journey through Spain—good of their kind though they are—do little to make the book impressive. What profoundly impresses us is the frightful loneliness, the struggle of the ordinary sailor-hero against what seem to be overwhelming odds, his final success, although his endowments, except perhaps in physical resistance, are no higher than we may well

suppose our own to be. Our sympathy and our curiosity—two mighty elements in the success of a book if the author can but arouse them thoroughly—are brought into play from the shipwreck to the departure, although some may experience a slight flagging of interest after the life with Friday has been described. "Would I have thought of doing that?" is the question, however egotistical, that continually presents itself, and in reflecting upon it we can legitimately bring Defoe in for a high share in the praise we bestow on his book. 'Robinson Crusoe' through the universality of its appeal has much of the carrying power of the world's greatest poems, but Defoe, although possessed of more imagination than is often given credit for, was not a great poet. He was, however, as a journalist and much experienced, versatile and wideawake man, endowed with qualities that stood him in good stead when he began his book at a remarkably late period in life for the inception of new literary enterprises. His English, if careless, was easy and unaffected, his methods of narration were straightforward, and he had not only a very large knowledge of character and of the details of life but an exceptional power of lending vividness and reality to whatever he described. This last he attained chiefly through a skilful use of minute features and circumstances, which beguile the reader into belief of all he is told. It may be at bottom a journalistic faculty, but, as Defoe seems to be the only professional journalist who has a 'Robinson Crusoe,' a 'Moll Flanders,' and a 'Journal of the Plague Year' to his credit, it would seem either that he was a good deal more than a journalist, or else that critics need to revise their notions as to what the term "journalistic" should connote.

We have already seen that Defoe had made some mild attempts at semi-fictional writing before the second edition (1718) of Woodes Rogers' 'Cruising Voyage' brought, in all probability, the story of Selkirk, much in evidence six years before, once more to his attention. An omnivorous reader, he undoubtedly knew the work of preceding picaresque writers, like the author of 'The English Rogue,' as well as that of Mrs. Aphra Behn, but in the main his contribution to English fiction was original. He had learned early as a pamphleteer to narrate and to describe in a lifelike fashion—*vide* his 'True Relation of the Apparition of one Mrs. Veal' (1706)—and he had also learned to manage dialogue and to tell anecdotes effectively. Later he had learned how to construct books of some length and to make them less and less sprawling; he had even begun to create characters and to move in imagination in foreign countries and in the past—*vide*, his 'History of the Wars' of Charles XII of Sweden (1715) and his 'Continuation' of the famous 'Letters' supposed to be written by a 'Turkish Spy' (1718). Shorter pieces more specifically fictitious might be added to these, but the main point is that he had gradually, probably without knowledge of it or conscious purpose of any sort, been assembling the qualities and materials necessary to the writing of fiction. The story of Selkirk supplied the occasion, the spark, and Defoe was doubtless influenced also by the facts that he now lived

at home, being no longer sent by the government on tiresome journeys, and that, writing as he did with great ease, the more books he could produce, the more money he could lay by to furnish dowries for several daughters, to whose attractiveness one of his future sons-in-law, the naturalist. Henry Baker, has borne testimony. In some such uninvolved and human way, we may imagine, one of the most uninvolved and human books ever written came into existence, and it was in giving this book, not merely to his countrymen, but to the world, and in showing other writers what it was to be uninvolved and human in their stories that Daniel Defoe proved himself to be a benefactor to the race. To the student he is in his mixed character and in his perplexing career one of the most interesting of men; to the masses of mankind he is and will always remain "the Author of Robinson Crusoe," a name and little else. The thing created has swallowed its creator, which is not far from being the highest tribute that can be paid to any achievement.

Convenient editions of 'Robinson Crusoe' may be found in the Globe, Golden Treasury and other well-known series, and in the late George A. Aitken's edition of Defoe's 'Romances and Narratives.' The text of most editions, however, leaves much to be desired. The writer has endeavored to supply an accurate text of the first part in a school edition published in 1916 by Ginn and Company, and he has an edition of the same part with full apparatus in the press of the same firm.

W. P. TRENT.

ROBLIN, rōb'līn, Sir Rodmond Palen. Canadian statesman: b. Sophiasburgh, Ontario, 15 Feb. 1853. He was educated at Albert College, Belleville; settled in Manitoba in 1880; and engaged in farming on an extensive scale, also becoming a grain merchant. He was elected to the Manitoba legislature in 1888, and in 1900-13 was Premier, Minister of Agriculture and Railway Commissioner for that province. He was an opponent of the projected Reciprocity Agreement with the United States in 1911. In 1912 he was knighted.

ROBSON, Eleanor Elsie (Mrs. AUGUST BELMONT), American actress: b. Wigan, Lancashire, England, 1879. She was graduated at Saint Peter's Academy, Staten Island, N. Y., in 1897 and made her stage début at San Francisco in that year. She achieved a success in New York as Bonita in 'Arizona,' and later played leading parts in many successful productions. She played Juliet to Kyrle Bellew's Romeo in 1903 and headed an all-star cast in 'She Stoops to Conquer' in 1905. She starred in 'Merely Mary Ann' in 1903-05, winning high praise in both London and New York; and won her greatest success in 'The Dawn of a Tomorrow' in 1908-10. She retired from the stage upon her marriage in 1910.

ROBURITE, an explosive patented by Dr. Roth in 1887. It consists of dinitrochlor-benzene mixed with ammonium nitrate, and must be used dry. The detonation of the mixture is to be effected by means of fulminate of mercury. Roburite burns quietly, and is not sensitive to shock. Its most successful use has been in the mining of coal, where it is valuable not only because it causes little dust, but also be-

cause it allows of blasting the coal in large blocks.

ROBUSTI, rō-boos'tē, Jacopo. See TINTORRETTO.

ROC, rōk, a mythical bird of enormous size, supposed to have been able to perform wonderful feats of strength and ferocity. The most popular accounts of the roc are given in 'The Arabian Nights' Entertainments,' where the bird plays an important part in the fortunes of Sinbad the Sailor. Sinbad describes the roc as white, with a claw as large as the trunk of a large tree and with a beak of prodigious size and sharpness. Its egg he declares to be 50 paces in circumference, about 150 feet. Another writer computes that the egg of the roc is equal to 150 hens' eggs. The bird is described as a bird of prey, "able to bear an elephant away in its talons," and "killing the moa, which it bore to its nest and destroyed to provide food for its young." Consult 'The Arabian Nights' Entertainments' for the accounts of the second voyage, and the third Calendar's Story. Attempts have been made to identify the roc with the so-called elephant-birds of Madagascar and New Zealand, but it is asserted by naturalists that neither this huge bird (which is not a bird of prey) nor the *Harpagornis*, the largest known rapacious bird, could have performed the feats commonly attributed to the roc. There were described to the Parisian Academy of Sciences the fossils of an enormous bird called the *Aepyornis* and two of its eggs, fossil remains of which had been discovered. (See reports for first quarter, 1851). This little-known colossal form has been accepted as the nearest approach to the fabulous roc. Consult Lane, E. W., 'Arabian Nights' Tales and Anecdotes' (London 1845), and Yule, Sir Henry, in 'Book of Marco Polo' (ib. 1871).

ROCA, rō'kā, Julio Argentino, Argentine statesman: b. Tucuman, Argentina, 1 July 1843; d. 1914. He was trained in the Paraná Military School, entered the army and in 1874 became general. In 1878-80 he was War Minister, and as such headed in person the expedition which subdued the Patagonian Indians. From 12 Oct. 1880 to 12 Oct. 1886 he was President of the republic. It was during his administration that the serious Argentine financial crisis occurred. In 1890-92 Roca was Minister of the Interior in the Pelligrini administration. He was elected President for a second term in 1898, and during the ensuing six years promoted a sound financial policy, furthered public improvements and averted a crisis with Chile. He was sent as Ambassador to Brazil in 1904 and later held a similar post at Paris.

ROCAFUERTE, rō-kā-foo-ār'tā, Vincente, South American statesman: b. Guayaquil, Ecuador, 3 May 1783; d. Lima, Peru, 16 May 1847. He was educated in France and England, and in 1812 was elected to the Spanish Cortes by Guayaquil, but his opposition to the policies of Ferdinand VII was resented and he was obliged to escape to France. He went to Lima, and to the United States in 1819, and in 1824 to Mexico, where he became secretary to General Michelena. He accompanied him to England, and after the recognition of Mexico's independence and Michelena's return he remained in England as charge-d'affaires. In 1830 he re-

signed and returned to Mexico, where he edited the *Fénix de la Libertad*. He went to Guayaquil in 1833, and was soon after elected deputy to Congress for the province of Pichincha, but was exiled because of his opposition to the administration. The province of Guayaquil then revolted against General Flores and proclaimed Rocafuerte as supreme chief. He was defeated and captured by Flores, but an amicable arrangement was soon afterward made, co-operation in the reorganization of the republic was agreed upon and Rocafuerte served as President in 1835-39. His administration was one of ability. He introduced many reforms and placed the financial affairs of the country on a sound basis. His after life was spent in various diplomatic missions, in which he sustained his high reputation as a statesman. He wrote 'Ideas necesarias á todo pueblo independiente, que quiere ser libre' (1820); 'Ensayo sobre tolerancia religiosa bajo el aspecto politico y como medio de colonizacion y de progreso' (1831), etc.

ROCAILLE, rô-kal-ê'. See **Rococo**.

ROCAMBOLE, a perennial species of onion (*Allium scorodophrasum*) whose bulbs resemble those of the garlic; but the cloves are smaller. It is cultivated for the same purposes, and is considered more delicate flavored. Its chief use in America is among the French-Canadians.

ROCHA PITTA, Sebastião, sã-bãs-tê-ã'-foo rôsh'ã pét'tã, Brazilian author: b. Bahia, Brazil, 3 May 1660; d. near there, 3 Nov. 1738. He was a leisurely student, and the author of some commonplace verse and fiction. He made very elaborate preparations for his 'Historia da America Portuguesa desde o seu Descobrimento até o Anno 1724' (1730), which won for him deserved success and numerous honors. The book was the first history of Brazil in any true sense, and the material it contained has proved of much value to subsequent workers in that field.

ROCHAMBEAU, rô-shãh-bô, Jean Baptiste Donatien de Vimeur, COMTE DE, French marshal: b. Vendôme, 1 July 1725; d. Thoré, 10 May 1807. He was the son of the governor of his native town and was brought up for the Church, but at 17 entered the army. He fought with distinction in the war of the Austrian Succession, attained the rank of colonel and in 1749 succeeded his father as governor of Vendôme. During the Seven Years' War he did excellent service in Minorca (1756) and later in Germany, winning the rank of brigadier-general. He was made lieutenant-governor in 1780 and in the same year was dispatched at the head of an army of 6,000 men to co-operate with the American forces in the War of Independence. In July he landed in Rhode Island and, intrenching himself at Newport, held his position until June of the following year, when, in pursuance of a plan of campaign arranged between Rochambeau and Washington, the French troops, reinforced by some 3,000 men, marched across Connecticut and joined the American army on the Hudson near Dobbs Ferry, whence was begun the southward march for Yorktown. The city was invested on 29 September and after two brilliant assaults by the French troops and the defeat of the English fleet by the

French under De Grasse in Chesapeake Bay, Cornwallis surrendered. Rochambeau's services to the American cause were enhanced by the utter absence of jealousy or self-assertion on his part; he placed himself implicitly under Washington's orders and within his own army maintained the sternest discipline. Congress voted its thanks to the French commander for his valuable services and presented him with two guns taken at Yorktown. Returning to France in 1783, he took part in the earlier events of the French Revolution and after being raised to the rank of field-marshal was given in 1791 command of the Army of the North. Regarding with disfavor the progress of the Revolutionary policy, he resigned in June 1792 and soon after was imprisoned at Paris, regaining his liberty at the end of the Reign of Terror in 1794. In 1804 Napoleon made him an officer of the Legion of Honor. A statue of Rochambeau was erected at Vendôme in 1899 and a replica of it, a gift of the French republic to the United States, in Lafayette square, Washington, was unveiled with much ceremony in 1902 by President Roosevelt. He left behind him 'Memoires du Maréchal de Rochambeau' (1890), translated, in part, into English by M. W. E. Wright (1838) under the title 'Memoirs of the Marshal Count de Rochambeau Relative to the War of Independence of the United States.' For his correspondence during his term in America consult Daniel, 'Histoire de la participation de la France à l'établissement des Etats Unis d'Amérique' (Vol. V, Paris 1892). Consult also Gachot, 'Rochambeau' (in *Nouvelle Revue*, Paris 1902); Jusserand, J. A. A. J., 'Rochambeau in America' (Washington 1912); Lodge, Henry C., 'A Fighting Frigate and Other Essays' (New York 1902); 'Rochambeau' (published by the Joint Commission on Library of the United States Congress, Washington 1907); Soulé, Françoise, 'Histoire des troubles de l'Amérique anglaise' (Paris 1787); and the anonymous work, 'Journal des opérations du corps français sous le commandement du comte de Rochambeau,' sometimes attributed to Rochambeau.

ROCHDALE, roch'däl, a market-town and Parliament borough, England, in Lancashire, 10 miles north-northeast of Manchester. The parish church of Saint Chad, finely situated on a lofty height and approached from the lower part of the town by a flight of 122 steps, is a spacious and venerable structure of the 12th century (restored in 1837), partly in the late Norman and partly in the Perpendicular style, with a square embattled tower, several windows of rich tracery and some very ancient monuments. Rochdale is a place of considerable antiquity, and had a Roman station in its vicinity. Its woolen manufacture appears to have been introduced by the Flemings in the reign of Edward III, and having continued to flourish is mentioned as famous in the reign of Elizabeth. The Rochdale Co-operative Store, which has several branches in the town, was the first society of its kind, and has served as a model for other co-operative societies. There is a monument to John Bright, a native of Rochdale. Pop. 91,428. Consult 'Victoria History of the County of Lancaster' (8 vols., London 1906-14).

ROCHDALE PIONEERS, or ROCHDALE SOCIETY OF EQUITABLE PIONEERS. See CO-OPERATION.

ROCHE, rôch, Alexander, Scottish artist: b. Glasgow, 17 Aug. 1861. He began life as an architect, but turning his attention to painting, studied at Paris under Boulanger and Lefebvre. He has painted in landscapes and genre, and among his pictures are 'Tête-à-Tête,' which carried off a gold medal at Munich in 1889; 'Fishers' (1891), bought by the Berlin Gallery; 'Landscape,' awarded a gold medal at Dresden (1897); 'Prue' (1902), bought by the Munich Gallery; 'The Window Seat' (in Carnegie Institute, Pittsburgh); 'Spring'; 'Low Tide'; 'Old Song' (in Stuttgart Public Museum); 'Margaret' (in Scottish National Gallery, Edinburgh); 'Building of the Ship' (1905, in Dublin Gallery); 'Old Harbor' (1907); portraits of Mrs. Andrew Carnegie and daughter (1903) and Miss Flora Stevenson (in Edinburgh Gallery); 'The Prison Gate, Magadar' (1916). Roche was elected to the Royal Scotch Academy in 1900. He also painted the frescoes in the Banqueting Hall, Glasgow Municipal Building, 1900. He has published 'Finish in Art' ('Transactions' of the National Association for the Advancement of Art, 1889) and several essays and lectures on art subjects.

ROCHE, James Jeffrey, American author and editor: b. Mountmellick, Queen's County, Ireland, 31 May 1847; d. Berne, Switzerland, 3 April 1908. He was educated at Saint Dunstan's College, Charlottetown, Prince Edward Island. In 1883-90 he was assistant editor of the *Boston Pilot* and editor-in-chief 1890-1905. He was United States consul at Genoa, Italy, 1904-07 and at Berne 1907-08. He published 'Songs and Satires' (1886); 'The Story of the Filibusters' (1891); 'Her Majesty the King' (1898); 'By-ways of War'; 'Sorrow of Sap'ed' (1904), etc.

ROCHE, Regina Maria (Dalton), Irish novelist: b. south of Ireland about 1764; d. Waterford, 17 May 1845. She attained sudden fame in 1798 by the publication of her four-volume story, 'Children of the Abbey,' much in the fashion of the 'Mysteries of Udolpho,' which it rivaled in popularity. She then set to work on a long series of similar books—'The Nocturnal Visit' (1800); 'The Tradition of the Castle' (1824); 'The Nun's Picture' (1834), and a dozen others.

ROCHE, rôsh, Troilus de Mesgouat, MARQUIS DE LA, French colonizer in America: b. France, 16th century; d. Brittany, after 1600. In 1598 he received from Henry IV letters patent creating him lieutenant-general of Canada and adjacent islands, with power to establish colonies anywhere in North America. With a crew drawn largely from French prisoners, he set sail with one Chefdhotel of Normandy as pilot. After landing 40 of his force on Sable Island, he explored Acadia. Head winds prevented a landing at the island, on his return, and he sailed on for France, where he was impressed for a year. Chefdhotel was ordered to go in search of the 40 followers, who had fortunately made their escape by means of wrecked vessels found on the coast. Consult Champlain, Samuel, 'Voyages' (in Publications of the Prince Society, Vols. XI-XIII, Boston 1878-

82) and Parkman, Francis, 'France and England in North America' (Boston 1898).

ROCHE-SUR-YON, La, formerly Napoléon-Vendée and Bourbon-Vendée, a town in France, the capital of the department of Vendée, 40 miles south of Nantes, situated on a hill on the right bank of the Yon. The streets nearly all end in a spacious square, bordered with ranges of fine trees and surrounded by public monuments and elegant mansions. The parish church, with a peristyle of six Doric columns and the maire, or mansion-house, an elegant Italian building, are both in the square. There is an active trade in woolen cloth and hardware. Yon was founded by Napoleon I on the site of the ancient castle of Roche-sur-Yon, destroyed at the Revolution, and received the name of Napoléon-Vendée, which was changed to Bourbon-Vendée at the Restoration and to its present name on the dissolution of the Second Empire in 1870. It contains an equestrian statue of Napoleon I and a museum. Pop. 14,885.

ROCHEFORT, Henri, ôh-rê rôsh-fôr (VICTOR HENRI, MARQUIS DE ROCHEFORT-LUCAY), French journalist and politician: b. Paris, 30 Jan. 1830; d. 1 July 1913. He became known as the author of successful vaudevilles and farces and as a contributor to *Charivari*, *Figaro* and other Parisian periodicals, wherein his political reviews were marked by a brilliancy of wit and audacity of attack that brought upon him the resentment of the government. His assaults on Napoleon III led the emperor to demand his expulsion from the staff of *Figaro*. Rochefort thereupon (1868) founded a weekly of his own, *la Lanterne*, in which he continued his assaults on the government with unrivaled weapons of sarcasm and ridicule, beneath which the emperor and his ministers were helpless. The *Lanterne* attained an enormous circulation and when the editor was forced by repeated sentences of the courts to take refuge in Belgium, he continued its publication in a spirit all the more acrimonious. In 1869 he was elected to the Corps Législatif and established the *Marseillaise* with the professed object of combating the Second Empire. In January 1870 he was imprisoned for inciting to insurrection. After the fall of the empire he became a member of the government of national defense, but was out of sympathy with the conservative tendencies of that body and strongly inclined to the radical element that afterward brought forth the Commune. In May 1871 Rochefort fled from Paris, but was captured and sentenced by a court-martial to deportation. In 1873 he was transported to New Caledonia, but escaped in the following year, lived in Belgium and Switzerland and renewed the publication of the *Lanterne*. In 1880 he returned to Paris and founded the *Intransigeant*, a periodical of virulent protest. He was deputy in 1885-86, became an ardent supporter of Boulanger and in 1889 was sentenced to imprisonment, but escaped to England. He returned under amnesty in 1895 and attracted public attention as one of the most violent opponents of Captain Dreyfus (q.v.) in that celebrated affair. He published 'Les français de la décadence' (1866); 'La grande Bohème' (1867); 'Les petites mystères de l'Hôtel des Ventes' (1862); 'Les naufrageurs' (1876); 'L'Évade'

(1880); 'Les dépraves' (1882); Napoléon dernier' (1884); 'Les Aventures de ma Vie' (Paris 1896). Consult Macdonald, J. F., 'Personal Recollections of Rochefort' (in *Contemporary Review*, Vol. CIV, London 1913).

ROCHEFORT, or **ROCHEFORT-SUR-MER**, France, chief city of an arrondissement of the department of Charente-Inférieure. It is notable for its naval and army institutions and its well-built public works. It has two harbors—military and commercial. Napoleon purposed embarking for America from this point, but his plans were frustrated. The manufactures include tiles, beer, candles, artificial flowers, naval clothing. There are also various metal foundries, etc. Shipbuilding is also important. The wharves, magazines, dockyards, munition works, etc., are well planned and are now almost entirely modernized.

ROCHEFOUCAULD, rôsh-foo-kô, François, Duc de La. See LA ROCHEFOUCAULD.

ROCHEGROSE, Georges, zhôrh rôsh-grô, French painter: b. Versailles, 1859. He studied at Paris and developed under Lefebvre and Boulanger a powerful naturalistic style with an almost startling brilliancy of technique. His tendency to the brutal side of tragedy in his choice of subjects is, however, frequently revolting and his pictures too frequently swim in blood. Among the best known and most characteristic are 'The Death of Geta, Emperor of Rome,' and 'The Fall of Babylon.' Others of like nature are 'Vitellius'; 'Andromache'; 'La Jacquerie,' and 'Barbarian Ambassadors before Justinian.' Of another kind are his mural decorations of the Sorbonne, 'The Red Delight'; 'Knight among the Flowers'; illustrations for 'Salammbô,' and 'Herodias.' In 1892 he became an officer of the Legion of Honor.

ROCHEJACQUELEIN, rôsh-zhâk-lân, Henri de la. See LA ROCHEJACQUELEIN.

ROCHELLE, rô-shêl', Ill., city in Ogle County, on branches of the Chicago, Burlington and Quincy, the Chicago, Milwaukee and Saint Paul, and the Chicago and Northwestern railroads, about 70 miles west of Chicago and 150 miles north of Springfield. It is the commercial and trade centre of a fertile agricultural region, in which stock-raising is an important industry. The manufacturing interests are connected with farm products. It has a high school, public elementary schools and a public library. Pop. 2,732.

ROCHELLE, La, la rô-shêl, France, chief town of the department of Charente-Inférieure, a fine port and strongly fortified, 120 miles from Bordeaux. Rochelle played an important rôle in the Reformation period, resisting many assaults, but was finally forced by famine to succumb (1628). It has a fine town hall begun in 1486, an 18th century cathedral, exchange, courthouse and the "House of Henry II," a lycée, old episcopal palace now used as a library and picture gallery, teachers' training school, academy of fine arts, botanical gardens and a museum. Its manufactures include porcelain, textiles, sugar and glass. Pop. 36,371.

ROCHELLE SALT, sodium potassium tartrate, a white crystalline substance, discovered by Seignette, an apothecary of Rochelle,

France, in 1672. It has a mildly saline and slightly bitter taste, and is much used as a laxative, especially in seidlitz powders. Its formula is $\text{KNaC}_4\text{H}_4\text{O}_6 + 4\text{H}_2\text{O}$.

ROCHESTER, rôch-ês-têr, John Wilmot, 2d EARL OF, English poet and courtier: b. Ditchley, Oxfordshire, 10 April 1647; d. Woodstock Park, Oxfordshire, 26 July 1680. On his father's death in 1658 he succeeded to his titles and estates, the latter of which he soon dissipated. Having studied at Oxford, he served with credit in the fleet under Lord Sandwich at the attack on Dutch ships in the harbor of Bergen, but subsequently gave himself up to dissipation and became the personal friend and favorite of Charles II, who is said to have encouraged and shared many of his exploits. He frequently fell into disgrace at court, though his pardon was not long in forthcoming. His constitution at length gave way, and at 30 he was visited with all the debility of old age. He lingered for some time in this condition and died after sending for Bishop Burnet and professing great penitence for his misspent life. The volume of obscure verse purporting to be his contains much that is spurious. He was no better and rather worse than the lax writers of his day; but the edition of his poems brought out by his friends in 1691 contains such exquisite lyrics as entitle him to rank as the best song writer between Carew and Burns. He wrote the famous epigram on Charles II, asserting he "never said a foolish thing and never did a wise one." Consult Burnet, 'Some Passages in the Life and Death of John Wilmot, Earl of Rochester' (1680), and Longueville, Thomas, 'Rochester and Other Literary Rakes of the Court of Charles II' (New York 1903).

ROCHESTER, Nathaniel, American pioneer: b. Cope Parish, Westmoreland County, Va., 21 Feb. 1752; d. Rochester, N. Y., 17 May 1831. Having gone in 1763 to Granville County, N. C., he was made a member of the committee of safety for Orange County in 1775, in 1776 was a member of the first provincial convention in North Carolina and was appointed by the convention a deputy commissary-general of military and other stores. He soon afterward resigned and was elected to the North Carolina legislature. In 1783 he established various manufacturing enterprises at Hagerstown, Md., and in Maryland became a member of the assembly, judge of the County Court and a Presidential elector. Independently and in association with others, he purchased tracts of land in western New York, including (1802) one of 100 acres in Falls Town, now in the heart of Rochester. He removed (1810) to Livingston County, near Dansville, and (1815) to Bloomfield, Ontario County. In April 1818 he went to Falls Town, which had been named Rochester in his honor; and in 1821-22 was the first representative of Monroe County in the State legislature. Consult Rochester, Nathaniel, 'Early History of the Rochester Family in America' (Buffalo 1882).

ROCHESTER, England, in the county of Kent, a river port on the Medway, 26 miles southeast of London. Its ancient castle (11th century) on an eminence overlooking the river commands the view of a vast expanse of the surrounding country. The great tower of this ruined castle is one of the finest specimens of

Norman architecture extant. It was restored in 1900. The castle and grounds are the property of the municipality, and the latter have been made into a public garden. The cathedral, founded by Saint Augustine in 604, presents a mixed style, as it was destroyed by the Danes, and parts were added and remodeled subsequently at various epochs. There are many monuments of great antiquity. Of secular buildings, the town-hall, exchange, municipal buildings and almshouses, schools and Working Men's Institute are the most important. There is a large shipping trade, a steam-engine plant and other industrial establishments, and lucrative oyster fishing. The town was founded by Ethelbert. The castle was built by Henry III. Henry VIII visited Rochester, accompanied by Charles V, and Elizabeth spent five days there in 1573. Dickens introduces Rochester into 'Pickwick,' 'Edwin Drood' and others of his novels. The city is on the site of the ancient Durobrivæ. Pop. 31,384.

ROCHESTER, Ind., city and county-seat of Fulton County, on an outlet of Lake Manitou, 98 miles north of Indianapolis, on the Erie and the Lake Erie and Western railroads. The city was chartered in 1832 and is situated in a productive agricultural district. Industries include bridge works, canneries and manufactures of machinery. Pop. 3,364.

ROCHESTER, Minn., city and county-seat of Olmstead County, on the Zumbro River, and on the Chicago and Northwestern and the Chicago Great Western railroads, about 90 miles southeast of Saint Paul and 49 miles west of Winona. It was settled in 1854 by James Bucklin and Mr. Proudfoot, and incorporated as a city in 1858. Rochester was visited by a cyclone in 1883, which caused the death of 27 persons and the loss of a large amount of property. It is in a productive agricultural region, corn, barley, clover being among the principal crops. Considerable attention is given to stock-raising. The chief manufacturing establishments are flour and grist mills, a foundry, the Sears-Roebuck camera factory and machine shops. There are large grain elevators and stock yards. The principal buildings are the courthouse, municipal building, Masonic Temple, Odd Fellows' building, Metropolitan Theatre, Mayo Clinic, Colonial, Worrell and Stanley hospitals, Kahler Sanitarium, the Rochester State Hospital for the Insane, Saint Mary's Hospital, Zumbro Hotel, a number of churches and the convent of the Sisters of Saint Francis. The educational institutions are the high school, public and parish elementary schools, private commercial schools, Notre Dame de Lourdes Academy (R.C.), founded in 1877, and four libraries. The city is the home of the famous surgeons, Charles and William Mayo (q.v.), who founded the Mayo Clinic. The five banks have a combined capital of \$1,000,000; and the annual business amounts to nearly \$6,000,000. The city has constructed a million-dollar hydro-electric plant on the Zumbro River 14 miles north of the city. Seventy thousand persons annually visit Rochester for health. The government is vested in a mayor, alderman-at-large and a council of six members, three of whom are chosen by popular vote each year. Pop. 15,000.

ROCHESTER, N. H., city in Strafford County; on the Cocheco and Salmon Falls rivers, and on the Boston and Maine Railroad; about 30 miles east by north of Concord, and 35 miles northeast of Manchester. It was settled in 1722 by emigrants from England; incorporated as a town in 1722 and chartered as a city in 1891. It is the commercial and industrial centre of a large part of Strafford County; the chief manufacturing establishments are shoe factories, woolen mills, brick yards, box factories and other industries. The trade is chiefly in its own manufactures and in farm products. The principal public buildings are the Gaffney Home for the Aged, several churches and the schools. The educational institutions are a high school, public and parish schools, private commercial schools, and a public library. The government is vested in a mayor and a council of 18 members who hold office for three years, six being elected each year. Pop. 9,078. Consult McDuffee, 'History of the Town of Rochester' (Manchester, N. H., 1892).

ROCHESTER, N. Y., city and county-seat of Monroe County, is situated on Lake Ontario, the Genesee River and the Barge Canal. It is reached by the following railroads: New York Central and Hudson River, West Shore, Lehigh Valley, Erie, Buffalo, Rochester and Pittsburgh and the Pennsylvania. It has two car ferries to Coburg, Ontario, making round trips daily throughout the year; is an important coal shipping port and a point of call for passenger steamers in the Toronto, Kingston, Thousand Islands, Montreal and Quebec trade. It is 228 miles west of Albany. The city lies on a plateau 263 feet above Lake Ontario, is built on both sides of the river, and almost in the centre of the city are the Upper Falls of the Genesee. There are two falls within the city limits. Midway through Rochester runs the Genesee, which is spanned by 10 bridges within the city limits, the middle one of which, built of stone, is enclosed by stores on both sides, but the others, of iron construction on stone piers, are open, affording beautiful and diversified views of the river, particularly from Driving Park Avenue bridge, whence can be seen a winding gorge nearly 200 feet deep. The sides of this show several distinct geological strata revealing the gradual formation of the earth, the red Medina sandstone being plainly visible as it rises from the water's edge for more than half the height of the precipice, when it gives place to successive layers of green shale, limestone, hematite iron ore, green and purple shale, and finally a topmost crust of limestone, all belonging to the Upper Silurian Age. At the point referred to are the Lower Falls, about 80 feet high, a curtain of water most beautiful, though less imposing, than the principal cataract, two miles further back, in the centre of the city, from which, with its sheer descent of 96 feet, Sam Patch (q.v.) jumped to his death in 1829.

Barge Canal.—Crossing the city from east to west is the new Barge Canal which succeeds the Erie Canal constructed in 1825, and which for many years after its construction was the great highway of commerce through the State. The old canal crossed the river by means of an aqueduct of fine proportions, built of Lockport limestones at a cost of \$600,000. The canal at

ROCHESTER, N. Y.

1 The Falls of the Genesee, Upper Falls

2 The Falls of the Genesee, Lower Falls

this point is 506 feet above sea-level tide-water. The Barge Canal passes through the city about three miles to the south of the old canal and has a commodious harbor in conjunction with the Genesee River. The river is dammed for this purpose a little south of the Court Street Bridge.

Parks.—The Rochester park commission was created in 1888, since when work has been done so judiciously by the aid of the best landscape architects and nurserymen, taking advantage of the rolling lands that were obtainable, that few cities present so attractive an appearance in this regard. The total area of park territory is 1,649 acres, and the five largest parks, in their order, are Durand-Eastman, Genesee Valley, Seneca, Maplewood and Highland. Highland Park contains one of the finest arboretums in the country, and Durand-Eastman Park is located on Lake Ontario, and has the advantages of forest, field and stream.

Public Buildings.—There are four well-equipped hospitals, the General, Saint Mary's, Homœopathic and Hahnemann; a Municipal Hospital for contagious diseases, Iola Sanitarium for tubercular patients, Infants' Summer Hospital at Lake Ontario, the insane asylum or State Hospital, the County Hospital for free patients and a splendidly equipped dental dispensary, the gift of some of Rochester's public-spirited citizens. There are numerous hotels, many of them new and modern, of which the largest are the Powers, Rochester, Seneca, Whitcomb and the Osburn. Of late years, apartment houses have become popular and many have been built or are in process of construction. There are several theatres and motion picture houses, most prominent of which are the Lyceum, Temple, Family, Fay, Gayety, Piccadilly, Regent, Gordon and Rialto.

Newspapers.—There are several daily newspapers, the chief of which are *Democrat and Chronicle*, *Herald*, *Times-Union* and the *Post-Express*, and a large number appearing less frequently.

Clubs.—Of the social clubs the principal are the Genesee Valley, Rochester, Masonic, Whist, Elks, Physicians and University. There are three well-equipped country clubs, the Oak Hill, the Country and the Irondequoit; the first located near Genesee Valley Park, the second about two miles east of the city and the third still farther east. There is also a flourishing women's club, the Century. The Genesee Golf Club is located in Genesee Valley Park and has a large well-equipped clubhouse. The leading literary clubs are the Alembic, Pundit, Fortnightly and the Wednesday Morning.

Manufactures.—Rochester was built up by the milling industry. The quality and amount of wheat grown in the valley during the early days made a demand for flouring mills, which was strengthened by the presence of the high falls, so that those structures sprang up rapidly on both banks of the river and became so numerous that the place was long known as "the Flour City" and its pre-eminence in this respect was recognized throughout the country. The development of the enormous wheat-fields of the West caused a decline in this business, so that its relative position was taken by the nursery industry; this was started here in 1838,

after which it increased so that in 1904 there were more than 30 firms engaged in the business; besides the nurseries there are several large seedhouses, Rochester being the foremost city in the world in this regard. It is now called "the Flower City." The first trees sent to California went from here in 1849. Rochester is the home of the camera and is often called "the Kodak City." It leads the world in the manufacture of photographic goods and supplies, soda fountain fruits and syrups, enameled steel tanks, filing devices and office systems, thermometers, optical goods and check protectors. Because of the wide range of articles manufactured, it is known as "the City of Varied Industries" and has adopted as a slogan, "Rochester Made Means Quality," as practically all of the goods manufactured are of the highest grade. Sixty per cent of the carbon paper and typewriter ribbon made in the United States are manufactured in Rochester and the city leads the United States in the manufacture of high class ivory buttons. It is estimated that more than 350 separate commodities are manufactured in Rochester by 1,760 manufacturing establishments. Rochester is one of the largest shoe centres in the United States with 58 factories and an annual output valued at \$55,075,000. In the production of clothing, the output in 1918 was valued at \$24,000,000 in its 30 clothing factories. Canning of fruit and other foodstuffs is one of the large industries in the city. Although Rochester ranks twenty-fourth in the United States in point of population, it ranks first in the production of many manufactured articles. It is placed third in the production of clothing and has the same rating in the production of boots and shoes. Its total manufactures are valued at \$250,000,000. Receipts at the post office in 1918 were \$1,730,115.90. The capital invested in manufactures is estimated at \$150,000,000 and the total employees in factories is estimated at 125,000. The salaries and wages paid annually approximate \$50,000,000. The assessed valuation of property in the city in 1919 was \$286,455,240. The tax levy for 1919 is \$6,886,165, making a tax rate of \$24.065 per thousand.

Banking and Commerce.—A most important factor in the commercial and civic life is the Chamber of Commerce, organized in 1888, which now has a membership of 3,300. It is magnificently housed in its own building constructed especially for its use and all of which it occupies. There are 16 banks, including four savings banks, the capital and surplus of which, 1 Jan. 1918, was \$21,000,000 and the deposits \$208,000,000. The clearings for the last six months of 1918 were \$188,449,976.

Education.—The Rochester Athenæum and Mechanics Institute—generally known by the latter part of its title—was founded in 1885 as a free drawing school and has so expanded that it now gives instruction in practical arts and sciences to about 1,850 pupils and ranks fourth among the technical trade schools of the country. The University of Rochester, founded in 1850 and located in beautiful grounds in the eastern part of the city, has a faculty of 46 instructors, with 535 students, and a library of 76,800 volumes. There are also the Rochester Theological Seminary, of the Baptist denomination, founded in the same year, with a present faculty of 17, over 100 students and 42,900 books; Saint Ber-

nard's Theological Seminary, occupying capacious grounds north of the city, started in 1893, having now 13 professors, 225 students and over 15,000 volumes. The public school system, under the control of a board of education of seven members, is among the best in the country. It maintains 47 buildings with as many principals and during 1918 there were 1,250 teachers with 39,750 registered pupils. The expenditures of the board for 1918 were \$2,301,867.44. There are four high schools, East High, West High, Washington Junior High and Charlotte High. There are also 32 parochial schools and many private ones, including four academies, two of them for girls and two for boys, and one large institution for the instruction of deaf-mutes. The Rochester Public Library operates six branches comprising 75,000 volumes in all; also the Reynolds Public Library with 55,800 volumes, mainly books for reference and consultation.

Churches and Charities.—There are 155 churches in Rochester. The first congregation (Presbyterian) was formed in 1815; the Roman Catholic diocese of Rochester was created in 1868. Of the seven cemeteries the oldest is Mount Hope, opened in 1838, remarkable for its natural beauty, owing to the undulations of the ground in every direction. There are five orphan asylums, three of which are under Catholic control, one under Jewish. In 1822 the Female Charitable Society was organized, from which has risen the kindred institutions of to-day, including, besides the hospitals and asylums, the Industrial School, the Home for the Friendless, the Humane Society, the Children's Aid Society, the Society for the Organization of Charity and a host of other associations for relieving distress, the most of which are connected, more or less directly, with the various churches.

Public Service.—In 1873 the Holly system of waterworks was introduced for fire protection. In the same year pipes were laid to Hemlock Lake, 28 miles away, by which water that is unsurpassed, possibly unequaled in its purity by any other city in the United States, is obtained for drinking and other purposes; 39,500,000 gallons are delivered daily through conduits; there are within the city limits 452.5 miles of distributing mains, and 5,711 hydrants; the total cost of the works was \$12,926,907.19. The street cleaning is done by many water-carts, instead of by the unsanitary means of dust-raising brooms. It is probably owing, partly, to the agencies just described that Rochester is one of the healthiest cities of the Union, the annual death rate during five years averaging 14 to the 1,000. The police force consists of 407 uniformed men; the fire department has 402 men with 17 steamers, 23 hose carts, 10 truck companies and two water towers, and one protective volunteer company. The meteorological records of the 33 years show that the mean annual temperature was 47.3°, and the mean maximum 55.4°; the mean minimum 39.2°, the absolute maximum 99°; the absolute minimum 14° below zero; the mean annual precipitation 34.5 inches, the average number of clear days annually 83, partly cloudy 126, cloudy 156.

Rochester has always been free from overwhelming calamities. The worst two disasters, financially, in its history, in neither of which was a single life lost, were the great flood of 17

March 1865, when much of the city was under water for two days, doing a million dollars worth of damage; and the fire of 26 Feb. 1904, which devastated a large portion of the drygoods district and inflicted a loss of \$3,000,000. Rochester has a well-supplied electric street car system with 144 miles of track, besides interurban lines that run in every direction. There are two telephone systems in the city, one a home enterprise.

History.—In 1789 a sawmill and gristmill were built on the west bank of the river by Ebenezer Allan—commonly called "Indian Allan" from his lifelong association with the savages—who received, as compensation for the work, from Phelps and Gorham, the owners of the land, 100 acres surrounding those pioneer structures. Though no settlement was made at the time, that tract became the nucleus of the future city. In 1803 it was bought by Col. Nathaniel Rochester, Col. William Fitzhugh and Maj. Charles Carroll, all of Maryland, for \$17.50 per acre. Some scattered dwellings were built in the vicinity within the next few years, but no house was erected in what was then called Rochester, after the first-named proprietor, until 1812, when a log cabin was built on the spot that has ever since been known as the Four Corners. Other residences soon went up, in one of which the first white child was born 2 Dec. 1814. Settlers from the New England States came pouring in and when the first census was taken in December 1815, the population was shown to be 331. In 1817 it was incorporated as a village, under the name of Rochesterville, but in 1822 the title was changed to Rochester. In 1823 the size of the village was augmented by taking in a part of the town of Brighton, on the east side of the river, and subsequent additions have so increased the area that it now embraces over 20,900 acres, with 401 miles of open streets, 290 miles of which are improved, with 380.2 miles of sewers. It was incorporated as a city in 1834, the first mayor being Jonathan Child. Rochester was the birthplace of modern Spiritualism, the famous Fox sisters having given here, in 1849, the first manifestations of mysterious rappings, which speedily became known as the "Rochester knockings." During slavery times, Rochester was one of the centres of the abolition movement and one of the principal stations of the "underground railroad." It was the home of Frederick Douglass (q.v.), the celebrated negro orator, and was the place in which William H. Seward (q.v.) in 1858 uttered in a public address his memorable phrase in speaking of the struggle between freedom and slavery as an "irrepressible conflict between opposing and enduring forces."

The government is vested in a mayor and common council, elected for two years, under a charter of 1908. A comptroller, police justice, assessors, aldermen, school commissioners, etc., are chosen by the people. The city budget is about \$6,200,000 yearly.

Population.—In 1910 Rochester ranked 24 in the list of cities in the United States. The population in 1820 was 1,502; (1825) 5,273; (1834) 12,252; (1880) 89,363; (1890) 162,608; (1910) 218,149; (1915) 248,465. This shows an increase between 1890 and 1900 of 21 per cent and between 1900 and 1910 of 34 per cent. The population in 1919 is estimated at 270,000.

HOWARD STRONG,

Secretary, Rochester Chamber of Commerce.

ROCHESTER, Pa., borough in Beaver County, at the junction of the Ohio and Beaver rivers, and on the branches of the Pennsylvania Railroad, about 25 miles northwest of Pittsburgh. It is connected by electric lines with Beaver, Beaver Falls, New Brighton and other nearby places. A bridge across Beaver River connects the borough with Bridgewater, and one across the Ohio connects the town with Monaca. It is in the coal and oil region, and in the vicinity are deposits of fireclay and building-stone quarries. The chief manufactures are flour, lumber, brick, glassware, foundry products, mining tools, structural iron and oil-well supplies. The principal public buildings are the churches, schools and Masonic Temple. Pop. 5903.

ROCHESTER, University of. See UNIVERSITY OF ROCHESTER.

ROCHESTER PLAN OF EDUCATION. See RETARDATION OF PUPILS.

ROCHESTER THEOLOGICAL SEMINARY, founded at Rochester in 1850 by the New York Baptist Union for Ministerial Education. As early as 1847 an attempt was made to remove Madison (now Colgate) University from Hamilton to Rochester, but this was opposed by the Baptists of Hamilton and legal obstacles were found, so that the plan was abandoned. The University of Rochester (q.v.) was established at the same time by the Baptists, and for a time the two institutions occupied the same buildings, but there has never

been any organic connection between the university and the seminary, the latter being essentially a professional school. The regular course is three years; instruction is given in the departments of Hebrew language and literature (Old Testament), theology, church history, New Testament, homiletics and pastoral theology, elocution, English Bible and Christian ethics. Graduation from college or preparation in Greek sufficient for the study of the Greek Testament is required for admission; formerly there was an English course for those who had no classical training; this was abandoned in 1889-90. In 1852 a German department was organized; the course is literary as well as theological and covers six years. The seminary was at first without endowment, and at the end of 10 years had only \$75,000; in 1917 the productive funds amounted to \$1,814,000. The library is one of value, including the whole collection of Neander, the German church historian, and numbering 45,000 volumes. The total number of students was 152 in 1917.

ROCHET, a lawn or linen lace garment, somewhat like the surplice in shape, but with close-fitting sleeves or sleeveless, worn by bishops, abbots, prelates and other ecclesiastical dignitaries. Also a ceremonial robe formerly worn by British peers.

ROCHETTE, Désiré Raoul, dā-zē-rā rā-ool rō-shēt, French archæologist: b. Saint-Armand, France, 9 March 1790; d. Paris, France, 3 July 1854. He was educated at Bourges, removed to Paris in 1811, in 1815 became assistant professor to Guizot, whom he afterward succeeded in the chair of history at the Sorbonne. In 1826 he became professor of archæology at Paris, and in 1838 was elected permanent secretary of the Academy of Fine Arts. He gained a wide reputation for learning, was popular as a lecturer and enjoyed high favor after the Restoration. Besides his unfinished history of ancient art he wrote 'Antiquités du Bosphore Cimmerien' (1822); 'Tableau des Catacombes du Rome' (1837); 'Lettres archéologiques sur la Peinture des Grecs' (1840); 'Mémoire sur l'Acropole d'Athènes' (1845); 'Mémoires d'Archéologie comparée Asiatique, Grecque, et Etrusque' (incomplete, 1848), etc.

ROCK-BASS. See BASS.

ROCK-BRAKE. See FERNS AND FERN-ALLIES.

ROCK BREAKING. See GOLD MINING.

ROCK CLEAVAGE, a tendency that many rocks have to part more easily along certain parallel directions than in other directions. If this tendency was imparted to the rock at the time of formation it is called primary or original cleavage. Bedding is the usual type of primary cleavage. If the tendency is imparted after the rock has been formed it is called secondary or induced cleavage. Such cleavage is produced by pressure and is usually not parallel to the original bedding planes. If the tendency to part results from many closely spaced fractures it is called fracture cleavage. Frequently, however, there is no actual fracture, but the weakness comes from the arrangement of the mineral particles in parallel directions. This can often be plainly seen in schists which split parallel to the numerous mica plates. This latter type is called flow cleavage. It is well

exhibited in schists, gneisses and slates. It is believed to be caused by actual rock-flowage, under intense pressure. See **ROCK-FLOWAGE**; **METAMORPHISM**; **ROCKS**, **SCHIST STRUCTURAL GEOLOGY**, etc.

ROCK CRYSTAL. See **QUARTZ**.

ROCK DOVE, or **ROCK PIGEON**. See **PIGEON**.

ROCK DRILLS AND ROCK DRILLING. The steam or rock drill is known to-day as an American invention and its inception dates back to the excavation of the Hoosac Tunnel in Massachusetts. This enterprise was fathered during its period of construction by the State of Massachusetts and was beset with enormous difficulties. To begin the excavation of a tunnel five miles long through hard rock and to do the drilling by hand was an audacious proposition. Many methods of excavation were proposed and tried. Machines were built, tested and condemned. Among the inventors, the man who schemed the machine which in general features embodied the requirements of a perforator for making holes for blasting was Mr. Fowle of Boston. He constructed the first machine in which the drill used was made the extension of the piston rod of a reciprocating steam engine, which was moved forward toward the rock as the drilling advanced. The drill had a slow rotary as well as a reciprocating motion to ensure the boring of a round hole. With this beginning machines were improved in details, but operated without notable economy. The drills were heavy and could be used practically only when mounted on heavy carriages running on wheels on a track. They were much too heavy for mine or quarry work, although a few were used for such purposes.

Later came a demand for a lighter machine, and the Little Giant and Eclipse machines, both built by the Ingersoll-Rand Company of New York, were found useful. The Little Giant was operated by a positive motion valve and the Eclipse by a piston valve. With the introduction of light drills came various improvements which were found to be invaluable as the scope for the use of the rock drill enlarged. In fact, almost a new drill was made when the machines were applied on a large scale in New York City for outside excavation at a tunnel under 42d street and under Hell Gate, and also in the hard ore mines of Lake Superior.

As soon as the rock drill attained a reasonable state of perfection its improvement was immediately manifested to the world at large. It has often been called the advance agent of civilization, and it undoubtedly has a better claim to that title than any other mechanical invention of recent date. All modern engineering is dependent on its use, and problems which would be impracticable without this machine are rendered easy. Its influence on mining, quarrying, railroading and navigation has been felt all over the world. The rock drill has developed the mines and tunnels of the world. The work done by the rock drill may be said to be from 60 to 150 lineal feet of hole drilled per day of 10 hours in ordinary stone, including shifting and setting up of the drill, cleaning holes, etc. In tests and special cases the figures have been largely exceeded, sometimes as much as 400 lineal feet being made. Records of 24 inches

per minute are not uncommon, all, of course, for down holes in favorable rock, but 70 feet per day of 10 hours in granite, including moving and setting up, averages a fair working basis. The cost of drilling in this way may be stated to vary from 2½ to 13 cents per lineal foot, according to local conditions. From four to six cents per foot of hole drilled may be taken as the working figure for general calculations, and this includes all expenses. There are two distinct methods of machine drilling, one the auger drill, which bores the rock, and the other the percussion drill, such as the Little Giant or Eclipse, working by direct impact, that is, by striking repeatedly in the same spot and by simply bruising or chipping away the rock. Experience has proved that a reciprocating drill operates with the greatest economy and efficiency. The following are improvements made in the rock as used to-day:

Beginning with the cylinder of the drill, the method of using long bolts to hold the top and bottom heads in place with an elastic or spring buffer, whereby the blow (struck accidentally upon either head by the piston) is absorbed, may be placed first. The method of gripping the steel and the chuck by means of the "U" bolt and chuck key stands second. The device of flanged and rotating bar dropped through the ratchet box marked a great advance in the art. The use of the taper throttle was also a very neat device for preventing leakage and providing a graduated admission of the working fluid. In passing from the cylinder to its mounting the most important achievement was in the very simple device of mounting the drill on the horizontal arm attached to a vertical column, which in turn was mounted to a block and jacked in place by two screws, one on either end of the block. A kindred invention was the universal joint applied to the legs of a tripod.

Surface and Underground Work.—Surface work includes that class of excavation which occurs in open air, and underground operations include such borings as are underground. Surface drilling may be applied for opening up canals, for quarrying purposes, for opening up ways for railroads and similar undertakings. Such work may necessitate the use of tripod, column and shaft-bar, quarrying machines, channelers, gadders and the like. (See **QUARRYING**). Underground work necessitates the use of rock drills and compressed air machinery for purposes of sinking shafts, opening mines, etc. In shaft sinking and tunnel work, as in driving headings and enlarging, it has been found that the column is the best means of mounting rock drills. These columns are simply round, extra heavy, wrought steel tubes with a suitable claw-foot or rosette on one end and either one or two clamping or jack screws on the other. Stopping bars and tripods are also extensively used for special features.

Submarine Work.—Submarine or subaqueous rock excavation is essential for converting shallow rivers and harbors into navigable waterways. The conditions under which submarine rock excavation must be done are difficult to the last degree, calling for special apparatus of unusual strength and endurance. This character of work is nearly always carried on where tides, currents, winds and storms are present in a varying degree, and these elements

are practical obstacles to rapid and economical work. Add to these troubles deep water, irregular bottom covered over with mud, sand and other shifting material, which fills in almost as fast as removed, and the undertaking is seen to be extremely difficult. In the early days the usual method was to lower explosives to the surface of the rock and attempt fracturing by surface blasting. Later a form of drop bore was introduced. This system has been abandoned for the more progressive method of drilling a hole and inserting the charge of explosive as is done in rock excavation on land.

The removal of submarine rock is becoming a more important feature owing to the increasing depth of ocean and lake-going vessels demanding deeper channels for harbors and rivers. A barge, scow or float fitted with a suitable frame to support the drill guides, drill, boilers and other auxiliary apparatus, is usually employed in submarine excavation. The barge is towed into place and anchored by means of cables, anchor chains or spuds, or a combination of these methods, depending upon the rise and fall of the tide, or the currents to be encountered. The form of framework depends largely upon the system used to feed the drills down, as the hole is cut into the rock. The height of the frame and the length of feed depend on the rise of tide and the depth of water over the rock and the depth to which the hole is to be drilled.

Various styles of mountings are employed in submarine excavation work. The drills used for such operations are generally of the heaviest type, as the work to be done is always severe and difficult. See DRILL.

EDWARD F. SCHAEFER, M.M.E.,
Ingersoll-Rand Company, New York.

ROCK-EXCAVATING MACHINERY.

In quarrying the most important machines are the channeler, the gadder, rock drill, air compressor, etc. To meet the varying requirements of different classes of work four styles of track channelers are manufactured.

Upright Channeler.—This consists of a truck mounted on four flanged wheels running on a track. Upon this track is carried a boiler (in the steam driven machine) or a reheater (in the air driven channeler) together with a powerful chopping engine mounted at one side on a frame of great strength. At the end of the piston rod of this engine are connected cutting steels which are driven against the rock by steam or air power in the engine cylinder.

Swing-Back Track Channeler.—In machines of this type, the frame carrying the cutting engine swings on a hinge joint, giving an angular adjustment up to 45 degrees from the vertical in the bare machine, or 15 degrees in the outfit carrying the boiler or reheater. In addition to this movement the cutting engine swings in the plane of the frame, with an angular range up to 45 degrees either side of the vertical.

Undercutting Channelers.—These consist of a heavy frame of cast iron mounted on four wheels, carried on steel axles running in bab-bitted boxes. At either end of the frame is a special guide shell provided with a swinging adjustment in both horizontal and vertical planes, by means of which all angular condi-

tions may be met and cuts carried clear into the corners. The shells are hung very low, thus giving the least possible offset in cutting. The use of the two shells permits the channeler to work close to the wall and adapts the machine to deposits of any angle or dip.

The *bar channeler* consists of a carriage supporting the cutting engine mounted on two parallel bars along which it is moved automatically by means of an engine actuating a traveling feet nut. The engine is automatically reversed at each end of the travel; or the stops may be set at any intermediate point.

The *quarry bar* consists essentially of the single bar mounted on four tripod legs, two on either end. On the bar is mounted a carriage which supports the drill and which may be moved along the bar by means of ratchet and pinion and operated by a hand wheel.

The *gadder* consists of a heavy solid cast-iron body mounted on four wheels forming a truck running close to the floor of the quarry. To one end of the truck is hinged a standard or arm which can be swung from nearly horizontal to vertical and firmly locked in any desired position. On the swinging arm or standard is a sliding carriage on which may be mounted, by means of a cone pivot and bolt, any one of several sizes of rock drills, according to the work to be done. To raise or lower the drill and move it along the slide a chain is attached to the saddle and run up and over a shaft at the end of the swinging arm and down to a small drum on which it is wound by turning a crank conveniently placed for the operator. A special taper gib or wedge clamp is fitted on the saddle, wherewith the saddle is firmly locked to the swinging arm by simply throwing down a small lever when the drill has been raised or lowered to the proper position. At each corner of the truck frame is a large pointed steel pin or pointer, slipping freely in a guide socket, and when the machine is properly arranged a blow from a sledge on each of these pins anchors the trucks in place. See AIR COMPRESSOR; ROCK DRILLS; PUMPS, COMPRESSED AIR; PNEUMATIC TOOLS; MINING AND MILLING MACHINERY; COAL MINING MACHINERY; CRUSHING AND GRINDING MACHINERY; QUARRYING; ROCK DRILLS; TOOLS, ETC.

ROCK FALLS, Ill., city in Whiteside County, on Rock River and on the Hennepin Canal, the Chicago, Burlington and Quincy Railroad, across the river from Sterling, where connection is made with the Chicago and Northwestern Railroad, about 110 miles west of Chicago. It was settled in 1867 by Augustus P. Smith. It is the commercial and industrial centre of the eastern part of the county south of Rock River. The water power is good; the chief manufactures are wire fencing, rivets, bolts and nuts, box boards, agricultural implements, butter tubs, flour, furniture, woodenware, wagons, carriages, buggies, washing-machines, garden tools, display racks and dairy products. There are several churches, a high school, elementary schools and a public library. The banking resources amount to \$390,000; the value of taxable property to \$2,000,000, the annual tax levy to \$12,000, while receipts from the municipal electric-light plant amount to \$10,000. The government is on the commission plan. Pop. 3,000.

ROCK FEVER. See MALTA FEVER.

ROCK-FISH, the name of several fishes usually found about reefs and on rocky bottom. In the United States the most prominent one is the striped or rock bass (see BASS); another is a grouper (*Epinephelus adscensionis*) of the West Indies, called by English-speaking fishermen "rock-hind." The name applies on the Pacific Coast to the whole family *Scorpanida*, represented in the Atlantic by the dory or rose-fish (*Sebastes marinus*), which looks somewhat like a perch in form, reaches a length of two feet, has a rosy hue and is excellent for the table; it may be known by its nearly uniform orange-red color and its spiny head. The genus *Sebastes* contains more than 50 species of Pacific Coast rock-fish and several are constantly brought to market. Says Jordan: "*Sebastes pauci spinus*, the bocaccio, large and swift, is abundant in California. *Sebastes flavidus*, the yellow-tail rockfish, reaching a length of two feet, is one of the most valuable species. It is abundant from San Francisco to San Diego. *S. mystinus*, the black rockfish, is the most abundant species in rather shallow water about San Francisco. Another abundant species is the orange rockfish, *S. pinniger*, found from Puget Sound to San Diego. It reaches two feet in length and is a common market fish. The rasher (*S. miniatus*) is another important species, reaching a length of two feet and abundant from San Francisco to San Diego. The red rockfish (*S. ruberrimus*) is the largest species of all, reaching a length of two and one-half feet; it is abundant from San Diego to Puget Sound and is a valued food fish. Another important species is the yellow-backed rockfish (*S. maliger*), which is found from Monterey to Sitka. It is especially abundant northward and reaches nearly two feet in length. The Spanish flag, *Sebastes rubrivinctus*, banded red and white, is perhaps the handsomest sea fish in our waters." Consult Jordan and Evermann, "American Food and Game Fishes" (1902).

ROCK-FLOWAGE. It has been demonstrated that under sufficiently intense pressure, hard rocks can be made to flow. This has been accomplished in the laboratory. Cylinders of marble have been enclosed in hollow brass cylinders and subjected to intense compression slowly applied through a very long time. The brass cylinders were much distorted until they were only about half as long as before and much wider. The brass was then sawed away and the marble was found to have also taken the new shape, but to be as solid and unbroken as it was before. Marble not enclosed in the brass cylinders when subjected to the same pressure broke into little fragments. In the first case the rock flowed, in the second it fractured. Other rocks can be made to behave in the same manner. The pressure necessary to make the marble flow can easily be measured. It can then be figured how deeply rocks would have to be buried to undergo natural flowage due to pressure in the earth's crust. It has been variously estimated that at depths of from 5 to 12 miles the hardest rocks would flow. If so, that is the limit of depth of open cavities and of faults and veins. Below this depth is the zone of flowage; above it, where rocks fracture rather than flow, is the zone of frac-

ture. Flowage is in part due to the solution and recrystallization of minerals. New minerals are often formed with their longer dimensions at right angles to the force, producing flow cleavage. See ROCK CLEAVAGE, METAMORPHISM AND SECTIONAL STRUCTURE in article on GEOLOGY.

ROCK HILL, S. C., city in York County, in the northern part of the State, 80 miles north of Columbia, on the Southern Railroad. It is a live commercial and manufacturing centre and contains railroad shops, large hydro-electric plants, public library, Fennell Infirmary, the Winthrop Normal and Industrial College of South Carolina. The region is adapted to a large variety of farm and vegetable produce, specially to cattle-raising, hogs, sheep, poultry, etc. The city's industrial establishments include cotton mills, a bagging factory, knitting mills, automobile factory, fertilizer and oil mills, lumber and planing mills, flour and grist mills, foundries, ice and printing plants, etc. The city owns excellent water, light and sewerage plants. The commission manager form of government with three commissioners and a city manager is in operation. The three banks have combined capital and surplus of \$850,000 and deposits of over \$3,700,000, including two trust companies. There are five modern school buildings, including a well-equipped high school. There are 19 miles of paved sidewalks and asphalt streets. Pop. 15,000.

ROCK HIND. See ROCK-FISH.

ROCK-HOPPER, a rock wallaby or kangaroo (q.v.).

ROCK ISLAND, Ill., city, county-seat of Rock Island County, on the Mississippi River and on the Chicago, Rock Island and Pacific, the Chicago, Burlington and Quincy, Rock Island Southern and the Chicago, Milwaukee and Saint Paul railroads, 180 miles west by south of Chicago, opposite Davenport, Iowa, a few miles below Moline and 125 miles, in direct line, north by west of Springfield, the State capital. The city is named after the island in the river between the cities of Rock Island and Davenport. The United States government and the Chicago, Rock Island and Pacific Railroad built a combined railroad and highway bridge from Rock Island city to the island and thence to Davenport. The original cost of this bridge was \$1,000,000. Another bridge connects Moline with the island, thus making the three cities ("The Triplets") one in many matters commercial and industrial. Rock Island has steamer connections with all the Mississippi ports. The island is three miles long, composed largely of limestone. A government arsenal and armory are located here and represent an investment of about \$30,000,000. The grounds cover 1,000 acres. That portion of the river between the island and Davenport is navigable, but on the west side of the island the river has been dammed by the United States government, thus furnishing Rock Island, Moline, the island and Milan (a few miles below the city) with extensive water power, which has contributed to the development of a large and important manufacturing centre. Rock Island has excellent transportation facilities which make it of importance as a commercial city.

The chief industrial establishments are the arsenal in which there are normally 10,000 employees, plow and tractor factory, machine shop,

petroleum wax-plant, paint factory, oilcloth factory; brick, gas engine, lumber, stove works; soap, electrical appliance, storage battery and plumbing fixture works; sash and door and building materials factories, etc. The prominent public buildings are the government arsenal, the courthouse which cost \$175,000; the high school, \$125,000; the library, \$75,000; Saint Anthony's Hospital; the 20 churches and a number of fine business blocks. The Davenport mansion, on the island, is of historic interest. The educational institutions are Augustana College (Lutheran), opened in 1860; Vila de Chantal (Sisters of the Visitation), public and parish schools, several private schools, one city library and three school libraries. The five banks have a combined capital approaching \$1,000,000. The government is conducted on the commission plan.

Rock Island was settled in 1826 by Col. George Davenport. It was platted in 1835 and called Stephenson. In 1841 it was united with Farnhamesburgh under its present name, and in 1849 was chartered as a city. When Colonel Davenport built his home on the island in 1833 the neighboring places were a fort and an Indian trading post. Prior to his settling in this locality, in 1826, he had been there in 1816 with the government troops, when Fort Armstrong was established. Black Hawk, the Indian chief, often visited him here, and many of the people who are now regarded as 'history makers' often visited Davenport in his island home. During the Civil War the prison here was the place of detention of many Confederate prisoners. When the Mississippi Valley began to change from a raw producing region to a section sending to the world the finished and polished product of the best in manufacturing methods, Rock Island was among the leading cities which were quick to welcome the railroad and the manufactory, and the first to use the improved means presented to extend the commerce to the city. Pop. 27,961.

ROCK KANGAROO or **WALLABY**. See **KANGAROO**.

ROCK-MELON. See **MELONS**.

ROCK PTARMIGAN. See **PTARMIGAN**.

ROCK-RABBIT. See **HYRAX**.

ROCK RAPIDS, Iowa, city, county-seat of Lyon County, on the Rock River, and on the Illinois Central, the Chicago, Rock Island and Pacific and the Chicago, Saint Paul, Minneapolis and Omaha railroads about 70 miles north of Sioux City and 33 miles southeast of Sioux Falls, S. D. It is in an agricultural and stock-raising region. It has considerable manufacturing interests connected chiefly with farm and dairy products. It owns and operates the electric light, water and heating plants valued at \$150,000. It is the commercial centre for a large part of the county. Pop. 2,200.

ROCK RIVER rises in the State of Wisconsin, 50 miles west of Lake Michigan; it flows south-southwest, receives several tributaries, enters Illinois, and crossing the State in a southwesterly direction flows into the Mississippi a little below Rock Island. Its whole length is estimated at 330 miles, about 225 of which have been ascended by small steamers, though with some difficulty, owing to the various rapids. The region which it drains is one of

great fertility. It is connected with the Illinois River by the Mississippi Mineral Canal.

ROCK-ROSES. See **CISTUS**.

ROCK SALT. See **SALT**.

ROCK-SNAKE, an African python. See **PYTHON**.

ROCK-SOAP, a hydrated silicate of aluminum, containing peroxide of iron and water. It is a variety of halloysite, is found only massive, is earthy, easily broken, black or nearly so, very soft, somewhat greasy to the touch and adheres strongly to the tongue. Rock-soap is used for crayons, and is also useful, by reason of its saponaceous properties, in the washing of cloths, etc.

ROCK SPRINGS, Wyo., in Sweetwater County, on Bitter Creek, and on the Union Pacific Railroad, about 250 miles west of Laramie, and 170 miles east of Great Salt Lake. It is on a plateau, in a mountainous region in which there are extensive coal fields. The principal industries are connected with the mining and shipping of coal. There are banks and newspapers. The educational institutions are a public high school, public and parish elementary schools and a high school library. Pop. about 5,700.

ROCK TEMPLES. In many parts of western India, as at Ellora, Elephanta, Karli and Salsette Island, natural rocks have been cut into temples; as also into caves and forts. Out of India well-known instances of the same kind occur at Petra, in the Arabian Desert, at Abu-Simbed, in Egypt, and in China and Siam. Consult Ferguson, 'Rockcut Temples of India' (1889). See **CAVE-DWELLERS**.

ROCK-TROUT, a valuable fish (*Hexagrammus decagrammus*) of the coast of California and northward. It is one of the greenlings (q.v.), and is known northward as boregat and bodieron. It reaches a length of 18 inches, and is regarded as an excellent food-fish.

ROCK-WORK. See **MASONRY**.

ROCK-WREN, a grayish-brown migratory wren (*Salpinctes obsoletus*) of the Rocky Mountain region which haunts the mountain gulches and makes a big rough nest in some rift of rock, or on a ledge. It has a charming song, and is likely to come familiarly about the mountaineer's cabin.

ROCKALL ISLET, in the North Atlantic Ocean, 160 miles west of Saint Kilda, 260 miles north of Ireland and 290 miles west of the mainland of Scotland, is an isolated conical rock of stratified granite, 100 yards in circumference, rising 70 feet above the sea, from a sandbank about 50 miles long and 25 miles broad. The vicinity is a cod-fishing ground for Scotch and English fishermen. The first known landing was made in 1810, and the islet was the object of a scientific expedition in 1896.

ROCKEFELLER, John Davison, American capitalist: b. Richford, Tioga County, N. Y., 8 July 1839. After an education in the public schools of Cleveland, he there entered a mercantile establishment as clerk, and subsequently was made cashier and bookkeeper. In 1858 he became a member of the firm of Clark and Rockefeller, and in 1860 the concern entered the oil business as Andrews, Clark and Company. The firm, its style having been

changed to William Rockefeller and Company, built the Standard Oil Works at Cleveland in 1865, and in 1867 the various interests with which John and his brother William were connected were consolidated into one corporation. In 1870 the Standard Oil Company was incorporated, with John D. Rockefeller as president; and a capitalization of \$1,000,000. Thus at 31 he had already attained a commanding position in business, with ample resources. Then began that development and absorption which have been the wonder of the age and the subject of rare discussion, criticism and admiration. Gradually rivals in business were either taken into the Standard or driven out of the field. Within two years the Standard Oil Company's capital was \$2,500,000, and in 1874 was \$3,500,000. From that date the wealth of the company and of John D. Rockefeller grew by leaps and bounds and cannot be adequately figured. By 1881 it became necessary to better consolidate the enormous enterprises and the Standard Oil Company was made a trust under the guidance of the shrewdest lawyers of the country. It continued to make money so fast and to be so unpopular a monopoly that it was dissolved by the courts in 1892. By this time Mr. Rockefeller's wealth was variously estimated as between \$500,000,000 and \$1,000,000,000. He was the world's only billionaire. About 1900 Mr. Rockefeller began to turn his great business over more and more to his partners, and to take an interest in establishing and supporting charitable and useful works. His chief gifts have been to the University of Chicago, which has received from him about \$23,000,000; the General Education Board, \$50,000,000; the Rockefeller Foundation, \$100,325,000; Rockefeller Institute of Medical Research, \$4,000,000. He has given to a vast number of educational institutions, and the total is estimated, 1918, as about \$300,000,000. He presented also to Cleveland real estate and cash to the value of \$600,000; to Vassar College a \$100,000 building and 3,000 volumes on Greek art and literature; to Tarrytown, N. Y., \$50,000 for a high-service water tower; to the American Baptist Missionary Union, \$400,000; and to Barnard College, \$1,375,000.

ROCKEFELLER, John Davison, Jr., American capitalist, son of J. D. Rockefeller; b. Cleveland, Ohio, 29 Jan. 1874. In 1897 he was graduated at Brown University with the degree of A.B. Soon afterward he became associated with his father in business enterprises; was made a director of the Colorado Fuel and Iron Company, the Manhattan Railway Company, the Merchants Fire Assurance Corporation, etc. He is active in Sunday-school and philanthropic work; is chairman of the board of the Rockefeller Foundation; trustee of the Rockefeller Institute for Medical Research; director of the General Education Board, Bureau of Social Hygiene. Consult 'Report' of the Federal Industrial Relations Commission (Washington, D. C., 1915).

ROCKEFELLER, William, capitalist; b. Richford, N. Y., 31 May 1841. After schooling at Owego, N. Y., and Cleveland, Ohio, he became a bookkeeper and afterward a partner in a produce commission business. He became associated with his brother, John D. Rockefeller, when the latter became established in the oil

business and in 1865 William Rockefeller took the management and was at the head of the business in New York and was president of the Standard Oil Company of New Jersey and also of New York, until the trust was dissolved in 1911. He has been an official of a great number of corporations, among them the New York, New Haven and Hartford Railroad Company, being one of the 21 directors indicted in 1914, in which case the jury disagreed.

ROCKEFELLER, William Goodsell, capitalist, son of William Rockefeller; b. 1870. After graduation from Yale, in 1892, he was made treasurer of the Standard Oil Company of New York, and has been elected director in the Brooklyn Union Gas Company, the Lincoln National Bank, the Columbia Bank and other financial institutions.

ROCKEFELLER FOUNDATION. In March 1910 Mr. John D. Rockefeller set on foot a scheme to distribute a large amount of his wealth, for the avowed purpose of uplifting humanity all over the world, by organizing his philanthropic work through the United States government. At his request Senator Gallinger introduced a bill in the Senate creating the "Rockefeller Foundation," which, in the language of the bill, was "to promote the well-being and advance the civilization of the peoples of the United States and its territories and possessions, and of foreign lands, in the acquisition and dissemination of knowledge, in the prevention of suffering and in the promotion of any and all the elements of human progress." The bill failed to pass the United States Senate, and the State of New York granted a charter to the Rockefeller Foundation in 1913. Its endowment is \$101,324,576.78. The incorporators are John D. Rockefeller, John D. Rockefeller, Jr., Frederick T. Gates, Harry Pratt Judson, Simon Flexner, Starr J. Murphy, Jerome D. Greene, Wickliffe Rose and Charles O. Heydt. The officers are Chairman of the board of trustees, John D. Rockefeller, Jr.; president, George E. Vincent; secretary, Edwin R. Embree; treasurer, L. G. Myers; comptroller, Robert H. Kirk; assistant treasurer, L. M. Dashiell; members, Wallace Buttrick, Simon Flexner, Harry E. Fosdick, Frederick T. Gates, A. Burton Hepburn, Charles E. Hughes, Harry Pratt Judson, Starr J. Murphy, John D. Rockefeller, John D. Rockefeller, Jr., Wickliffe Rose, Julius Rosenwald, Martin A. Ryerson, Frederick Strauss, George E. Vincent. During the war the flood of gold poured out to relieve the suffering and the necessities of humanity covered pretty much the whole world. To the United War Work Fund went more than \$5,000,000, after large appropriations had been made to the seven individual agencies composing the united service; an equal amount having gone to those previously. Large sums went for medical research, the war work of the Rockefeller Institute, for war research, including the work of Dr. Alexis Carrel, for hygiene and for demonstrations. Great sums were appropriated for relief in the small countries devastated — Belgium, \$1,498,000; Armenia and Syria, \$610,000; Serbia, \$163,895. The American Red Cross received the immense contribution of \$8,083,772. The Foundation spent \$22,444,815 on war work from 1914 to 1919. Adverse criticism has been expressed at various

times in regard to the educational activities of the Foundation, it being alleged that its aim is to further entrench capitalism and to promote class education in the United States. Its religious activities have also been under suspicion.

ROCKEFELLER INSTITUTE FOR MEDICAL RESEARCH. This institution was incorporated 14 June 1901, with Dr. William H. Welch, of Baltimore, president; Dr. T. Mitchell Prudden, of New York; Dr. Christian A. Hester (since died in 1910); Dr. Theobald Smith, of Boston; Dr. Hermann M. Briggs, of New York; Dr. Simon Flexner and Dr. L. Emmet Holt, of New York (secretary and treasurer), for a board of scientific directors. Mr. Rockefeller pledged \$200,000 to the board to be drawn upon at their discretion during a period of 10 years, for preliminary work, his letter of gift expressing his desire "to accomplish the most for humanity and science." Scholarships and fellowships were created and distributed to the existing laboratories throughout the country, to enlist the co-operation of various investigators, to aid some promising lines of research which could not previously be continued for lack of funds, and to discover who and where were the persons who desired to undertake research work and what were their qualifications. At the end of the first year it was decided to centralize the most important lines of work in the Institute's own laboratory under a competent head and with special equipment. Mr. Rockefeller gave \$1,000,000 at the second annual meeting of the board in June 1902 for this object. The Schermerhorn property, fronting East River at East 66th and 67th streets, New York, was chosen for the site, and a plot comprising 26½ city lots, upon which the present building stands, was deeded to the Institute. Dr. Simon Flexner resigned his position as professor of pathology in the University of Pennsylvania to become director of the Institute and began his work 1 July 1903. The cornerstone of the building was laid 3 Dec. 1904, a building at the corner of Lexington avenue and 50th street being used temporarily.

The present organization provides for the following departments: Pathology, bacteriology, physiological and pathological chemistry, physiology, comparative zoology, pharmacology and experimental therapeutics.

The purpose of the Institute is research, not instruction; yet it exerts a considerable influence on medical education. Upon the basic sciences above mentioned the future discoveries on medical science must largely rest. The Institute endeavors to apply the latest discoveries in science to problems connected with the prevention and cure of disease.

The Institute has co-operated with the Health Department of New York in the study of conditions surrounding the production and distribution of the milk supply of the city, and the effects of milk upon the health of children in the tenements; also with the commission appointed by the city in 1904 to study the prevalence of the acute respiratory diseases, and with that appointed in 1905 to investigate cerebro-spinal meningitis. It has united with Harvard University in sending men to Manila to study certain phases of smallpox; and it has

made grants each year to assist important investigations which were being carried on in various places.

The work done by the Institute is published in various scientific journals and collected in volumes of 'Reprints.' In February 1905 the Institute took charge of the publication of *The Journal of Experimental Medicine*.

Mr. Rockefeller gave an additional \$3,820,000 when the hospital of the Institute was opened on 7 Oct. 1910. This made the income bearing endowment \$6,420,000, and the total endowment, including grounds and buildings, \$8,240,000. In the hospital the closest scientific study is given to obscure pathological conditions such as heart disease, pneumonia and infantile paralysis. The board of trustees of the Institute consists of John D. Rockefeller, Jr., Frederick T. Gates, William H. Welch, Starr J. Murphy and Simon Flexner.

ROCKEFELLER PLAN. See INDUSTRIAL PEACE, EXPERIMENTS IN.

ROCKET, the name of several plants. Rocket-salad, or properly *Roquette*, is a low-growing hardy annual (*Eruca sativa*) native to southern Europe. The young leaves are used by French and Italian cooks as a salad and pot-herb. They resemble radish in appearance, but horse-radish in flavor. Yellow rocket, upland or common winter cress (*Barbarea vulgaris*), also hails from southern Europe. It is a hardy biennial herb with yellow flowers for which it is grown in flower gardens. Its leaves are used for salads and pot-herbs. Sweet rocket, damask or dames violet (*Hesperis matronalis*), a tall, hardy perennial, is native to northern Asia and Europe. It has long been popular in old-fashioned flower gardens for its white or purplish flowers, which continue from June to August and are fragrant especially at night. The double forms are the best to grow.

ROCKETS. See PROJECTILES.

ROCKFORD, rŏk'fôrd, Ill., city, county-seat of Winnebago County, on the Rock River, and on the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, Chicago, Burlington and Quincy and the Illinois Central railroads, 81 miles northwest of Chicago. It was settled in 1834, being the first settlement in the county, and was incorporated as a city in 1853. In 1890 it obtained a considerable increase of territory by annexation, and now has an area of ten and one-half square miles. It is built on both sides of the river, which is here crossed by three railroad and four highway bridges. A dam 800 feet long across the river secures excellent water power for manufacturing, and the city is one of the most important industrial centres of northern Illinois. The chief manufactures are agricultural implements and furniture; others are pumps, watches, silver-plated ware, leather goods, sewing machines, clothing, knitting wool, paper, flour and grape sugar. There are about 600 manufacturing establishments, with over 20,000 employees and an annual production of \$25,000,000. The assessed valuation, which is one-third of the actual, was \$25,102,470 in 1918; while the city debt was \$477,100. The tax rate of \$.62 is equivalent to \$2.17 on the actual valuation. There are numerous banks, trust companies and newspapers. Rockford is surrounded by a fertile agricultural region, and with its railroad facil-

ties is an important shipping point for the products of this district. The city is well built with wide regular streets; among its notable public buildings are the Memorial Hall for Soldiers, the city hall, the courthouse, municipal tuberculosis sanitarium, three hospitals and the public library; the library contains over 80,000 volumes. The public school system is of the best, and includes a high school, organized in 1857; there is also a Roman Catholic parish school; and the city is the seat of Rockford College (for women) and of Brown's Rockford Business College. The government is vested in a mayor and council, elected biennially; the council has the power of appointing the city officers. There is an excellent water supply from five artesian wells, and the waterworks are owned and operated by the municipality. Pop. 75,000. Consult Church, C. A., 'History of Rockford and Winnebago County, Illinois' (1900).

ROCKFORD COLLEGE, a college for women, located at Rockford, Ill. It was founded in 1849 as a seminary and received its college charter in 1892. It has a collegiate department, department of music and preparatory department; the collegiate work is in two courses, classical and general scientific, for the completion of which the degrees of A.B. and B.S. are conferred. In 1917 the ground and buildings were valued at \$200,000; the productive funds amounted to \$242,152 and the annual income to \$101,305. In 1917 the students numbered 237 and the instructors 32.

ROCKHAMPTON, rōk'hāmp'ton, Australia, capital of the County of Livingstone, Queensland, on the Fitzroy River, about 325 miles northwest of Brisbane, almost on the Tropic of Capricorn. It is enclosed by hills and is the gateway to rich pasture lands and the adjacent Mount Morgan mineral fields. There are many fine buildings and a bridge 1,160 feet in length. It has considerable river traffic with the ports of Alma and Broadmount at the mouth of the river, 35 miles distant. The Queensland Central Railway has its terminus here. Pop. 20,915. North Rockhampton is a suburb and separate municipality with a population exceeding 3,000.

ROCKHILL, William Woodville, American diplomatist: b. Philadelphia, 1 April 1854; d. 1915. He was educated at the Lycée Bonaparte and the Collège de France, Paris, and was graduated from the military school of Saint Cyr in 1871. He served with a French regiment in Algeria but returned to the United States in 1876. In 1881 he returned to France and resumed his Oriental studies begun during his college course, and in 1884 entered the diplomatic service as second secretary of legation at Peking, China. He was *chargé d'affaires* at Seoul, Korea, 1887-88; visited China, Mongolia and Tibet during 1888-92 on exploring tours; was appointed chief clerk of the State Department in 1893; was made third Assistant Secretary of State a year later, and first assistant in 1896. He was Minister to Greece, Rumania and Servia, 1897-99, and the following year went as United States commissioner to China, where in 1901, under appointment as special ambassador, he signed the final peace negotiations. In October 1901 he resumed his duties as director of the Bureau of American Repub-

lics, to which he was appointed in 1890. He was Minister to China in 1905, Ambassador to Russia in 1909 and Ambassador to Turkey from 1911 to 1913. In 1915 he was sent on a mission to China, but died on the way at Honolulu. He has published 'Udanavarga, the Northern Buddhist' (1883); 'A Life of Buddha and the Early History of His Church' (1884); 'Land of the Lamas' (1891); 'Diary of a Journey in Mongolia and Thibet' (1893); 'Treaties and Conventions with China and Korea' (1904).

ROCKING STONES, boulders that are very insecurely balanced on their foundation. They are also known as perched or balanced boulders. Sometimes they result from the weathering away of the surrounding rock, leaving the boulder as a residual. More often they are carried in glacial ice and left in unstable positions as the ice melts.

ROCKINGHAM, rōk'ing-am, Charles Watson-Wentworth, MARQUIS OF, English statesman: b. 13 May 1730; d. 1 July 1782. He was educated at Westminster School and Saint John's College, Cambridge, and in 1750 was created an Irish peer under the titles of Baron and Earl of Malton, later in the same year becoming also an English peer and Marquis of Rockingham by succession. He took his seat in the House of Lords in the following year and continued in practice with his Whig sympathies which he had inherited from his father. He took little part in politics, being a hesitating speaker and of mediocre talent, until 1765 when on the refusal of Pitt to take office, he became Prime Minister. His large wealth and powerful family position contributed to his elevation, and he had the invaluable assistance of his brilliant secretary, Edmund Burke. He took a friendly attitude toward the American colonies and favored the repeal of the Stamp Act, though he affirmed the right of Parliament to tax the colonies. He gave offense to the king for his support of the repeal principle and for refusal of allowances of the king's brothers and was superseded by Pitt, who returned to form a new ministry. His tenure lasted barely a year and his Parliamentary career was inconspicuous until March 1782 when, upon the fall of North's administration, he was called upon to form a coalition ministry in which he held the treasury. The chief events of his second term were the concession of legislative independence to Ireland and the forcing the king to treat for peace with the United States on the basis of their independence. In accomplishing these ends credit is not given to Rockingham for exceptional force and brilliancy but rather for quiet tact and the adoption of a policy of opportunism. Consult Albemarle, 'Memoirs of Rockingham' (1852-53); Walpole, 'Memoirs of George III' (1894).

ROCKINGHAM, Vt., village and township in Windham County. The village is on the Rutland Railroad, 75 miles south of Montpelier. The township contains in addition to the village of the same name the villages of Bellows Falls, Saxton's River, Cambridgeport, and Bartonville. The district is chiefly agricultural, but there are paper mills and machine shops. The village is the seat of an academy. Pop. township 6,207.

ROCKLAND, Me., city and county-seat of Knox County; set off from Thomaston in 1848

and incorporated a city in 1854. On a harbor which is an easterly extension of Penobscot Bay at its mouth; is very commodious and easily accessible; is protected by a breakwater costing \$500,000 and two lighthouses. Rockland is connected with Maine Central Railroad system; 86 miles by rail from Portland; has steamboat connection with Boston, Bangor, Portland, etc. It has a complete electric railway system with 21 miles of track extending northward to Rockport and Camden, and westward to Thomaston and Warren and other electric railways. The region thus connected accommodates many summer tourists. Shipbuilding is an important industry. The *Red Jacket*, a clipper ship built at Rockland in 1853, is said to have made the passage across the Atlantic Ocean in a shorter time than it was ever made by any other sailing vessel. There are considerable deposits of lime and large lime and cement works have been established. The granite business is important. Two of the largest granite companies of the country have quarries in the vicinity, on the islands and on the mainland. These companies have handled some of the largest stone that have ever been wrought. The United States custom house in Saint Louis, the post offices in New York and Cincinnati, and many of the largest and handsomest buildings in the country have been built of Rockland granite. Steam and gasoline engines and blacksmiths' and granite workers' tools are manufactured. Fishing is carried on to some extent. Clams and sardines are canned, and more than 2,000,000 pounds of lobsters are shipped annually by rail. The public buildings are the United States custom house and post-office building, which is a handsome granite structure and cost about \$150,000, and the county courthouse and jail, costing over \$100,000. There is a fine soldiers' monument, a public library; banking facilities and newspapers. There are many handsome residences with fine grounds. Pop. 8,174.

ROCKLAND, Mass., town in Plymouth County, on the New York, New Haven and Hartford Railway, about 17 miles south by east of Boston. Until its incorporation as a separate town in 1874 it was a part of the town of Abington of the old Plymouth Colony. The town is pleasantly situated and its proximity to Boston and the convenience of transportation give it an excellent trade and have made it a popular suburb of that city. Rockland is a manufacturing place, with about 100 factories, distributing about \$750,000 annually in wages. The industry first in importance was the manufacture of boots and shoes. Tacks are also extensively manufactured, and other factories produce heels and shoe-findings, box board, shoe-boxes and soaps. Rockland has well-built factory and public buildings, churches, schools and attractive homes. It has two banks, a public library and weekly newspapers. Pop. about 7,100.

ROCKLAND LAKE, N. Y., a village of Rockland County, on the West Shore Railway and on the Hudson River, four miles north of Nyack and 30 miles north of New York. It has only a small permanent population but is a popular summer resort. Near here is Rockland Lake, a large sheet of clear, fresh water, from which 300,000 tons of ice are taken annually for use in New York.

ROCKLING, a European fish of the cod family and of the genus *Motella*, also classified as the *gaidropsaurus*, three species of which are regarded as valuable in British markets. They are of small size, with small scales, long body and one anal and two dorsal fins. Called also gade, whistlefish, sea-loach and celpout.

ROCKPORT, rok'port, Ind., city, county-seat of Spencer County, on the Ohio River on a branch of the Southern Railway about 32 miles east of Evansville. It has steamer connections with all the river ports. It is on a bluff about 100 feet above high water. It is in an agricultural region in which grain and tobacco are the chief productions. The principal industrial establishments are flour and grist mills, foundry, machine shops, tobacco stemmeries, brick works, silo works, basket factories, creamery, wagon and carriage works and furniture factories. It has a library founded in 1855. Pop. about 2,750.

ROCKPORT, Mass., town in Essex County, on the Atlantic Ocean and on the Boston and Maine Railroad, about 30 miles northeast of Boston. It is on an island, the same on which Gloucester (q.v.) is located, and includes Cape Ann, the most easterly point in Massachusetts. The town embraces several villages. Electric lines connect Rockport and Gloucester and many points on the island. It was settled in 1690 by Richard Tarr and was known at first by the name "Sandy Bay." It is a famous summer resort; near Pigeon Cove, one of the villages, are a number of summer cottages. Part of the land is fertile and is used mainly for market gardening. Some of the places of interest in the vicinity are Dogtown Commons, where in the last of the 18th century a hundred families exiled themselves and lived in loneliness and poverty on those bowlder strewn hills. Their numerous dogs gave the place its name. Other places of interest are Doctor's Run, The Headlands and the Straitsmouth Life Saving Station at Gap Cove. In the northeastern part of the town are extensive granite quarries. The chief manufacturing establishment is an isinglass factory which employs about 1,000 persons. There are one national and one savings bank. There are 12 churches, and the educational institutions are a high school, grammar and primary schools and a public library, opened in 1871. Pop. about 4,400, of whom 3,250 are in the village.

ROCKPORT, Tex., town, county-seat of Aransas County, on the Aransas Bay, an inlet of the Gulf of Mexico, and on the San Antonio and Aransas Pass Railroad, about 180 miles southwest of Galveston and 150 miles south by east of San Antonio. It was settled in 1865 by Doughty and Mathis; was incorporated in 1865 and chartered as a city in 1871. It has steamer connections with all of the Gulf ports. It is on the peninsula, Live Oak Point and is a popular summer resort. It has fishing interests, especially oysters, and small game is plentiful in the vicinity. Shipments are made of livestock and fruit. There are five churches, a high school, elementary schools and one national bank. The government is vested in a mayor and a board of aldermen, eight in number, who are elected biennially. Pop. about 1,400.

ROCKS. Regarded as a whole, the earth, so far as we can examine it first hand and thus

know it intimately, consists of three envelopes: (1) an outer gaseous envelope called the atmosphere; (2) a middle aqueous envelope called the hydrosphere; (3) an inner solid envelope called the lithosphere. These envelopes, considered together, including the lithosphere to a depth of some 10 miles below the sea-level, have been shown to consist quantitatively of the following elementary substances:

Oxygen.....	47.07	Potassium.....	2.45
Silicon.....	28.06	Sodium.....	2.43
Aluminum.....	7.90	Magnesium.....	2.40
Iron.....	4.43		
Calcium.....	3.44	Total.....	98.18

All the remaining elements together make up less than 2 per cent of the earth.

The above-named elements rarely occur in the uncombined state in the lithosphere, but are usually united chemically in different proportions to form those more or less definite chemical compounds called minerals (for example, quartz, SiO_2 ; calcite, $\text{CaO} \cdot \text{CO}_2$; olivine $(\text{MgFe})_2\text{SiO}_4$; and minerals in turn are aggregated in various ways to form rocks. A rock may be defined as any accumulation or aggregation of one or more mineral species or substances, which constitutes a considerable component of the lithosphere; for example, granite, sandstone, limestone, clay, gravel, salt-beds. Although the crust of the earth or lithosphere has been shown to contain many hundreds of species of minerals, nevertheless the great bulk of it is composed of comparatively few species, and these have been termed the rock-forming minerals, in contradistinction to the great multitude of mineral species found more particularly in veins, and which, though of great importance, economically, and of primary interest, scientifically, are insignificant in amount when compared with the great mass of the more common minerals which go to make up a large portion of the earth. Thus gold, silver, platinum, the sulphide ores and the minerals containing such rare substances as thorium, uranium or radium, are negligible in quantity when compared with the mass of minerals composing the lithosphere.

The science of rocks, in its broadest scope, which considers them in all their relations, is called petrology or lithology, while the systematic and descriptive science of rocks, leading more particularly to their nomenclature, is called petrography. This distinction is implied in the etymology of the words. The latter term is used commonly in connection with the microscopic study of the igneous rocks.

Those minerals which are of especial importance as rock-formers can be grouped as follows:

GROUP I.

Quartz.—This group, for present purposes, may be limited to a single species, quartz, which is one of the most abundant of minerals, and is remarkable otherwise for its rather superior hardness and lack of cleavage. It is the most indestructible of all the common rock-making minerals. It has strong crystallizing powers and, where allowed to grow intact, forms those beautiful hexagonal crystals with which all are familiar. Chemically it is an oxide of silicon, SiO_2 , that most abundant of all acid radicals, which, when combined with the bases alumina, lime, iron, magnesia and the alkalis, soda and

potash, in different ways, forms that most important of all classes of mineral substances, the silicates.

GROUP II.

Feldspars.—These are the most abundant of all rock-formers. They comprise a rather complex group of silicates, where alumina, the alkalis, potash and soda, and the alkaline earth, lime, are the bases. On a chemical and crystallographic basis they fall naturally into two series, the orthoclase and the plagioclase. Orthoclase is the type-species of the series. It is a silicate of potash and alumina having the chemical composition KAlSi_3O_8 , and is otherwise known as potash feldspar. It belongs to the monoclinic system of crystallization. A part of the potash of orthoclase may be replaced by soda. In fact most of the analyses of the mineral show only 1 per cent or more of the substance. This replacement of potash by soda can take place until these two constituents are present in nearly equal proportions without altering the monoclinic character of the species. Such an orthoclase is called soda-orthoclase.

Microcline, like soda-orthoclase, contains both potash and soda $(\text{K}, \text{Na})\text{AlSi}_3\text{O}_8$. It is, however, triclinic, but only slightly so. As it possesses a notable amount of potash, it may be classified with soda-orthoclase as representing the transition varieties of feldspar, lying between the monoclinic, potash, orthoclase series and the triclinic, soda-lime, plagioclase series.

The more typical plagioclases are represented by albite, oligoclase, andesine, labradorite, bytownite and anorthite, which together constitute the albite-anorthite series. The theory of their constitution was propounded by Tschermak in 1864. He showed that the series can best be explained as a mixture of two extreme molecules, the one a pure soda-alumina silicate molecule, and the other a lime-alumina silicate molecule, found in anorthite. The intermediate varieties can be considered as varying mixtures of these two molecules.

The feldspars are not only of primary importance as rock-formers, but the classification of rocks as at present accepted (more particularly the igneous varieties) depends largely upon the kind of feldspar which they contain.

The feldspars can be grouped in tabular form thus:

(a) Monoclinic	
Orthoclase (sanidine)	KAlSi_3O_8
Soda-orthoclase	$(\text{Na}, \text{K})\text{AlSi}_3\text{O}_8$
(b) Triclinic	
Microcline	$(\text{K}, \text{Na})\text{AlSi}_3\text{O}_8$
Soda-microcline	$(\text{Na}, \text{K})\text{AlSi}_3\text{O}_8$
Albite	$\text{NaAlSi}_3\text{O}_8$
Oligoclase	} Mixture of albite and anorthite
Andesine	
Labradorite	
Bytownite	
Anorthite	$\text{CaAl}_2\text{Si}_2\text{O}_8$

GROUP III.

Feldspathoids.—The minerals of this group are called feldspathoids or feldspar-like minerals, more particularly because of their chemical resemblance to the feldspars. There are but two species which need be considered here: leucite, which has a chemical composition expressed by the formula $\text{KAl}(\text{SiO}_3)_2$; and nephelite, having the composition $\text{K}_2\text{Na}_2\text{Al}_2\text{Si}_4\text{O}_{16}$. Chemically leucite resembles

orthoclase feldspar. In addition to being chemically like orthoclase, leucite, like its counterpart, alters to kaolin. But more interesting still is the fact that on decomposition it has been known to furnish orthoclase or orthoclase and muscovite.

Nephelite, as its chemical composition indicates, is analogous to the plagioclase feldspars. It is hexagonal in character. The decomposition of nephelite, like that of the plagioclases, usually results in the formation of some one of the zeolites, or more rarely it forms kaolin.

The feldspathoids are lower in silica than their corresponding feldspars, and it is believed that, where they are present, true feldspars would have formed, except for this deficiency in silica. They hold an important place in the classification of rocks.

GROUP IV.

Mica.—Two species here are of widespread occurrence; one is muscovite, the white, silvery, potash variety, having a chemical composition corresponding to $H_2KA_2(SiO_3)_2$. Chemically it is closely allied to orthoclase, and frequently results as an alteration product of that mineral. The second species, biotite, is dark-colored, owing to comparatively high percentages of iron. It also contains varying amounts of magnesia, and might thus be properly classed with the following group of minerals. It has the chemical composition $(HK)_2(MgFe)_2(AlFe)_2(SiO_3)_4$.

GROUP V.

The Ferromagnesian Minerals.—The minerals of this group take their name from the fact that they contain iron and magnesia as two of their prominent constituents. In addition they may contain lime and alumina in considerable amounts, also some alkali. The more important members of the group are included under the amphiboles and the pyroxenes, two species having numerous varieties. They form two parallel series which are both chemically and crystallographically analogous. Their relationship can best be shown by the following table:

Amphibole	
(a) Orthorhombic	
Anthophyllite	$MgSiO_3$
(b) Monoclinic	
Tremolite	$CaMg_2(SiO_3)_4$
Actinolite	$Ca(MgFe)_2(SiO_3)_4$
Hornblende	$Ca(MgFe)_2(SiO_3)_4$
Glaucophane	$CaMg_2Al_2(SiO_3)_4$
(c) Triclinic	$NaAl(SiO_3)_2, MgSiO_3$
Basgmatite	$Na_4Fe_2AlFe(Si,Ti)_8O_{22}$
Pyroxene	
(a) Orthorhombic	
Enstatite	$MgSiO_3$
Hypersthene	$(Mg,Fe)SiO_3$
(b) Monoclinic	
Diopside	$MgCa(SiO_3)_2$
Augite	$CaMg(SiO_3)_2$
Acmite	$MgAl_2SiO_5$
(c) Triclinic	$NaFe(SiO_3)_2$
Rhodnite	$MnSiO_3$

The really important rock-forming amphiboles and pyroxenes are to be found among the orthorhombic and monoclinic varieties. And it is necessary to distinguish here between those which are aluminous and those which are non-aluminous, for the special reason that the former on alteration produce chlorite, while the latter produce serpentine.

One other important rock-former must be mentioned as belonging to this group—olivine, so called on account of its usual olive-green color. It has the chemical composition $(Mg,Fe)_2SiO_4$, is orthorhombic in crystallization, and readily decomposes to serpentine.

GROUP VI.

Ores.—Minerals of this group that constitutes important rock-formers usually have iron as their principal constituent, and frequently constitute ores of that substance. Included here are:

Magnetite	$FeFe_2O_4$
Pyrite	FeS_2
Hematite	Fe_2O_3
Ilmenite	$FeTiO_3$
Chromite	$FeCrO_4$

Thus far the mineral species enumerated are mostly found as the essential constituents of that class of rocks hereafter to be described as igneous.

GROUP VII.

Accessory Minerals.—Those minerals which are usually of subordinate importance, and which are, therefore, more in the nature of accessory than notable rock-constituents, are included here:

Cassiterite	SnO_2
Rutile	TiO_2
Titanite	$CaTiSiO_5$
Apatite	$Ca_5(CaP)(PO_4)_3$
Monazite	$(Ce,La,Di)PO_4$
Corundum	Al_2O_3
Spinel	$MgAl_2O_4$
Garnet {	$Fe_2Al_2(SiO_3)_4$
Almandine	$Ca_2Al_2(SiO_3)_4$
Grossular	$Fe(AlO)_2(AlOH)(SiO_3)_2$
Staurolite	$Al(AlO)_2SiO_4$
Chiasolite	Al_2SiO_5
Kyanite	Al_2SiO_5
Fibrolite	$(Mg,Fe)_2Al_2Si_2O_{10}$
Cordierite	$(Na,Mg,Al)_2(AlFe)_2(BOH)_2Si_2O_{10}$
Tourmaline	$(AlFe)_2SiO_4$
Topaz	CaF_2
Fluorite	$ZrSiO_4$
Zircon	$(CaFe)_2(AlCaFe)_2AlOH(SiO_3)_2$
Allanite	$Ca_2Al_2(AlOH)(SiO_3)_2$
Zoisite	

Some of the above minerals occasionally come to be of considerable importance, or may even constitute the bulk of the rock-mass. As a rule, however, they are of minor consideration and frequently even negligible.

GROUP VIII.

Secondary Minerals.—Minerals of this class have originated as the result of the decomposition or alteration of some previously existing primary or original mineral. The most noteworthy are:

Kaolin	$H_2Al_2Si_2O_5$
Serpentine	$H_2Mg_2Si_2O_5$
Talc	$H_2Mg_3(SiO_3)_4$
Chlorite	$H_2(Mg,Fe)_2Al_2Si_2O_{10}$
Epidote	$Ca_2Al_2(AlOH)(SiO_3)_2$
	$Ca_2Fe_2(FeOH)(SiO_3)_2$

Kaolin results from the decomposition of orthoclase and other feldspars by the loss of some of the silica and alkalis, and by the addition of water (hydration). Serpentine results from the alteration of olivine and the non-aluminous hornblendes and pyroxenes by the loss of some of the magnesia and by an addition of water. Talc is formed by the hydration and partial decomposition of several of the lime-magnesia or non-aluminous ferromagne-

sian minerals, namely, tremolite, pyroxene (chiefly enstatite), phlogopite mica. Chlorite results most frequently from the alteration of the aluminous hornblendes and pyroxenes. Epidote also results from the alteration of the aluminous varieties of hornblende and pyroxene, especially those having some lime in their composition.

GROUP IX.

Precipitations from Aqueous Solutions.—

The following minerals occasionally form important bodies of rock. They are usually deposited from solution in water:

Salt	NaCl
Gypsum	$\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
Aragonite or Calcite	CaCO_3
Hydrous Silica	$\text{SiO}_2 \cdot n\text{H}_2\text{O}$
(Geyserite or Silicious Sinter)	

Origin of Rocks.—Two alternative hypotheses are at present recognized as possible explanations of the origin of the earth: (1) the old so-called nebular hypothesis, propounded by Kant and Swedenborg and later elaborated by Laplace and others; (2) the newly proposed accretion theory or planetesimal hypothesis propounded by Prof. Thomas C. Chamberlin of the University of Chicago. The first of these supposes that the earth was originally in a gaseous condition, from which, under its own gravity and by a radiation of its heat, it passed into a fluid state and thence to a solid form. The "original crust" of the earth (lithosphere) formed at the surface as the result of a cooling of the molten materials of the globe. Furthermore, the earth may have solidified from the centre outward as the result of pressure. Others suppose that the original crust was not only added to from below by the crystallization of molten material, but also increased in thickness from above by chemical precipitations from the intensely heated hydrosphere. The accretion theory, on the other hand, supposes that the earth as a whole never was in a gaseous or even fluid condition, but was built up by the infalling of cold, solid particles of matter called planetesimals; that the present internal heat is the result of pressure due to gravity. Adherents of both these hypotheses agree, however, that the oldest known rocks, the original or primitive rocks from which all others have been derived, are of igneous origin, that is, were once in a molten condition, from which they cooled to the solid state, and in so doing formed more or less thoroughly crystalline aggregates of different kinds of minerals.

In discussing the origin and descent of rocks we must, therefore, start with the more common igneous varieties, and show how they have furnished materials for the others.

Rocks may be classified as (1) igneous, (2) sedimentary and (3) metamorphic.

IGNEOUS ROCKS.

(Definitions depending upon external form and mode of occurrence.) Igneous rocks comprise all those portions of the lithosphere which are or were in an intensely heated and more or less fluid condition and which have subsequently solidified by cooling into massive, more or less crystalline bodies of varying sizes and shapes. They occur as intrusions into or replacements of some previously existing rocks of the lithosphere, either sedimentary, meta-

morphic or igneous. Where a huge mass of molten material slowly melts its way from some deep-seated portion of the earth up into the overlying rocks by dissolving them and incorporating them in its own mass, and subsequently cools there, slowly, without ever reaching the surface, forming a great irregular body of coarsely crystalline matter frequently scores of miles in extent, we have what is termed a batholith. In its molten condition it would be termed a magma and the reservoir in which it was contained would be called a magma basin. It might have extending from it (usually upward) irregular, more or less elongated, arm-like processes called apophyses. Should cracks or fissures form, they would be instantly filled by the inrush of fluid substance, which would solidify with comparative rapidity to form dikes. In stratified rocks dikes usually cut at some angle across the strata. Where the molten material intrudes itself between the strata parallel to the bedding planes in broad sheets, it is called an intrusion-sheet or sill. Where the overlying strata become lifted and arched upward into a huge dome without breaking above and letting the fluid rock escape, the solidified lenticular mass constitutes a laccolith or laccolite. Where the molten rock actually escapes to the surface by means of a fissure or other conduit, and flows out over it in a broad sheet, it is termed a flow, lava-flow, or extrusion-sheet. The interval of time elapsing between the outbreak of the magma from its reservoir and its subsequent cooling to the solid state is termed the effusive period. If the conduit is rudely cylindrical the lava accumulates about the vent, forming a lava or volcanic cone. Subsequent erosion may entirely remove the cone and expose the cold lava in the conduit, to which the term volcanic neck is applied. In fact it is only through the exposure of these deep-seated masses of cooled igneous material by erosion that we are enabled to study them. Over the more ancient land areas many miles of rock, vertically measured, have been removed, laying bare the underlying rocks to a corresponding depth.

The Modern Conception of Rock Magmas.—The popularly accepted idea of lava is that it is rock which has been fused by great heat. In fact the older conception of scientific men was that magmas consisted of fused rock-masses. Recent opinion, however, based on the revelations of the microscope and experiments in the synthesis of minerals and rocks, tends to regard them as solutions of one mineral substance in another or of several mineral substances mutually in each other. One of the chief reasons for thinking them such can be stated as follows: If magmas are fusions then the individual mineral constituents potentially present in them should crystallize out according to their fusibilities, beginning with the least fusible, but they do not. On the other hand, as the magma slowly cools, the first individual mineral species makes its appearance when the point of saturation for that particular species is reached, and the others follow in the order of their solubilities. For example, in granite (which consists of quartz, feldspar and mica or hornblende, with some accessory constituent, such as apatite or zircon, and, it may be, also a small amount of one or more of the ores),

the order of crystallization is: (1) the ores with apatite and zircon; (2) mica or hornblende; (3) feldspar; (4) quartz. Quartz is the least fusible, and should appear first under the fusion theory. As a matter of fact it appears last. In short, all of the materials appear in the reverse order of what we would expect if they are true fusions. But they do appear in the order of their solubilities. Pressure, however, exerts an important influence upon the solvency of a substance, and as this is variable the order of appearance is not absolutely fixed. Moreover, heat, the most important factor involved, is very variable, and still farther modifies the problem.

The Splitting or Cleavage of Magmas (Spaltung, Magmatic Segregation, Magmatic Differentiation).—When a magma cools, the first minerals to appear are the ores (with apatite, titanite, zircon, etc.); following these, the basic ferromagnesian constituents; then the more basic plagioclase feldspars, followed or overlapped by the orthoclase varieties; and last of all, quartz, if more than enough exists for the formation of the silicates. Obeying the principle of diffusion, the first minerals to form—the more basic ones—tend to accumulate on the cooling walls, that is, at the periphery of the magma-basin; and the other minerals arrange themselves rudely in concentric zones, each zone toward centre being successively more acid, until at the centre the magma becomes comparatively acid and may, after solidification, consist largely of such minerals as orthoclase and quartz. This arrangement of the minerals by diffusion before crystallization results in the rude separation of an originally uniform magma into several magmas of different chemical compositions, which, on cooling, furnish rocks of different mineralogical compositions. The process is termed the cleavage of magmas.

Definitions depending upon internal characteristics will next be considered.

Texture.—The fluid magmas of igneous rocks may be compared to molten glass. If the cooling period be long the individual minerals form comparatively large crystals. If it be short the crystals are correspondingly small. If it chills so suddenly that the molecules of the different mineral compounds do not have time to unite to form crystals, but are caught just as they existed originally in the fluid magma, the result is a volcanic glass. Rocks in which the crystals are five millimeters or more in diameter may be called coarse-grained; rocks in which the crystals range in size from one to five millimeters, medium-grained; and those in which they are one millimeter or less in diameter, fine-grained. Rocks in which all of the original magma has individualized or crystallized, to form minerals of some sort, and in which there is no unindividualized material remaining behind in the form of glass, are called holocrystalline. All rocks in which the crystals are large enough to be seen with the unaided eye are termed phanocrystalline, or phaneric. Those rocks in which the crystals are too small to be distinguished megascopically are called aphanitic. Many aphanitic rocks, however, under the microscope are seen to be holocrystalline and to consist of small crystals of minerals which can be specifically identified with the aid of that instrument. For these rocks the

term microcrystalline has been proposed. But the crystals, though recognizable, may be too small to be specifically identified even with the microscope. Such rocks are called microcryptocrystalline. Volcanic glasses show only embryonic crystals imbedded in textureless glass. Such rocks are said to be vitreous or glassy.

If during the entire period of solidification the conditions of cooling remained the same and the entire process of cooling of a deep-seated magma was slowly and quietly accomplished in the magma-basin, unattended by any effusive period, the rock would be coarse (to fine), evenly-granular. In rocks cooling under these circumstances the growing crystals have usually interfered with each other in such a way as mutually to destroy their crystal boundaries, forming irregular interlocking grains, with no one diameter much greater than the others. In other words, the grains are irregularly rounded. A texture of this sort is characteristic of the granites, and is called the granitic or granitoid texture. The term allotrimorphic, referring to the fact that the crystals do not possess their own boundaries, is applied to the same texture, and a still newer term, xenomorphic, has recently been proposed. Where the majority of the crystals do retain their crystal boundaries, the resulting texture is called idiomorphic or automorphic. If the crystal boundaries are only faintly or imperfectly discernible, the structure is said to be hypidiomorphic.

The period of solidification within the earth may be interrupted by an effusive period; in which case those crystals which had begun to form, and may have reached considerable size are carried by the eruption into other surroundings, where the cooling process may be much accelerated. A second generation of smaller crystals would then form about the large well-formed ones, imbedding them in a fine-grained ground-mass, producing what is termed porphyritic texture. Two or more generations of crystals may thus be recognized. The well-defined crystals of the first generation are called phenocrysts. The term felsite is applied to the fine-grained ground-mass of the acid rocks.

The crystals of some one mineral species in a rock may have one diameter much larger than the others. The crystals then appear distinctly lath-shaped in thin section under the microscope. This form of crystallization is especially common with the plagioclase feldspars. These laths of plagioclase are enclosed by crystals of another species. This texture is common, and in the scheme of classification of igneous rocks at present accepted is called into rather prominent requisition. It is known as the ophitic texture.

Flow-structure is exhibited by the parallel arrangement or orientation of minerals in lines which indicate the direction in which the fluid rock had been moving before solidification took place, or while it was in a viscous state.

Classification of Igneous Rocks.—The classification of igneous rocks as at present widely accepted is based upon three things: (1) chemical composition; (2) mineralogical composition; (3) texture. (The proposed 'Quantitative Classification of Igneous Rocks,' published jointly by Cross, Iddings, Pirsson and

Washington, Chicago 1903, is the most elaborate attempt at a thoroughly scientific classification of the igneous rocks yet proposed. It has not, however, as yet received general acceptance).

Chemical Composition.—The chemical composition of igneous rocks is primarily expressed in terms of silica percentage. Rocks which contain from 60 to 80 per cent of silica are called acid. Most of these rocks contain free quartz; those which range from 40 to 60 per cent in silica are called basic and rarely possess free quartz in any considerable amount; while those which fall below 40 per cent are termed very basic, and practically never contain original free quartz. Generally speaking, as the silica percentage declines the percentage of the bases (lime, iron, magnesia) increases. This change in chemical composition from acid to very basic is indicated by change in color, the acid rocks being light ashy gray, while the very basic are dark.

Mineralogical Composition.—Quartz is more or less abundant in rocks of the acid division, but soon disappears in passing toward the basic end of the series. Orthoclase is the dominant feldspar among the acid rocks, but even here the plagioclases are more or less common. Among the basic rocks the plagioclases prevail, and in a general way change from the albite to the anorthite variety as the more basic rocks are approached, but fail entirely in most rocks of the very basic division.

The ferromagnesian minerals are subordinate, almost negligible, in the very acid rocks. They become dominant in the basic and constitute the bulk of the very basic rocks.

The ores, chiefly magnetite, chromite and ilmenite, are found more or less sparsely disseminated through all three divisions, but they become notable constituents among the basic and very basic rocks and may even segregate to form important bodies of ore.

Texture.—As already explained, magmas which solidify deep within the lithosphere usually form coarse (to fine) evenly-granular rock-masses, having the granitoid texture, although they may be more or less porphyritic or idiomorphic in character. These deep-seated rocks are called plutonic. Where eruption takes place those rocks which solidify somewhere between the magma-basin and the surface (as intrusion-sheets, dikes, laccolites, etc.) are called intrusive, while those which cool subaerially (or it may be beneath bodies of water) are called effusive or extrusive. While neither the plutonic, intrusive nor extrusive members are limited to any one kind of texture, it is true that the plutonic rocks are more frequently granitoid, and the intrusive and extrusive members even-fine-grained, felsitic, asphanitic or porphyritic in texture, while the textureless volcanic glasses are nearly always extrusive.

Rock-families: I. Acid Division; Granites.

—The granites are plutonic rocks occurring frequently as huge irregular masses which have slowly melted their way up from some deep-seated region into the more ancient and then deeply-buried portions of the lithosphere; or they may occur as apophyses or dikes given off from some parent mass. Mineralogically they consist of quartz, dominant feldspar of the orthoclase variety (with subordinate amounts of soda-orthoclase, microcline or oligoclase), and muscovite or biotite mica, or both. Typical

granite has muscovite. Where biotite alone is present it is called granitite. Where hornblende or tourmaline replaces the mica, the rock is called hornblende- or tourmaline-granite. Where feldspar fails and only quartz and mica remain, the rock is called gneiss. As accessory constituents might be mentioned, zircon, allanite, cassiterite, rutile, titanite, magnetite. By a gradual decrease of quartz the granites pass imperceptibly into the syenites (to be described later), and by similar changes into the diorites.

There is a form of granite called pegmatite, which is found in veins or dikes. It is very coarsely granular. The crystals of feldspar sometimes measure a foot or more in diameter, while the quartz and muscovite crystals correspond in size. Pegmatite is the source of nearly all of the white mica of commerce. It is also remarkable as being the home of a variety of extremely rare minerals—compounds of thorium, lanthanum, yttrium, etc.—among which may be mentioned uraninite or pitch-blende, the present source of radium. Pegmatite is characterized by the interesting parallel intergrowth of feldspar and quartz called graphic granite. Pegmatite is particularly noteworthy, however, as having been deposited from an intensely heated aqueous solution, perhaps from vapor of water (mingled with other gases, such as carbonic acid, hydrofluoric acid, boracic acid, etc.), which was under such great pressure that it bordered on the fluid condition. The minerals of pegmatite, more particularly the quartz crystals, are frequently filled with fluid inclusions of water or carbonic acid. A great variety of minerals and a few rocks are considered to have been formed in this manner, and are said to be of pneumatolytic origin (Greek, *πνευματώδης*, to turn into air), and such processes are termed pneumatolytic processes. Furthermore, since these processes usually succeed some great volcanic outbreak, they are termed post-volcanic processes.

The granites as a family have a range in silica which varies between 65 and 80 per cent.

Where a magma of the chemical composition of granite erupts it may form dikes, sheets or flows. The rocks may have a variety of colors, but they are prevailing light ashy gray. Where crystalline, they possess the same mineral constituents as granite, except that the feldspar is apt to be the glassy variety of orthoclase called sanidine. The porphyritic texture prevails among the intrusive and extrusive forms alike.

The geologically older intrusives of this family are called quartz or orthoclase porphyry according to whether the phenocrysts imbedded in the felsitic ground-mass are quartz or orthoclase. The strictly extrusive forms of granitic composition are known as rhyolites (from the Greek word which means to flow), so called because of the flow-structure which is commonly developed in them. The rhyolites are rarely holocrystalline, containing nearly always more or less glass and occasionally consisting wholly of it. These entirely glassy forms of rhyolite are called obsidian. Perlite and pitchstone are varieties of obsidian. Occasionally the rhyolites are frothy in character, due to the rapid escape of steam resulting from the relief from great pressure. This form is

known as pumice. Rhyolite is also called liparite because extruded abundantly from the volcanoes of the Lipari Islands.

Syenite.—The hornblende granites, as already explained, are those in which the mica has been replaced by hornblende. An occurrence of such a rock at Syene (now Assuan) on the Nile, was called syenite from its locality. Of late the term has been restricted to quartzless rocks consisting primarily of orthoclase and hornblende. Rocks of the syenite family usually carry varying amounts of plagioclase and may contain subordinate quartz. Apatite, zircon, titanite and magnetite are uniformly present as accessory constituents. In texture they are granitoid and, by an increase of quartz, grade over completely into the granites, or by an increase of the plagioclase pass over into the diorites (described below). Where augite replaces the hornblende the rock is called augite-syenite; where mica replaces it, minnette. Nepheline and orthoclase constitute nepheline-syenite.

The range in silica percentage for the typical syenites is between 55 and 65 per cent.

When a magma having the chemical composition of a typical syenite erupts it forms dikes, sheets and flows, closely resembling the eruptive forms of granite, but without quartz. The loosely applied mining term porphyry is used indiscriminately for the eruptive members of both the granite and syenite families. True eruptive syenite, however, is called trachyte, from the Greek word which means rough. The most typical occurrences are light-colored, ashy-gray rocks, either aphanitic or porphyritic in texture, with usually some glass in the ground-mass. When porphyritic the phenocrysts are of the glassy variety of orthoclase called sanidine. In fact, the entire felspathic constituent is chiefly of this variety.

The eruptive rock having the composition of nepheline-syenite is called phonolite because of the ringing sound which thin plates make when struck with a hammer.

Rock-Families: II. Basic Division; Diorites.—These diorites are plutonic rocks having a silica percentage running from 50 to 65 per cent. They are of medium acidity and the magmas from which they are formed may be considered as approaching closely the hypothetical parent magma from which, by the process of cleavage, the other rock-families, acid, basic and very basic, may be thought of as having originated. Mineralogically they consist of hornblende and plagioclase feldspar. Those in which mica replaces a part of the hornblende are called mica-diorites, while the same constituents plus quartz go by the name of quartz-diorites or granite-diorites. These rocks mark the transition to the granites. Augite-diorites are rocks of the diorite type, in which hornblende is replaced in part by augite. They grade over into the gabbros.

Extrusive rocks having the chemical and mineralogical composition of the diorites are called andesites. Typical andesites are aphanitic, felsitic or porphyritic in texture and closely resemble the trachytes, the main distinction being that they contain plagioclase (andesine or oligoclase) instead of orthoclase. The ferromagnesian constituent is usually hornblende, but may be either biotite or augite. The rocks are

named because of their common occurrence in the Andes Mountains.

Acid andesites containing free quartz are known as dacites, a name derived from the old Roman province of Dacia, now a part of Hungary.

The Gabbros.—The gabbros are coarse- to fine-granular, granitoid rocks of plutonic origin, having a silica percentage ranging from 45 to 55 per cent. As originally defined they consisted of plagioclase (labradorite) plus a pyroxene, of the variety known as diallage; but more recently the name has been applied to a great variety of rocks consisting of a plagioclase (at least as basic as labradorite) plus any kind of pyroxene, either monoclinic or orthorhombic. If olivine be present it is known as olivine gabbro.

The name norite is applied to that member of the gabbro family which consists of plagioclase and enstatite. If olivine be present it is called olivine-norite. The ferromagnesian constituent may fail and the rock thus consist of labradorite feldspar alone, in which case it is known as anorthosite (from the French word for triclinic feldspar).

The accessory mineral constituents are apatite, titanite, ilmenite, magnetite. The first and last mentioned are usually abundant, and the latter may segregate to form ore deposits.

Diabases.—These may properly be discussed in connection with the gabbros, for they have the same mineralogical composition. Their chief distinguishing feature perhaps is their texture, which under the microscope, if not in the hand-specimen, is seen to be ophitic. This, in short, is the essential distinction between the gabbros and the diabases as ordinarily considered. In granularity they range from coarse to aphanitic. They are sometimes strikingly porphyritic, with perfect automorphic phenocrysts of augite imbedded in an aphanitic, ground-mass of augite and plagioclase (labradorite or anorthite). The basalts or traps are the dense black aphanitic extrusive equivalent of diabase, but they grade over into the diabases by imperceptible stages. The basalts constitute great surface flows of unparalleled extent, covering thousands of square miles. On cooling they frequently break, by shrinking, into hexagonal prisms, which have their long diameters normal to the cooling surfaces. This is known as the columnar structure of basalt, so famously exhibited at the Giant's Causeway, on the northeast coast of Ireland.

Olivine is a more or less constant mineral in the basalts, which have been divided into the olivine-free and olivine-bearing varieties.

Very Basic Division: Peridotites, Pyroxenites, Hornblendites and Dunites.—Rocks of this division, as already explained, include those from which not only free quartz has disappeared, but also the feldspars, at least as notable constituents. They consist essentially of a mixture of ferromagnesian constituents plus one or more of the ores. Olivine and pyroxene (usually augite) together constitute peridotite (from the French word for olivine). If hornblende be substituted for augite the rock is known as hornblende-peridotite. If the rock consists essentially of pyroxene it is called pyroxenite; or of hornblende alone, hornblendite, or of olivine alone, dunite. They have as accessory constituents magnetite, chromite, il-

menite and apatite. Chromite rarely occurs in such abundance in the peridotites as to be of economic value.

A certain rare basaltic rock of the mineralogical composition of peridotite, consisting of augite and olivine in a glassy ground-mass, occurs at Limburg in Kaiserstuhl, Baden. It is called limburgite. Dense porphyritic rocks consisting of augite and magnetite in a glassy ground-mass represent the effusive member of the pyroxenites and are called augitites.

Pyroclastics.—Igneous rocks belonging to any of the above families may, by violent eruptions, be blown into fine particles known as ash, or if coarser as lapilli or bombs. These may accumulate and ultimately consolidate, the fine-grained material constituting tuff, the coarser material being known as volcanic breccia or agglomerate. See PYROCLASTIC.

SEDIMENTARY ROCKS.

Rock Disintegration.—Granite is one of the most abundant and widespread of igneous rocks, and is a most important species among the numerous other primitive rocks of the lithosphere. The changes which take place in it in the process of its decay can be taken as illustrative of those which take place in the disintegration of all other primitive rocks. Granite consists of quartz, orthoclase feldspar (with some soda-orthoclase microcline or plagioclase), and light or dark mica, or both, or perhaps hornblende in place of the micas.

On decomposition under the influence of atmospheric agencies it falls to a more or less rusty, clayey mass of sandy or gravelly material, the sandy or gravelly part consisting of angular fragments of the original quartz (which is practically unaffected by atmospheric agencies), and fragments of still undecomposed feldspar. The clayey portion of the alteration products results from the decomposition of the feldspar and consists largely of kaolin, which in a pure condition is a white powdery or plastic material, according to whether it is dry or wet. It is usually stained rusty brown by iron oxide, which results from the decomposition of any ferromagnesian constituent contained in the rock or from small particles of some one of the ores which are quite certain to have been present in small amounts. Certain constituents of the original minerals are carried off in solution; the alkalis and a part of the silica of the feldspars; also a portion of the iron of the ferromagnesian minerals, together with some of the magnesia and much of the lime that may have been present as a minor constituent.

This mass of loose, more or less rusty, incoherent material remaining behind is termed residual granite. Rocks of whatever nature are in like manner subject to decomposition by atmospheric agencies, and their residual materials everywhere cover the greater portion of the surface of the underlying rocks, and constitute what is termed mantle-rock or detritus. A part of this mantle-rock consists not of residual material in the strict sense, but is made up of angular fragments of various sizes, which have been broken from the rock-masses by the action of frost. At the foot of nearly every steep cliff is to be found an accumulation of angular rock-fragments called talus, rock-slide or breccia.

Removal of Rock-waste and Its Deposition in the Form of Sediments.—Most of the various materials of the mantle-rock, whether residual or fragmental, find their way sooner or later, chiefly by the action of rain or frost, to the neighboring streams, and are borne by them to the rivers, which in turn transport them, after numerous halting-periods, to the sea or to smaller bodies of salt or fresh water. In this process of transportation the angular rock-fragments are reduced by attrition to rounded pebbles. The angular grains of quartz also become rounded and water-worn, while much of the material becomes reduced to an impalpable mud. These more or less finely comminuted and abraded materials are distributed along the shores of lake or sea. Gradually the finer, more easily suspended and transportable materials are carried out into deep water, the finest and most impalpable muds being transported farthest from the shore; so that, broadly speaking, the washings from the land surface become distributed over sea and lake bottom in order of fineness, beginning with the coarsest gravelly materials at the shore-line, and growing successively finer toward the deep water, where finally only the impalpable silts and muds are deposited.

Stratification.—In addition to this more or less gradual horizontal change from coarse to fine material brought about by the transporting power of water, there is always to be observed a much more sudden and abrupt change vertically, by which materials of various sorts and degrees of fineness are arranged by the sorting power of the same medium (water) into horizontal beds of varying thickness, which are separated from each other by sharply defined planes of demarcation called sedimentation or bedding planes. Beds which consist of the same material mineralogically are called strata. But a stratum may be made up of thinner beds, owing to a difference in the fineness of the material which composes it. These subdivisions of a stratum are called layers, and layers in their turn may be composed of extremely thin beds, only the very small fraction of an inch in thickness, called laminae. Strata vary in thickness from a few inches to several feet. All materials deposited in water are called sediments; and all sediments were originally deposited in nearly horizontal position. These nearly horizontal strata slope or dip slightly toward deep water, and this slight inclination is known as initial dip. All materials deposited in water are stratified, and this is the chief characteristic of all rocks so formed. Rocks of this character are called sedimentary.

Consolidation of Sediments into Coherent Rock-masses.—Sediments have accumulated to a very great thickness during geologic time. Those sediments which have been deeply buried and have been subjected to great pressure have been made to cohere either as a direct result of this pressure or by cementing together of the particles by mineral substances in solution; namely, silica, carbonate of lime, or some compound of iron. These rocks of sedimentary origin may be further classified as aqueous, eolian, or glacial, depending on whether they are formed by water, wind, or glaciers.

Rocks of Aqueous Origin.—Rocks deposited in water are usually stratified. In this respect they are distinguished from typical

igneous rocks, which are unstratified and massive. Aqueous rocks can be classified as follows: (1) Mechanical sediments of terrigenous origin; (2) sediments of organic origin; (3) chemical precipitates.

Mechanical Sediments of Terrigenous Origin.—Included here are all those substances which have been washed from land surfaces and deposited in the seas or other bodies of water, as above explained. The principal varieties are: (1) Conglomerates, otherwise known as pudding-stones. These are solidified gravels, in which coherence is due to some cementing principle (lime, iron, or silica), to pressure, or to both. Where the fragments of rock are angular, as though freshly broken, the rock is called breccia. Breccias are not all of water origin. They are occasionally terrestrial. In either case they have not been transported far from the parent ledge, as their sharp corners indicate. (2) Sandstones, consolidated sand-beds. Where the cement is calcareous they form calcareous sandstones. They are also called silicious or ferruginous, according to the character of the cement. Argillaceous sandstones contain an admixture of clay. Coarse sandstones containing grains of undecomposed feldspar are called arkose. (3) Shales, solidified clays or muds. They may contain some sand, and are then said to be arenaceous; or they may contain lime in the form of shell-fragments or impalpable limy material, and are lacustrine; and those made by rivers are alluvial or fluvial.

Mechanical sediments of the character above described accumulate alike in seas, in lakes, and on river flood plains. Those deposits made in the sea are called marine; those made in lakes, lacustrine; and those made by rivers are alluvial or fluvial.

Sediments of Organic Origin.—These may be the result of the accumulation of either animal or plant remains. The accumulation of hard parts of animals, such as the shells of mollusks and other mollusk-like forms, the framework of coral polyps and echinoderms, and the microscopic skeletons of some of the protozoans, form the bulk of limestone and other chemically similar deposits. Coquina, the Florida limestone, is composed of a mass of mollusk-shells; crinoidal limestones of the fragmentary skeletons of those marine forms so abundant during Paleozoic time. Coral limestones are formed by the building up of coral reefs and by the accumulation of fragmentary coral materials and finely divided coral muds, which may be distributed widely over the floor of the ocean by currents, forming compact calcareous rocks. Calcareous accumulation of this particular sort are considered to have been changed to dolomites by the action of the salts of magnesium in the sea-water, on carbonate of lime, replacing part of the calcium by magnesium and forming $(Ca,Mg)CO_3$ out of $CaCO_3$. This imperfectly understood process, by which limestones are changed to dolomites, is called dolomitization. Dolomites and limestones grade into each other and together are among the most common and important rocks of the lithosphere.

Chalk is an accumulation of minute calcareous shells secreted by the lowest forms of animal life, the protozoans, certain forms of which abound in the surface waters of the oceans.

When they die their shells rain down through the water and accumulate on the floor of the high seas, forming oozes. The chalks are considered to have originated in a similar manner during past geologic time.

Chief among the accumulations of plant remains is peat, an accumulation of vegetable materials in swamps or moist places. It is a dark brown or blackish residuum left by the partial decomposition of mosses and other vegetable accumulations, not always made strictly in the water, but always in moist places, and usually in the waters of swamps. Similar vegetable accumulations on a most extensive scale have been formed during past geologic time, and now constitute beds of lignite and bituminous and anthracite coal. Diatomaceous or infusorial earth is a silt-like deposit consisting mostly of the microscopic silicious shells of that low order of plants called the *Diatomacea*.

Chemical Precipitates.—Briefly enumerated, these are salt and gypsum, found in alternating beds, and considered to have formed by the evaporation of salt lakes, or by the isolation and evaporation of bodies of sea-water. Calcareous sinter or tufa consists of carbonate of lime, which has been brought up in solution in the waters of hot springs and deposited as porous or cellular material about their vents. It is also deposited from solution in the waters of rivers and lakes, and occasionally forms deposits of considerable extent. Travertine is a more compact form of the same material, as is also Mexican onyx.

Eolian Rocks.—In regions unprotected by vegetation, as long sea-beaches, the shores of lakes, or in the region of deserts, the finer sands are picked up by winds and drifted like snow into oval or rounded hillocks called dunes. Often these drifting sands are a menace to agriculture, since they gradually encroach upon and bury under them, the arable land. Sands thus deposited by winds are only rudely stratified. In the same manner fine impalpable dust is transported long distances, and gradually accumulates to form loess. The loess deposits of China are locally over 1,000 feet thick. Similar accumulations occur in the United States, Europe, and in Argentina. The Mississippi Valley loesses are believed by some to have been laid down in water under unusual conditions. True loesses are unstratified, and have a characteristic verticle cleavage.

Glacial Deposits.—The great continental glaciers that, geologically speaking, existed only yesterday over a large portion of the continents of the northern hemisphere, left behind them vast amounts of characteristic material, which was in part deposited by the glaciers directly and in part by the waters resulting from the melting of the ice. These latter deposits are, therefore, partly of aqueous origin, and are called fluvio-glacial. Glacial drift is the general term applied to all the materials resulting from glacial action direct or indirect. Glacial till is the dense bluish clay, with numerous imbedded boulders, characteristically striated, formed underneath the glaciers (sub-glacial material). This till-sheet (or ground-moraine) is found over a large portion of the area covered originally by the glaciers, and varies in thickness from zero to hundreds of feet. Other sub-glacial accumulations are called drumlins,

till-billows, till-tumuli, crag-and-tail, etc. Materials dumped down at the margins of the glaciers in confused heaps are termed moraines (terminal, lateral, or medial). Streams flowing within or underneath the glaciers deposited along their courses material (sand, gravel, clay), which remained behind after the melting of the glaciers in elongated ridges called eskers or osars. Where these streams issued at the margin of the ice-sheets they left irregular mounds called kames. Streams flowing on the surface of the ice would likewise accumulate materials of the same sort, which would remain after the melting of the ice as long serpentine ridges known as super-glacial kames or eskers. These floods of water escaping from the glaciers carried the gravels, sands and silts far beyond the margins of the glaciers, and deposited them as deltas, fans, overwash aprons, and valley trains.

METAMORPHIC ROCKS.

The Metamorphism of Sediments.—Those most ancient of all sediments which were derived from the disintegration of the original or primal rocks of the lithosphere, and which were first deposited in the primordial seas, have been so deeply buried in the crust of the earth as to have been affected by the uprising heat of the earth's interior. This heat, united with the tremendous pressure exerted by the superincumbent mass of sediments and the dissolving effect of the intensity (super-) heated moisture present have changed these old rocks into thoroughly crystalline masses, consisting of distinct mineral aggregates more or less resembling the crystalline rocks of the igneous type, but different from the latter chiefly in this, that the original stratification (bedding) planes are still visible. Such rocks are utterly changed in everything except their chemical composition from their original condition and appearance and are said to be metamorphosed. As a class they compose the metamorphic rocks. It is not alone these ancient sediments which have suffered transformation. Sediments of every geologic age have been found in some quarter of the globe in the metamorphosed condition.

There are two kinds of metamorphism: contact and regional. Contact metamorphism is produced by the heat of intruded masses of igneous material upon the surrounding rocks. The contact zone or area about the intrusion affected by its heat is usually narrow, but it may extend for rods or even miles from the intruded mass. The changes resulting from contact metamorphism are not so important in the production of altered rock-masses as they are in the formation of new minerals, so that they are of more especial importance to the mineralogist.

Regional metamorphism, on the other hand, as the name implies, has been exerted over wide areas, and has produced the most profound and far-reaching effects. By it the rocks over many thousands of square miles have been completely altered from their original condition. As a result of pressure the older deeper-seated rocks (as well as some of the more recent ones) have been intensely folded, plicated and sheared, which folding and shearing alone would be sufficient to alter them completely. Metamorphic rocks have other structures developed in them,

such as crushing; jointing (series of more or less parallel cracks intersecting each other at nearly right angles and breaking the rock-masses into blocks with rudely parallel sides); faults (produced by the slipping of the walls of rock on either side of a fissure over each other); slaty cleavage (produced by great pressure exerted at right angles to the cleavage surfaces); fissility (the visible separation of rocks into thin plates, also due to pressure, and attended by slight movement of the plates on each other); schistosity or foliation (the property of splitting into plates with rough undulating surfaces, due to the parallel orientation of the mineral crystals). This may be cleavage, fissility, or both.

The same processes of metamorphism, so potent in the transformation of true sediments, are just as efficacious in producing changes in the igneous rocks themselves, by virtue of which processes the igneous rocks frequently become so profoundly altered as to be utterly unrecognizable.

The metamorphic rocks as a class are completely crystalline, and in this respect resemble the igneous rocks of plutonic origin. Their chief varieties will now be considered.

Gneisses.—Disintegrated or residual granite consists of disaggregated particles of quartz and more or less thoroughly kaolinized feldspar, with considerable true clayey residue resulting from the complete decomposition of some of the feldspar, all somewhat tinged by the oxide of iron. It is easy to see how a similar assemblage of materials could be brought together upon a sea-beach. By a subsidence of the area and a continued deposition of other sedimentary materials above them, that first assemblage of sand and clay might become so deeply buried as to come within the sphere of metamorphic action. If subjected to heat and pressure, the elements present would recrystallize as quartz, feldspar and mica. In being so altered it would not necessarily have its original bedding-planes obliterated, and the rock would have the mineralogical composition of granite, but obviously would be of sedimentary origin. A metamorphic rock of such a character would be called gneiss. In the same manner a variety of mixtures might be altered with the same result. Conglomerates are known thus to pass by imperceptible gradations over into gneisses. An arkose might alter to gneiss. If the material originally contained much iron, then hornblende, or some other ferromagnesian mineral, such as biotite or augite, would result and the rock would accordingly be called hornblende-, biotite- or augite-gneiss. Garnets might result from the metamorphism and the gneiss would then be called garnetiferous.

Igneous rocks such as granites, syenites or gabbros, by process of metamorphism, may be altered into gneissic rocks. The chief metamorphic factor in the changing of igneous rocks to gneisses is, however, intense pressure, as a result of which even these most resistant of all rock-masses are made to flow like some viscous substance. This flowing, which is accompanied by more or less shearing, results in producing schistosity or foliation, which is accompanied by a distinct banding closely simulating original bedding, so that the rocks lose their original

massive form and come to resemble altered sediments. A granite in which this secondary banding or foliation had been produced would be called a granite-gneiss; a gabbro similarly altered would be termed a gabbro-gneiss, etc. In general we can say that a gneiss is any holocrystalline, foliated, metamorphic rock, of either sedimentary or igneous origin, which has the mineralogical composition of some one of the plutonic igneous rocks. It is frequently impossible to determine whether certain rocks are true sediments or altered igneous rocks.

Schists.—The term schist is applied to any metamorphic rock which, on account of the parallel arrangement of its crystal particles, tends to split more or less perfectly in parallel planes (schistosity or foliation). Clay upon metamorphosis yields mica. If little iron be present it furnishes muscovite (or sericite, its hydrated form), but if much iron be present it produces biotite. From this it follows that clay-beds on metamorphosis furnish mica of some sort or other, and as the rocks are always distinctly foliated, owing to the invariable parallel orientation of the mica-scales, they are called muscovite (or sericite) or biotite schists or, in more general terms, mica schist. Some quartz and feldspar may be present, but if subordinate they are still reckoned among the schists. Rocks of this character mark the transition of the schists into the gneisses. Mica-schists range in granularity from coarse- to fine-crystalline, the fine-crystalline varieties being called slates.

Quartz-schists are essentially quartz-rocks which contained originally some disseminated clay that altered to mica, as a result of the presence of which the rock has a schistosity. Many basic igneous rocks of the diabase order on metamorphosis change to hornblende-rocks. Where they are foliated they are called hornblende-schists. If more or less massive they are termed amphibolites. The diabases are very apt, however, to alter to chlorite schists, especially if the original augite was of the aluminous variety, and they may alter to biotite schists.

Other Metamorphic Varieties.—Pure quartz-sand metamorphoses to a holocrystalline rock called quartzite. Limestone metamorphoses to a more or less coarsely crystalline rock consisting of grains of calcite. If fine, even-granular, it is known as marble. If coarse-granular, it is called crystalline limestone or simply limestone. But the term marble is used to embrace all crystalline calcite rocks that are susceptible of a polish. Serpentine results from the metamorphosis of basic igneous rocks consisting largely of the non-aluminous varieties of hornblende or pyroxene and olivine. The peridotites are especially susceptible to this change. Anthracite coal results from the metamorphosis of bituminous coal, which in turn is derived from peat or lignite. In certain extreme cases of metamorphism anthracite becomes altered to a graphitic material.

FREDERICK B. PECK,
Professor of Geology and Mineralogy in Lafayette College, Easton, Pa.

ROCKVILLE, rōk'vil, Conn., city in Tolland County and on the New York, New Haven and Hartford Railroad, about 16 miles east-northeast of Hartford. Electric lines extend to Hartford, Ellington and other places. Shenip-

sit Lake, nearby, is more than two miles long and drains into the Hockanum River, which has here a series of falls, making in all a descent of 280 feet and furnishing Rockville with exceptional water power. The city was settled in 1716 by a colony from East Windsor and was a part of the town of Vernon until 1889 when it was chartered as a city. There are about 20 manufacturing establishments of importance, chief of which are envelope factories, silk and woolen mills, gingham and satin factories. The principal public buildings are the schools, churches and the library. The latter cost over \$100,000. There are eight churches, a high school, public and parish schools, two private schools and a public library. The government is administered by a board of aldermen, four members, and a council of eight members. Pop. about 8,000.

ROCKVILLE CENTRE, N. Y., village in Nassau County, Long Island, five miles east of the New York City line and 10 miles southeast of Jamaica. It is situated in an agricultural district and is largely residential. There are oyster and fishing interests and an increasing population. Pop. 5,223.

ROCKWELL, Alphonso David, American physician: b. New Canaan, Conn., 18 May 1840. He was graduated at Kenyon College in 1868 and at the College of Physicians and Surgeons in New York. He is a specialist in electrotherapeutics and neurology, having held a professorship in the former subject in the Post-Graduate School of Medicine and also in the New York State Women's Hospital. He was one of the three commissioners appointed to give advice on the establishment of the new method of execution by electricity adopted by the State of New York. He is the author of 'Relation of Electricity to Medicine and Surgery'; 'Nervous Exhaustion' (1901); and, with G. M. Beard, 'Treatise on the Medical and Surgical Uses of Electricity' and of many contributions to the medical press on neurology and physical methods of treatment. During the Civil War he was surgeon of the 6th Ohio cavalry in Sheridan's corps. He is neurologist-emeritus to the Flushing Hospital.

ROCKWOOD, Tenn., city in Roane County, on the Cincinnati, New Orleans and Texas Pacific and the Tennessee Central railroads, about 60 miles west-southwest of Knoxville and 88 miles north by east of Chattanooga. It is in a coal region in which there are extensive deposits of iron ore. The chief industrial establishments are blast furnaces, foundries, machine shops, coal yards, hosiery mills and lumber yards. The trade is chiefly in coal and in iron products. The value of taxable property is \$800,000. There are a high school and grammar school. The government is vested in a mayor and a board of five aldermen. The municipal receipts approximate \$25,000 yearly. Pop. 5,000.

ROCKY FORD, Colo., city in Otero County, on the Arkansas River, 53 miles south of Puebla, on the Atchison, Topeka and Santa Fé Railroad. It is situated in a rich irrigated farming district, is famous for the cantaloupes bearing its name and is largely devoted to the sugar-beet industry. There are canneries, creameries and beet-sugar factories. Pop. 3,230.

ROCKY GAP, Engagement at. On 5 Aug. 1863 Gen. W. W. Averell, with a brigade of cavalry and mounted infantry and a six-gun battery, left Winchester, Va., for a raid into West Virginia, which was to be continued to Lewisburg and the Virginia and Tennessee Railroad. He moved by way of Wardensville to Moorefield and to the upper valley of the south branch of the Potomac, and then to Huntersville, driving back Col. W. L. Jackson's cavalry. As he approached White Sulphur Springs, on the morning of the 26th, he encountered Col. Geo. S. Patton, who, with four small organizations of infantry, two battalions of cavalry and a battery, in all about 1,900 men and four guns, had been ordered to intercept him, and had taken position at Rocky Gap, the junction of the Huntersville road with the Lewisburg and Kanawha turnpike. Patton was strongly posted and Averell opened upon him with artillery and disabled two of his guns; but successive charges by Averell's dismounted force, with efforts to flank him, continued during the entire day, failed to dislodge him, and at night, after nine hours' fighting, the contending forces occupied the same positions as in the morning. Averell intended to renew the fight next morning, but, learning that Patton had received reinforcements from Lewisburg, made arrangements to withdraw. At 10 A.M. Patton attacked his left and half an hour later Averell ordered a retreat, which was conducted in good order on the road to Warm Springs, and thence by way of Huntersville to Beverly, which was reached on 31 August. The Union loss was 25 killed, 125 wounded and 67 missing, a total of 217; the Confederate loss was 20 killed, 129 wounded and 13 missing, a total of 162.

ROCKY MOUNT, N. C., city in Edgecomb and Nash counties, one mile from Tar River, 120 miles northwest of Wilmington, on the Atlantic Coast Line. It has a university school, a large trade in cotton and tobacco, and manufactures machinery, fertilizers, lumber, yarns, hosiery and cotton-seed oil. The city is growing rapidly. Pop. 11,461.

ROCKY MOUNTAIN GOAT, a goat-antelope (*Oreamnos montanus*), related to the chamois and serow, which inhabit the heights of the Rocky Mountains and Cascade Ranges between the forests and the snow line, from the 44th to the 65th degree of latitude. It is about the size of a common goat, but is stouter, handsomer and has stronger legs. It is completely covered with long, thick, white hair, which forms an erect mane along the middle of the back from between the horns to the root of the tail; the shoulders are rather humped and the head is habitually carried low. Both sexes have slender, smooth, black horns, curving backward, about eight inches long and sharp-pointed. Its pure white coat is a capital protection against observation in the midst of the mountain snow, and is unique, as no other white ruminant is known. Dwelling in such solitudes they have little to fear from natural enemies and fall an easy prey to the human hunter who has the hardihood to pursue them upon the rough mountain peaks and skill enough to get near to them unobserved. "Their food," says Wister, "seems to be chiefly the short almost lichen-like moss that grows on the faces and at the base of the rocks, and between them in the crevices.

I am inclined to believe that the goat keeps consistently to the hills, whatever the season may be, and in this differs from the mountain sheep, as he differs in appearance, temperament and in all characteristics, except the predilection for the inclined plane; and in this habit he is more vertical than the sheep." A variety from the Copper River region, in Alaska, is marked by a greater divergence of horns and some other structural characteristics and has been called *O. kennedyi*. The flesh of the mountain goat is not highly esteemed, but its hair was utilized in weaving by the Indians of British Columbia and the coast northward; and its tanned hide has a value in market as a rug. Consult Stone and Crane, 'American Animals' (new ed., 1914), and authorities on travel and sport in the Northwest.

ROCKY MOUNTAIN NATIONAL PARK, created by an act of Congress approved 26 Jan. 1915, is located in the northern part of Colorado and has an area of 358½ square miles. It includes the principal part of the Rocky Mountain Range, the highest point being Longs Peak, which is 14,271 feet, and 14 mountain peaks that are over 13,000 feet above sea-level. The park is accessible to tourists and travelers at numerous points on the eastern and western boundaries, where trails have been in existence for a number of years. The most central point from which the public can enter the park to different points therein is Estes Park, a small village located about three miles from the nearest point to the park boundary and approximately 7½ miles from the main entrance where the Fall River road enters the park. The nearest railroad stations to Estes Park are Lyons, Colo., 22 miles; Loveland, 33 miles; Fort Collins, 46 miles; and Boulder, 40 miles. Automobile stage lines during the tourist season make regular trips at special rates between these points and Estes Park. Consult Trowbridge, C. R., 'Rocky Mountain National Park' (Department of the Interior, Washington 1915 et seq.).

ROCKY MOUNTAIN SHEEP. See BIGHORN; SHEEP, MOUNTAIN.

ROCKY MOUNTAIN SUBREGION, a rather indefinite zoogeographical region embracing the elevated area occupied by the Rocky Mountains, which zoologically presents certain peculiarities very noticeable to a traveler from either the eastern lowlands or the Pacific Coast. The resemblance in the fauna is, indeed, rather to the East than to the West, as the Rockies do not form a zoological "divide" to anything like the extent which the Sierra Nevada does, nor even as completely as does the line of deserts which occupy the great depression of Nevada and Idaho between the Wahsatch Range and the Sierra Nevada.

A large number of species of animals and plants extend from the Mississippi Valley to and throughout the Rocky Mountains, in forms which are identical from one side of their wide range to the other, or which shade indistinguishably from one varietal extreme in the East to another in the West. On the other hand, the plants and animals common to both California and Colorado are comparatively few. The dry and foodless deserts of the Utah basin form a more potent barrier than the snows and altitude of either Sierras or Rockies. Thus the buffalo

formerly wandered throughout the whole network of interior valleys, and there is a special variety which seem never to have left the park-pastures and scantily timbered defiles; yet Bear River, Utah, on the border of the alkali basin, is the farthest west they ever got south of northern Idaho. The elk, grizzly and bighorn, the mountain goat, white ptarmigan and certain other examples of animals, are common to both the Sierra Nevada and the Rocky Mountain systems; but in all these cases they are species whose range extends far north where both lines of elevation converge in British Columbia. Yet the true "blacktail," or Columbian deer, is never shot east of the Cascades, nor does the Virginian, or willow deer, common enough in the Rockies, wander over to the Cascades or Sierras of Oregon and California.

To a more limited extent the Great Plains on the east serve as a barrier between the comingling of plants and animals indigenous to the mountains on the one hand and the Mississippi Valley on the other. And that this, as far as it goes, is a real barrier, is shown by the fact that many common weeds and trees, which flourish well in Colorado now, had never reached there until carried, either intentionally or accidentally by man; that is, the place was suitable enough to them, but they had never been able to reach it.

The Rockies, then, form a zoogeographical district, which embraces practically the whole system of complicated chains from New Mexico to the borders of Alaska, and there is a curious homogeneity throughout, a long list of insects, mollusks and animals of the lower classes, as well as of trees and herbs, occurring from the Rio Grande to the headwaters of the Saskatchewan, disregarding the difference in latitude, which in flat regions is the most powerful factor governing the distribution of animal and plant life.

This is not exceptionally the case in the Rocky Mountains alone, though here it is conspicuous and well-marked. It is true of the Ural-Carpathian system, of the Scandinavian ranges, of the Andes, of the great East-African system, of which Mounts Kilimanjaro, Kenia and Gordon-Bennett are peaks; nor is it difficult of explanation. A great mountain-province is really a series of sub-provinces concentrically arranged, or, to put it in another way, heaped on top of one another, for the largest bound, embracing the whole extent of the mountains and their foothills, contains several more or less restricted areas, determined by altitude, just as a vast lowland province, such as the whole eastern half of the continent, contains several well-defined subdivisions according to zones of climate, succeeding one another from north to south. The cause of the natural division of these sub-provinces is precisely the same in both cases, for, whereas in the Mississippi Valley the cooler or warmer average temperature required by each animal or plant for its best development is obtained by moving to the north or to the south, so in a mountainous region too much cold or too much heat can be avoided by moving upward or downward, and climate varies with altitude instead of latitude.

Hence, naturalists who have studied the mountains are able to mark out successive sub-provinces, according to altitude, within the upper and lower borders of which certain forms of

life are restricted, appearing neither below, or above, a limited number of thousand feet, except as occasional wanderers. Botanists have long recognized this.

Of course the number of varieties steadily decreases as one ascends just as on approaching the poles, because the means of supporting life diminish in proportion as a moderate climate and abundant vegetation are left behind. The hardy grizzly can stray to the utmost heights, as he is fond of doing, for his strength, power of locomotion and fasting abilities make it possible; but even he cannot remain there long, since food is very scarce beyond the timber. The eagle and greater hawks may soar above the naked icy crest of the loftiest summits, or perch upon the pinnacles, but they seek their prey and build their nests for the most part at far lower levels. A few small birds, like certain semi-arctic warblers and sparrows (especially the gay *Leucosticte* finches) and one large one (the well-known ptarmigan), the little-chief hare or "cony," which stores in its rocky tunnels a winter larder of roots and stems gathered at the edge of the snow during the brief summer, and a small variety of beetles and other insects more or less subterranean in habits, alone brave the storms and famine involved in continuous residence upon the higher summits.

Next below lies the zone of hardy plants and of a longer list of animals, such as the Canada jay, dusky grouse, several hawks and owls, the kinglets, water-ouzel, snow-birds and *Zonotrichia* finches, the bighorn sheep and a large variety of insects and snails. Below that, down among the pines and abundant shrubbery of the lower slopes and the foothills, one finds in summer the full measure of Rocky Mountain life.

An examination of these facts discloses that all the inhabitants of the lofty plateaus and the rocky peaks are arctic animals and some of them, like the ptarmigan, turn white in winter in true arctic fashion. These creatures, finding the same conditions at those great heights to which they are accustomed at lower levels inside the polar circle, can live and flourish on an arctic island, as it were, in the midst of the temperate zone; the long narrow snow peaks of the great range forming a tongue of polar climate stretching half way to the equator. It has thus been possible for the beautiful white goat, whose proper home is in British Columbia, to stray south along the crest of the Sierra Nevada and Rockies as far as these high mountains run, but he must keep upon the very crest, whereas in Alaska he comes down to the shore. The insects and minute life of the peaks of Colorado belong to the same class with (are often identically the same species as) those collected by polar exploring expeditions. The same is true of plants. "Red snow" and arctic lichens may be gathered on Pike's Peak.

It is natural, then, that two different migratory movements should be observable in the Rocky Mountains; one the regular seasonal movement southward in the fall and back in the spring, affecting chiefly those birds that live at the base of the range, or near it; and another movement, which is regularly made by many animals, upward to the cooler and fresher pastures in the summer, and back to the less snowy and more sheltered dells near the base of the mountains as winter approaches. Thus

vertical migration is very well understood in the case of the game, and the paths which the animals follow are often distinct.

The foregoing facts lead to an interesting generalization. While the southern peaks might be colonized by such stragglers from the north as the goat and the ptarmigan, whose legs or wings enable them to travel back and forth, there is a much longer list of small and practically stationary animals never found in the intervening valleys and totally unable to cross from one peak to another. Hence we must conclude that each lofty mountain top is a habitat by itself, entirely cut off from neighboring peaks where duplicates of its fauna and flora may be collected. On the tops of Mount Washington, in the White Mountains and Mount Marcy, in the Adirondacks, are insects and cryptogamous plants which do not occur anywhere between these isolated fragments of polar climate and the arctic circle, where the same butterflies, spiders and lichens are widespread and indigenous.

How shall this isolation of strictly circumscribed faunas upon mountain peaks be explained? Clearly it dates back to a time when communication between them existed. The ice-cap which, during the last Glacial Epoch, gradually overspread a large part of the north temperate zone and in the Rocky Mountain region covered the whole extent of their highlands with a thick mantle of snow and filled every canyon with local glaciers, of course crowded southward all the surviving life which had been wont, during the warm Tertiary time, preceding this cold period, to dwell far toward the north.

But when the epoch was on the wane, and the ice-front began to retreat, the relieved earth was again clothed with vegetation and re-tenanted by cold-loving animal life, which advanced northward closely in the rear of the retreating glacier. At a greater distance followed the more delicate animals and plants, gradually spreading northward as the moderating climate permitted, until they had established themselves in isothermal zones as we now find them. But as a subsiding flood will leave, stranded upon the top of the first points to appear above the surface, the driftwood and wreck of the deluge, so, as the warmth of southerly regions at a low elevation has increased, certain colonies of the advance guard of the army of animals and plants have found themselves stranded upon frigid mountain tops— islands of arctic climate— isolated from their fellows by warm valleys and plains in which their kindred speedily disappeared, overcome in the battle of life by the greater increase of lowland species to whom the circumstances were more favorable; but here on the high cold peaks they have been able to keep a stronghold, each in its own in a limited area, though surrounded by utterly fatal conditions.

Consult authorities cited under ZOOGEOGRAPHY, especially the writings of C. Hart Merriam.

ROCKY MOUNTAIN TROUT. See DOLLY VARDEN TROUT.

ROCKY MOUNTAINS, or CORDILLERAN SYSTEM, the system of mountains which constitute the major axis of elevated lands of North America, in the western part, extending from the Arctic Ocean on the north to South America on the south, and parallel

with the Pacific Coast. This great system of mountains is continued along the Pacific Coast in South America under the name Andes Mountains (q.v.). Between the Rocky Mountains and the Andes is a pass in Panama not many feet above sea-level. The width of the system varies; the greatest breadth is in the United States between lat. 38° and 42° N., where it is about 1,000 miles. The width diminishes north and south, increasing again in Mexico and diminishing only with the width of the continent. The highest point of the system is in Alaska, but the highest land mass is in the United States between 35° and 42° and on the eastern side of the system.

Ranges.—The ranges on the western boundary, and near the Pacific Coast are the Cascade and Sierra Nevada in the United States, the Sierra Madre in Mexico and Central America. West of the Sierra Nevada, in California, is the Coast Range. The Coast Ranges, Cascades and Sierra Nevadas are really separate mountain systems, folded at different times, and not genetically connected with the Rocky Mountains at all, although popularly spoken of as belonging to the Rocky Mountain System. The eastern chains in the United States, called the Rocky Mountain Range, extend north and northwest in the United States, approach nearer the Pacific in Canada, continuing into Alaska to the Arctic Ocean. On the east of the Rocky Mountain Range is the great central plain of the United States and Canada. Rising abruptly from this plain are many isolated cone-shaped peaks which gradually merge into ranges, forming an almost continuous eastern barrier, composed of short ranges, chief of which are Sangre de Cristo, Colorado or Front Range, Medicine Bow, Big Horn and Laramie. Farther east, in South Dakota and Wyoming, are the Black Hills, a mountain mass detached from the main ranges. In Wyoming the ranges divide, some extending southeast, others southwest and several short ranges having an almost east and west trend. Some of the well-known interior ranges are Wasatch, extending through Utah, and forming the eastern wall of the Great Basin, Wind River, Salmon River, San Miguel and Beaver River. Bitter Root Mountains form the divide between the headwaters of the Colorado and the Missouri rivers. In Nevada the short ranges are generally north and south; in the central and eastern part there are a large number of short, almost parallel chains. Other noted ranges are the Cœur d'Alene, the Lapwai and the Blue. The ranges south of the divide in Wyoming have a greater altitude than those north; but some of the southern ranges after leaving Colorado on the south and east end abruptly, and others slope gradually to the low desert plains. The greatest development is in Colorado.

Peaks.—In Colorado there are about 40 peaks which are over 14,000 feet in height. Among them are Grays Peak, 14,341 feet in height; Longs Peak, 14,271 feet; Pikes Peak, 14,134 feet. In the Sawatch Range, in Colorado, are Mount Harvard, 14,375 feet, and Mount of the Holy Cross, 14,176 feet. In the mesa region in western Colorado is Uncompahgre Peak, 14,408 feet; and in Sangre de Cristo Range is Blanca Peak, 14,463 feet. Other famous peaks, outside of Colorado, are, in Wyoming, Fre-

mont's Peak, 13,700 feet, in the Wind River Mountains; Mount Hayden, 13,691 feet, in the Sawatch Range. In the Colorado, or Front Range, there are four peaks over 14,000 feet; in Sawatch Range, 10 peaks; in the Sangre de Cristo, three; in the San Juan, four; in the Sierra Nevada, four. In Park Range (not group) and in the Pikes Peak Group, there is one in each. The highest peaks belong to the Cascade Range. Mount McKinley in Alaska is over 20,000 feet above sea-level; Mount Logan is 19,500 feet; Mount Saint Elias, 18,101; Mount Rainier, 14,444. Many of the peaks of this vast system, especially in the Cascade Range, are extinct volcanoes. In Mexico and Central America there are a number of active volcanoes. Orizaba, 18,300 feet in height; Popocatepetl, 17,887 and Ixtaccihuatl 17,343, are among the highest active volcanoes.

Plateaus.—The great plateau region included in the Rocky Mountain system is in southern Wyoming, eastern Utah, eastern Arizona, western New Mexico and western Colorado. The lands in Colorado and New Mexico east of the mountain ranges belong to the Great Plain. The Plateau region is bounded on the north by Sweetwater and Wind River Mountains. The general elevation of the whole plateau is about 7,000 feet above sea-level, but in Colorado it has an elevation of 10,000 feet. The Continental divide crosses this plateau; and within its limits are the waters of the three great river systems of the United States, the Mississippi, the Colorado and the Columbia. The southern part of the plateau has in places an abrupt ending, a steep, almost perpendicular escarpment. The ranges crossing, divide the plateau region into sections to which have been given the names Kaibab, Kaiparowits, Aquarius, Colorado, Markagunt, Paunsagunt, Paria, Shiwits, Tavaputs, Uinkaret, and others not so well defined as those named. On these broad plateaus are groups of mountains, buttes and isolated ranges and peaks. There are seven peaks over 13,000 feet above sea-level; five over 12,000 feet and less than 13,000 feet; and 20 over 10,000 feet and less than 12,000 feet.

Parks.—The parks of Colorado are high mountain valleys, known as North, Middle, South and San Luis, with an elevation of from 6,000 to 10,000 feet, surrounded by ranges of mountains from 3,000 to 4,000 feet higher. The west border of the San Luis Park is formed by San Juan Range, with its high peaks, more than 100 of them over 13,000 feet, bordering it like giant watch towers. The Uinta Range is west of North Park. The Parks, or enclosed mountain valleys in Idaho and Wyoming, are not so high as the Parks of Colorado. The most famous park in the whole Rocky Mountain System is Yellowstone Park (q.v.) in Wyoming, now a government reservation. The ranges on the boundaries of the Parks and rising from the Park Valleys, are grouped together as the Park Ranges or Park System. The mountains so designated are bounded on the north by the Laramie Plains, and on the east by the Great Plains. The southern and western boundaries are indefinite. Other noted parks are Monumental Park and the Garden of the Gods, near Colorado Springs. The 500 acres are covered with an extraordinary rock formation, like giant spires and pillars, and

some like vast cathedrals. The Yosemite Valley (q.v.) is often classed with the Parks.

Desert Region.—Within the area called by this name are vast arid regions, bare bleak mountains, and localities of almost barren lands, some of which might be made fertile by irrigation, and some fertile valleys. It includes the southern parts of Idaho and Oregon, the western parts of Utah and Nevada, the southeastern part of California, the southwestern part of New Mexico, the southern part of Arizona and the north central part of Mexico. The Sierra Nevada and Cascade ranges are on the western boundary; and the plateau drained by the Colorado River is on the eastern boundary. The greater part of this region is known as the Great Basin (q.v.) which has no apparent outlets to the ocean. The ranges, as in Nevada, are simple and narrow and separated by broad, level desert valleys. Geologically this basin is probably not strictly within the Rocky Mountain system.

Passes.—Several depressions in the ranges are called Passes, and some have been used for routes for railroads. A famous pass is the Lewis and Clark's, in lat. 47°. Through this pass the Northern Pacific Railroad has been built, and at Mullan's Pass it goes through a tunnel 3,850 feet long. The Truckee Pass, 6,000 feet above sea-level; the South Pass of the Wind River Range, Evan's Pass in the Front Range, which is crossed by the Union Pacific Railroad, are well known. In Canada the pass between Mount Hooker and Mount Brown, Athabasca Portage, is 7,300 feet above the sea. In the California mountains there are a number of passes. Where the rivers have cut their channels through the mountains, passes have been formed.

Lakes, Rivers and Glaciers.—The greatest rainfall is on the western slope, where the moisture brought by the winds from the Pacific Ocean falls. In the valleys and on the plateaus, especially where the waters fall down the escarpments, the rivers run through deep cañons, the most perpendicular sides of which are thousands of feet above the river beds. The rivers of the plateaus have their sources in the Park and Wind River Mountains, and in the Wahsatch Range. They have carved out deep gorges, which divide the region into a series of distinct plateaus. Some of the famous canyons of this region are the Grand of the Colorado, the Kanab and the Marble. The principal rivers within this region are the Green, Colorado, Sevier, Paria, Uinta and White. The rivers whose head waters are in the Sierra Nevada Range, flow to the Pacific, except a few, which flow east and are lost in the sands. The Sacramento and the San Joaquin are in the valley between the Sierra Nevada and the Coast Range. The one river comes from the north, the other from the south, almost parallel with the ranges until they unite, when they burst through the mountains and discharge their united waters into the Pacific Ocean. The Columbia is one of the great rivers of this region. Rising on the east side of the Cascade Mountains it flows south for some distance until finally it plunges through the mountains in a series of magnificent cascades, whence the name of the range. The Front Range in northern Montana bears upon its crest for many miles the continental divide which separates the

headwaters of the Missouri and the Columbia rivers. The Bitter Root Range separates the Missouri from the Salmon. The greatest water systems of North America have headwaters in the Rocky Mountains. The Colorado toward the south, the Yukon on the north, and the Columbia are the largest streams that flow toward the Pacific; the Mississippi, the Great Lakes and the Saint Lawrence, and the streams that flow into the Hudson Bay all reach the Atlantic Ocean; and the Mackenzie and its tributaries flow into the Arctic. The Rocky Mountains have many small lakes, formed by springs, and depressions which serve as basins. In the Great Basin are several bodies of salt water, the largest of which is Salt Lake (q.v.). The only crater lake in the United States is Crater Lake in the National Park. The glaciers of the Rocky Mountains are numerous. In Alaska are the largest and greatest numbers among which are Muir and Malaspina. Mount Rainier (q.v.) has over 30 glaciers, extending over a space of 100 square miles, and some of the ice walls reach a depth of 1,000 feet. The Puyallup and Mowich rivers drain five of the largest glacier rivers of Mount Rainier. A notable feature of these rivers is what is known as glacial tides, which are quite marked in summer time. Between midday and a few hours before sunset, there is an increase in the flow of water at the head of each river; about two feet in the narrowest part of the rivers. The vastness of Mount Rainier may be conceived when it is known that the surface, including the hill country at its base, has an area of 3,000 square miles. In other parts of the Rocky Mountains are found vast glaciers, and many of the peaks are ever whitecapped with snow.

Geology.—Throughout the Paleozoic era, the region of the Rocky Mountains was low and featureless, and under the sea a great part of the time but with several local emergencies. Toward the close of the era, in the Permian epoch, it was probably a desert, and at this time were laid down the red sandstones and gypsum beds that form so striking a feature of the eastern ranges. Land conditions obtained through Triassic and most of Jurassic time, but the region was not mountainous. Again in the Cretaceous most of the region sank beneath the sea for a short time. During all its history thus far the most important fact was the accumulation over all the region of the great series of sedimentary rocks that make the bulk of the mountains. During the late Cretaceous the region again became land, low and swampy, with the accumulation of coal beds. At the close of the Cretaceous there began a period of folding, which compressed and crumpled the rocks and arched them up into a great series of folds that constituted the first appearance of the Rocky Mountains. In the northern Rockies the compression was so great that the rocks broke and passed into enormous overthrust faults (q.v.) along which the beds slipped many miles. Following the uplift erosion set in and has been continuously carving the region ever since. During Tertiary times the area was the site of very extensive volcanic activity that poured out the great lava flows of the Yellowstone Park and other localities. There have been one or two later periods of slight uplift

and faulting, but no great folding since the close of the Cretaceous. The general trend of the folds and hence of the mountain ranges is nearly north and south, though a few lie nearly east and west. Erosion has planed off many of the folds, so as to expose cores of older granite, from which sedimentary beds dip outward in all directions. In the southwestern part of the system, faults are much more important than at the north, and great fault scarps are common.

Minerals and Mining.—The Rocky Mountain section is the great treasure region of North America. Almost all the precious and useful minerals are found here in abundance. Gold had been discovered and used by the aborigines, and deserted mines have been found where mining had been carried on in a crude way as early as 1680. Gold exists in nearly all the ranges of the system. Gravel containing coarse gold is found from 20 to 60 and even 100 feet below the surface. Abandoned gold fields were worked over with great profit during the last decade of the 19th century, by using improved methods. There are rich deposits of silver, copper, iron, salt, coal, lead and in the southwestern part of the United States, petroleum and gas. The placer gold regions in Alaska, and the gold fields of the same territory, have been found thus far of great extent and value. The value of the fine building stone, the fire-clay, gypsum, all kinds of cement material, are rarely taken into consideration because overshadowed by the value of the gold, silver and copper. The gypsum beds in the northwestern part of Texas and along the foothills of the ranges in southern Colorado are of great extent and value. For further details on minerals and mining see articles on the separate States of the United States in the Rocky Mountain region, also CANADA and MEXICO.

Climate.—The west slope of the Rocky Mountains, or all that portion which faces the Pacific Ocean, has a milder climate than the central or eastern part of North America in the same latitude. The warm winds from the Pacific Ocean bring heat and moisture. The rainfall is copious on the western side of the mountains. Like the mountain regions on all parts of the globe, the temperature lowers with increase of altitude, and the winds which here blow over the cold mountain tops and across the plateau region to the eastern slope carry with them neither heat nor moisture. In the southeastern part of this vast region where the mountains become low ranges or foothills, in the United States, west of the ranges that parallel the coast, the climate is hot in summer and mild in winter; in the Great Basin region and on the eastern slope of the mountains, extending out on the Great Plains, the climate is marked by aridity. See UNITED STATES.

Flora.—The great aridity of the region east of the western or coast barrier prevents the growth of vegetation. The surface is exposed to erosive action which is especially rapid at such great elevations, and the denudation becomes more complete as the sand and small disintegrated fragments are swept away by the winds, thus giving no opportunity for the accumulation of soil. A large portion of the central and eastern mountain region and the western part of the Great Plains require irrigation in order to have vegetation; this is so even in

the parts where there is abundant fertile soil. The arid portion of the United States, exclusive of Alaska, is about two-fifths of the whole area. The redemption of the arid lands is one of the nation's problems. Less than 10 per cent of the mountain region is forest-clad; but a larger proportion is covered with verdure, including the portions covered with dwarfed herbage, sage brush and stunted cedars and pines, most of which is useful for fuel but not for building purposes. Crops that mature in a short season and pasturage grasses are found on the foot-hills and valleys, especially along the streams. In some places where a little moisture is carried over the passes, below the snow line, the mountains are covered with the dark evergreen growth of hemlock, spruce, balsam, fir and tall pines, and still further down are interspersed among them the birch, beech, cherry and various other trees, while along the streams are found groves of cottonwood and willow. Over large districts, however, the forest growth is often exceedingly sparse, and even the grass that covers the plains, and upon which travelers depend for the sustenance for their animals, is parched and disappears in the long droughts to which these regions so remote from the sea are subject. In the sandy regions along the North Fork of the Platte River above Laramie River an extraordinary growth of artemisias and other odoriferous plants is found. They abound in the river bottoms and on the hills, growing to the height of two and three feet in tough, twisted, wiry clumps. A multitude of flowering plants abound in this region, among which prevail several of helianthus sunflower, and in the month of September, when they are mostly in bloom, the whole country resembles a vast garden. On the western slope may be found some of the largest trees in the world, many of them over 2,000 years old. The vast forests of the Northwest yield enormous quantities of timber. Not only is there a great variety and amount of plant life, but the vegetation attains a remarkable size. The shrub of the Atlantic region becomes a tall tree on the Pacific Slope. Like the mountains themselves, the vegetation which covers the western slope is large, massive, dense and in every way seems patterned on a gigantic scale.

Fauna.—For several generations the Rocky Mountains have been the world's "sportmen's paradise," vying with India and central Africa. The hunters of big game found great attractions in its grizzlies, buffalo (bison), moose, caribou, not to mention its bighorns and Rocky Mountain goats. Its buffaloes and its beavers have become extinct through excessive depredations and, as early as 1905, James Outram wrote: "The Canadian Rocky Mountains are not remarkable for a great profusion of animal life, though big game in abundance will reward the skillful hunter, provided he is accompanied by a guide who is acquainted with the habitats of the noble denizens of these grand mountain haunts. But unless hunting or research into their ways is the specific object, few animals are likely to be seen. They are too shy and wary . . . to allow human beings to get very close." He tells us that mule-deer caribou are found in the valleys and on the slopes, and fur animals are fairly plentiful; bear "in considerable quantities."

One of the most interesting and unique of the fauna of this great mountain range is the Rocky Mountain goat, or white goat (*Oreamnus montanus*), of the family Bovidae. Its white color (tinged with yellow) is its distinction, being like no other ruminant (except Alaskan wild sheep), remaining entirely white the year round. Its hair is long and pendent in winter, becoming comparatively short in summer; muzzle is hairy, tail short. Its rather short black horns are ringed in basal portion and they taper sharply. A strange huge hump is on the withers where it attains a height of three feet. While at a height of from 2,000 to 5,000 feet above sea-level the region is very arid and affords chiefly desert and alpine forms and the different zones otherwise have their characteristic species. These ranges of habitat are not sufficiently defined to permit their special allocations here.

Mammalia.—Greatest and most formidable of the ferocious beasts of the Rockies is the grizzly bear (*Ursus horribilis*), but indigenous also are the "silvertip," the black bear (*Ursus americanus*), the brown and the cinnamon. Here are the prong-horned antelope (*Antilocapra*), the mountain goat (*Aplocerus*), the Rocky Mountain sheep or "bighorns" (*Ovis montana*) with their great spiral horns; they are the only American wild sheep. To the mammalia belong the lynx, coyote, wolverine, muskrat and marten, the porcupine, red-squirrel with bushy tail and bright striped coat, the gopher. The "whistling" marmot (*Arctomys*) and the prairie-dog (*Cynomys*), a rodent, make themselves audible here and the pikas or "calling" hares (*Lagomys princeps*). Other rodents are the lemming mouse (*Synaptomys cooperi*) and the jumping mouse (*Zapus kudsonius*). Better known to the public are the raccoon (*Procyon*), flying squirrel (*Sciuropterus*), ground squirrel (*Tamias*). The pouched marmot (*Spermophilus*) and the glutton (*Gulo*) are found here.

Birds.—There are many migratory birds, but of those resident there are a dipper (*Sinclus*); *Salpinctus*, one of the wrens; *Poospiza*, *Calamospiza*, genera of finches, including the grosbeak; Rocky Mountain thrush, *Hylocichla guttata audoboni*; *Picicorvus* and *Gymnokitta*, genera of the crow family; *Centrocercus* and *Pediocetes*, genera of the grouse (the grouse are locally termed "fool-hens"); blue-bird *Sialis-arctica*; creeper, *Certhia montana*, downy woodchuck, *Dryobates pubescens*; garrot, *Clangula islantica*; hairy woodpecker, *Dryobates monticola*; jay, *Cyanocitta canadensis*, locally termed "whiskey John" or "whiskey Jack" from the Indian word *ouis-cachon*; pine grosbeak or pine bullfinch, *Pina enucleator montana*; the screech-owl, *Megascops americana maxwellii*. Of winter immigrants from the north are *Leucosticte* and *Plectrophanes*, genera of finches; *Perisoreus*, genus of crow family; *Picoides*, arctic woodpecker; *Lagopus leucurus*, or white-tailed ptarmigan. Summer migrants are *Oreoscoptes*, genus of thrushes; *Campylorhynchus* and *Catherpes*, wrens; *Paroides*, one of the tits; *Phænopepla*, allied to the wax-wing; *Embernagra* and *Spermophila*, genera of finches; *Pyrocephalus*, one of the tyrant shrikes; *Callipepla* and *Cyrtonyx*, American partridges; also *Harporhynchus*, *Lophophanes*, *Carpodacus*.

Spizella. Two kinds of humming birds occur: the *Atthis* and *Selasphorus*.

Reptiles, Amphibia and Fishes.—A number of snakes and lizards. Of lizards there are *Iguanida*, *Gekkotida*, *Svinida* and *Zonurida*. Of snakes there are *Calamariida*, *Calubrida* and *Crotalida*. Among amphibia are *Siredon* (salamander); one of the *Proteida* is peculiar. Abundance of fish is found in the glacial streams and lakes, largely rainbow trout (*Salmo purpuratus*) weighing as high as six pounds and fine eating.

History.—The natural history of a region is told by the geology and physical geography. This region is not as old as the Appalachian. The form of the peaks and the irregular surface of the slopes differ. The missionary explorers visited the mountainous sections of Mexico and the southwestern part of the United States in the 17th century, but the 'Relations of the Franciscans' have as yet (1904) been only partially translated. A large part of our knowledge of this section came first from the reports of the government explorations made by Lewis and Clark in 1804. Other explorations were made by Harmann, Long, Schoolcraft, Bonneville, Nicollet, and Frémont (q.v.). Since 1844 more than 20 expeditions have been engaged in exploring these wild regions, nearly all of them for the United States government. Since the bill and appropriations of March 1853 the object of most of them has been the determination of the most practicable route for a railroad from the valley of the Mississippi to the Pacific. The history of the railroads across these mountains is largely a history of this region. The story of the strange, weird people called Cliff Dwellers (q.v.) is a most interesting chapter in the history of the efforts of man to use this region for a home. At present the population of this whole section is small. A large portion has less than two inhabitants to the square mile. About one-tenth of the whole Rocky Mountain area in the United States has from two to six inhabitants to the square mile; in some places in California, Oregon and Washington there are from six to eight; near the cities from 18 to 45, and in the San Francisco section from 45 to 90.

graphical and Geological Survey of the Rocky Mountains (Washington 1868 et seq.).

ROCOCO, rō-kō'kō, or **ROCAILLE**, rō-kāl-ē, in architecture a name given to the debased style of decoration which succeeded the first revival of Italian architecture. The ornamentation consists of panels with their moldings broken or curved at the angles and filled with rock-work, leafage, shell-work, musical instruments, marks, etc. This style prevailed in Germany and Belgium during the 18th century and in France from the time of Henry IV to the Revolution. In departing from simplicity the true principles of decoration were violated, hence the bizarre character of this decoration soon failed to please.

ROD, rōd, Edouard, Swiss author: b. Nyon, Canton Vaud, 31 March 1857; d. 29 Jan. 1910. He studied at Lausanne and Berlin, became editor of the *Revue Contemporaine* at Paris, succeeded Monnier in the chair of comparative literature at Geneva, but subsequently returned to Paris and became a collaborator on the *Correspondent*, the *Revue des Deux Mondes* and other periodicals. Among his works are 'La course à la mort' (1886); 'Les trois cœurs' (1890); 'Le silence' (1894); 'Scenes de la vie suisse' (1896); 'Au milieu du chemin' (1900); 'Dante' (1891); 'Stendhal' (1892), and 'Essais sur Goethe' (1898). Rod has visited the United States as lecturer before the Cercle Français de Harvard. Consult Stephens, W., 'French Novelists of To-day' (1914).

ROD, called also a pole, or perch, a measure of length, equivalent to five and one-half yards or 16½ feet. See PERCH; WEIGHTS AND MEASURES.

RODBERTUS, Johann Karl, yō'hān kārī rōd-bēr'toos, German political economist: b. Griefswald, 12 Aug. 1805; d. Jagetzow, 6 Dec. 1875. In 1829-32 he was in the Prussian civil service. In 1848 he entered his brief political career as a member of the Prussian National Assembly. Then he was for a fortnight Minister of Education, and in January 1849 entered the second chamber from Berlin. Rodbertus was the real founder of scientific socialism in Germany. In contradistinction to Marx (q.v.), above whom he is placed by many modern economists, he was not international nor material in his views, but a nationalist and idealist, and expected social questions to be solved by legal methods. Professor Wagner has called him "the most distinguished theorist of the purely economic side of scientific socialism." He wrote several works in connection with his propaganda. Consult the lives by Dietzel (1886-87) and Jentsch (1899).

RODD, Sir Rennell, English diplomat, author and poet: b. 1858. As consul-general at Zanzibar in 1897 during the insurrection he took an active part in the fighting. In 1897, as Lord Cromer's lieutenant, he headed a mission to the Emperor Menelik of Abyssinia and later was appointed Minister to Sweden. In 1908 he was sent as British Ambassador to Rome, which post he still held in 1918. Among his writings are a 'Life' of Sir Walter Raleigh and a book upon the ancient crusading princes of Achaia in Greece.

RODDICK, Sir Thomas George, Canadian physician: b. 31 July 1846. He was educated at McGill University, engaged in practice at Montreal and became surgeon at the General Hospital there in 1874. He was consulting surgeon to the Royal Victoria Hospital and a governor of McGill University, where he was connected with the faculty from 1872, and filled the chair of surgery in 1890-1907. He was dean of the faculty in 1901-08. He served in the Fenian Raid in 1870 and in the North West Rebellion of 1885 he organized and was in charge of the medical field forces. He was a member of the Canadian Parliament in 1896-1904, and was knighted in 1914.

RODENBERG, rō'dēn-bērg, Julius, German poet: b. Rodenberg, Hesse-Nassau, 26 June 1831; d. 1914. Of a Jewish family of the name of Levy, he adopted the name of his birthplace for his own. He was educated at the universities of Heidelberg, Göttingen and Berlin, afterward devoting himself to literature and traveling, and for many years after 1874 was editor of the *Deutsche Rundschau*. His publications include 'Journalistic Life in London' (1859); 'Pictures of Berlin Life' (1885-88); fiction, 'The New Deluge' (1865); 'The Granddier' (1878), etc.

RODENBOUGH, ro'dēn-bow, Theophilus Francis, American army officer: b. Easton, Pa., 5 Nov. 1838; d. 19 Dec. 1912. He was educated at Lafayette College, and in 1861 was appointed second lieutenant in the United States army. In the Peninsular campaign of 1862 he was captured at Manassas, but was soon exchanged, and at the battle of Gettysburg was in command of a regiment. He was engaged at Winchester, losing an arm in that battle, and was brevetted major for his bravery. In 1865 he was brevetted brigadier-general of volunteers, mustered out of the volunteer service and was appointed major in the regular army. In 1870 he was retired with full rank as colonel. He was secretary of the Military Service Institution in 1879, its vice-president in 1890-91, assistant inspector-general of New York in 1880-83, and in 1890-1901 chief of the bureau of elections in New York. He has written 'From Everglade to Cañon with the Second Dragoons' (1875); 'Afghanistan and the Anglo-Russian Dispute' (1886); 'Uncle Sam's Medal of Honor' (1887); 'Sabre and Bayonet' (1897). He was editor of 'The Army of the United States' (1896); 'Journal of the Military Service Institution' (1899).

RODENTIA, or GLIRES, an extensive order of Mammalia, represented by such forms as mice, beavers, porcupines, squirrels, rabbits, lemmings, etc. Of the characteristics tooth structures are the most important. The canines are always absent and the incisors large and chisel-like and, with the exception of the *Leptorida*, which have four in the upper jaw, never more than a single pair in each jaw. These teeth consist each of a front layer of hard enamel and a posterior part of softer dentine, which ensures a persistent sharp edge, since the more rapid wearing of the softer dentine leaves the harder enamel of the front surface as a chisel-like edge. These teeth continue to grow from persistent pulps throughout life. The incisors are long and curved and each forms a segment of a circle. Between the in-

cisors and the molar teeth a wide interval exists. The molars are few and their crowns may exhibit a variously laminated or tuberculate pattern. This structure of the molars has relation to the motion of the jaws in gnawing, the jaws being so articulated by narrow condyles fitting in longitudinal grooves that they slide backward and forward instead of moving vertically, as in most other animals. The transverse ridges of the molar teeth act, therefore, in opposition to this sliding motion of the jaws. The molars in some cases (as in the beavers) also grow from persistent pulps and possess undivided fangs. There is always a succession of milk and permanent dentitions. The chief chewing muscle is the masseter, which is greatly developed, while the temporal muscle is small. The usual number of toes is five on both feet, but the pollex may be rudimentary or absent, and in the hind feet the number may be reduced to four, as in the hares, or to three, as in the agouti, jerboa, etc. Generally they are all clawed, but sometimes, as in the capybara, have hoof-like terminations. The scapula is narrow and remarkable for the long acromion process, and the clavicles are generally well developed, but may be imperfect or absent, as in the hares and guinea-pig. The femur generally possesses a third trochanter, and the tibia and fibula are distinct or, as in the rats and hares, united. The beaver has the hind feet webbed, to adapt it for its semi-aquatic life. Some rodents have the hind legs of extreme length, as the jerboas. Usually a more or less complete hairy screen extends across the mouth at the narrow region of the palate behind the incisor teeth, thus preventing the entrance into the hinder portion of the mouth of the chips or dust that result from gnawing operations. Many rodents are provided with cheek-pouches for carrying food; usually these open within the mouth, but in the *Geomysidae* they open externally.

The stomach, generally a simple structure, may in some forms, as the lemmings, become quite complex, and its anterior portion, as in beavers, may be provided with glandular appendages. This same portion in the dormouse is glandular and dilated so as to resemble the proventriculus or digestive stomach of birds. A large sacculated cæcum generally exists, and the intestine is usually very long. A gall-bladder is sometimes wanting. The surfaces of the cerebral hemispheres are smooth or destitute of convolutions and, when viewed from above, the cerebellum is seen to be in great part uncovered by the cerebrum. The corpus callosum is well developed. The penis is usually retractile and contains a bone, and the testes normally remain in the abdomen, but descend periodically into the groin at the breeding seasons. The uterus is frequently completely divided into two cornua or horns, each of which opens separately into the vagina. In others the two cornua unite to form a single uterus or womb. The placenta is of the deciduate type and of discoid form. Rodents are extremely prolific. Most species of rodents have characteristic and penetrating odors which arise from scent glands variously located in the vicinity of the anus. The skin, generally covered with hair, is spiny in the porcupines (q.v.), some genera of which group possess prehensile tails. Many of these animals furnish furs of value in commerce.

Extent and Classification.—This is by far

the largest order of mammals, comprising more than 2,000 species. Rodents are found in all parts of the world, but are poorly represented in the Australian region and on Madagascar and are altogether absent from certain oceanic islands. In South America they reach their maximum development. With a very few exceptions, such as the house-rats and the muskrat, they are exclusively herbivorous, and different species subsist upon grains, nuts, barks, roots, herbage, etc. Notwithstanding their great structural similarity the rodents have fitted themselves to the most varied environmental conditions and present many remarkable adaptations and interesting habits. Most of them are terrestrial; many, like the mole-rats, rabbits and prairie marmots, are burrowers; some, as the beaver and muskrat, are aquatic; many squirrels and others are arboreal. They run, leap, climb or, like the flying squirrel and *Anomalurus*, sail through the air on skinny parachutes. Some, as the woodchuck, are solitary; many are gregarious, like the rats and mice, colonial like the rabbit and prairie marmot, or even, like the beaver, form co-operative societies and exhibit wonderful building instincts. Migratory movements of large parties of rodents are not infrequent, the most remarkable of which are the well-known migrations of the lemmings. Although generally of small size, the rodents have gained a dominance both of species and individuals through their great fecundity and their ability to gnaw out a living beyond the reach of most animals. Their wariness and secretiveness have aided no little toward their preservation, though they form the chief subsistence of a host of snakes, birds of prey and small carnivorous mammals. Human interests are affected by these animals in a variety of ways. Some of them furnish food, furs or sport, others are interesting pets, but the great majority are injurious to agricultural interests. No less than 400 species and many additional sub-species have been described as occurring within the limits of North America, the great majority being mice.

The following is a modern classification of the order, through some mammalogists recognize a larger number of families:

Group Simplicidentata.—There is a single pair of upper incisors with the enamel layer confined to the anterior surface; the fibula does not articulate with the calcaneum. Three sub-orders:

I. *Hystricomorpha*, or porcupine-like rodents: tibia and fibula distinct, alveolus of lower incisor ending on the medial side of the ramus of the lower jaw, only one premolar in each jaw: Families: *Octodontidae*, containing the coypu and many others chiefly of South America, but a few in Africa; *Hystricidae*, the porcupines; *Chinchillidae*, chinchillas of South America; *Dasyproctidae*, agoutis, etc., of South America; *Dinomyidae*, containing a single generalized rodent of Peru; *Caviidae*, the cavies or guinea-pigs and capybara of South America.

II. *Sciuromorpha*, or squirrel-like rodents: tibia and fibula distinct from each other, the alveolus of the lower incisor penetrating the ramus of the lower jaw and the premolars one or two on each side above and one on each side below. Families: *Sciuridae*, the squirrels and marmots, found throughout the world except Australia; *Anomaluridae*, peculiar squirrel-like

animals with extensive parachutes along the side found in tropical Africa; *Haplodontidae*, the sewellel or mountain-beaver of the mountains of the north Pacific coast; *Castoridae*, the beavers of the northern hemisphere.

III. *Myomorpha*, or rat-like rodents: tibia and fibula coalesced, lower incisors as in the squirrels, premolar 8 to 4. Families: *Dipodidae*, jumping mice, jerboas, etc. North America, Europe, Asia and Africa; *Muridae*, the rats and mice, a very extensive and cosmopolitan group, variously subdivided; *Myoxidae*, the dormice of Europe and other Old World forms; *Geomyidae*, pouched gophers and pouched mice of America; *Lophiomyidae*, a remarkable arboreal African form; *Spalacidae*, the mole rats and their allies of the Old World.

Group Duplicidentata.—Besides the large incisors, the enamel covering of which extends all around, there is a second pair in the upper jaw; the fibula articulates, with the calcaneum and the ankle and elbow joints are tongued and grooved; tibia and fibula co-ossified. One sub-order: *Lagomorpha*, hare-like rodents, with two families: *Leporidae*, hares and rabbits, cosmopolitan; *Lagomyidae*, picas or whistling hares, North America and Europe.

Fossil Rodentia.—Rodent remains first occur in a fossil state in the Eocene Period, in which remains of forms allied to the dormice, porcupine and squirrels exist. In Pliocene and post-Pliocene formations they become tolerably plentiful. Of the post-Tertiary forms, *Trogotherium*, or the great beaver, found in European deposits, is a familiar species, and the cave beaver (*Castor spelæus*) is also a notable form. *Trogotherium* may possibly have survived the human period. The hares and rabbits first occur as fossils in Lower Miocene of North America and Pliocene of Europe, and the rats and mice are found in Eocene, Miocene and Pliocene formations. The guinea-pigs are chiefly Pleistocene, their remains occurring in the Brazilian bone caves of that age. Some of the extinct rodents were as large as an ox. Very little light has been thrown on the origin of the order by a study of the fossil forms, though Professor Cope believed the Tillodonts to be their ancestors.

Bibliography.—Consult the articles in this work on the various animals included in the order, and the following: Coues and Allen, 'Monographs of North American Rodentia,' United States Geological Survey of Territories (Washington 1877); Elliot, 'Synopsis of the Mammals of North America,' Field Columbian Museum (Chicago 1901); Beddard, 'Mammals' (London 1902); Alton, 'On the Classification of the Order Glires,' Proc. Zoological Society (London 1876); Osborn, 'Age of Mammals' (New York 1910); and numerous papers by Merriam, Miller, Palmer and others in the 'Bulletins' of the Biological Survey of the United States Department of Agriculture.

RODERICK, rōd'ēr-ik (Spanish, *Roderico*). last king of the West Goths in Spain. In 710 he was chosen king. Shortly after the Moors, under Muza, invaded Spain. Roderick met the invaders on the banks of the Guadalete in 711, but was defeated, and perished in the battle. Some accounts declare that he maintained resistance for two years longer. He is the hero of Scott's 'Vision of Don Roderick' (1811).

and Southey's 'Roderick the Goth' (1814). Consult Toiilan, 'Chronique Rimée des Derniers Rois de Tolède' (1885); Dozy, 'Geschichte der Mauren in Spanien' (1874); Saavedra, 'Estudio sobre la invasion de los Arabes' (1895).

RODES, Robert Emmett, American Confederate soldier: b. Lynchburg, Va., 29 March 1829; d. 19 Sept. 1864, in the battle of Opequon (q.v.). He studied at the Virginia Military Institute, where he graduated in 1848 and remained as professor till 1861, when he was commissioned as captain of the Mobile Cadets. In the early stage of the Civil War, he commanded the 5th Alabama Infantry, Ewell's 2d brigade, Army of the Potomac, in the first battle of Bull Run (q.v.). He was severely wounded at Seven Pines and later distinguished himself at Gaines' Mill and South Mountain in 1862. His brigade was in the van at Chancellorsville and for his services he was promoted to major-general on the field. He took part in numerous battles—notably that of the Wilderness (q.v.)—and was one of the most successful of the Southern military leaders.

RODGERS, rō'ērz, Christopher Raymond Perry, American naval officer: b. Brooklyn, N. Y., 14 Nov. 1819; d. Washington, D. C., 8 Jan. 1892. He entered the United States navy as a midshipman in 1833, commanded the schooner *Phanix* in the Seminole War in 1840-41, was engaged in blockading service in the Mexican War and served in the trenches at Vera Cruz and at the capture of Tobasco and Tuspan. He was commissioned commander in 1861, was fleet-captain at the battle of Port Royal and also in the attack on the defenses of Charleston in 1863. He was then appointed to command the steam sloop *Iroquois* and was engaged in special service until the close of the war. He became commodore in 1870 and in 1874 received rank as rear-admiral. He was superintendent of the Naval Academy in 1874-77, in command of the naval forces in the Pacific in 1878-80, and from then until his retirement in 1881 was again superintendent at the academy. He presided over the convention held in Washington in 1885 for fixing a prime meridian and universal day.

RODGERS, Frederick, American admiral: b. Havre de Grace, Md., 3 Oct. 1842. He was graduated at the United States Naval Academy in 1861, receiving his warrant as midshipman in June. He participated in the actions at Donaldsonville, Port Hudson and College Point; and served on the Grand Gulf, Atlantic and West Gulf blockading squadrons in 1863-65. He was promoted lieutenant-commander in 1866 and commander in 1875. He was light-house inspector in 1876-77, 1881-83 and 1887-90, and was promoted captain in 1890. He was supervisor of New York Harbor in 1892-93; commander of the United States ship *Massachusetts* in 1896-97; commanded United States ship *Puritan* during the war with Spain, and became commodore in December 1898. He was president of the Board of Instruction and Survey in 1898-1901, being promoted rear-admiral in 1899. In 1901 he was senior squadron commander of the Asiatic fleet, and in 1902 he was commander-in-chief. He was commander of the navy yard, New York, in

1903-04; and was retired 3 Oct. 1904. He served on special board duty in 1904-07.

RODGERS, John, American naval officer: b. Harford County, Md., 11 July 1771; d. Philadelphia, 1 Aug. 1838. He entered the naval service in 1789, and in 1798, as lieutenant and executive officer of the frigate *Constellation*, captured a French vessel, for which service he was promoted captain in 1799. In 1802 he was appointed to the Mediterranean squadron then engaged in the war with Tripoli, in the success of which he was largely instrumental. He succeeded Commodore Barron in the command of the squadron in 1805, and in this office rendered a valuable diplomatic service in securing treaties from Tripoli and Tunis which established the friendly relations since existing between those countries and the United States. In 1812 Commodore Rodgers, in command of the Atlantic squadron, was the first to fire upon the British, and during the campaign captured some 23 English vessels. He was president of the Board of Naval Commissioners 1815-37, except during the three years 1824-27, when he was again in command of the Mediterranean squadron.

RODGERS, John, American naval officer, son of the preceding: b. Harford County, Md., 8 Aug. 1812; d. Washington, D. C., 5 May 1882. He was commissioned lieutenant in 1840 and was engaged in the hostilities with the Seminoles from 1840 to 1843. Subsequently he performed a valuable service in surveying the Florida coast. His explorations from 1852 to 1861 in the north Pacific and China seas and in the Arctic Ocean were also of much scientific and commercial importance. As commander of the monitors *Weehawken*, *Dictator* and *Monadnock* he took a prominent part in the Civil War. He was made commodore in 1863, and in 1869 commissioned rear-admiral in command of the Asiatic fleet. In this office he rendered valuable service as a diplomat by establishing the safety of American commerce in Korea. At his death he was superintendent of the naval observatory at Washington.

RODIN, rô-dân, (François) Auguste, eminent French sculptor: b. Paris, November 1840; d. 17 Nov. 1917. After working in a subordinate position in several studios he exhibited for the first time in the Salon in 1875, and since then became well known as a sculptor utterly beyond the control of classical convention, and reveling in the first expression of emotion and action, yet showing a power of execution worthy of the best Renaissance art. One of his first productions was 'The Broken Nose,' which invited much discussion. In 1870, during the siege of Paris, he served in the national guard. He has done some remarkable work, as for instance 'The Brazen Age,' exhibited as a cast, and after much discussion executed in bronze for the Luxembourg Gardens. Among other rugged and fantastic creations are 'Burghers of Calais'; 'The Kiss.' He has made busts of Bastien-Lepage, Victor Hugo, Henri Rochefort and Jules Daloux, the sculptor. 'The Hand of God,' 'The Bather,' a bust of 'Saint John,' and 18 minor works, are in the Metropolitan Museum of New York. Originals or copies of his works are to be found in all the great sculpture collections of the globe. Rodin was distinctly an impressionist, seeking to convey a psychologi-

cal meaning to the beholder. He was not satisfied to reproduce a figure; he felt it necessary to present an idea with every piece of carving. He not only conquered the prejudice of convention, which demanded only the beautiful and graceful, according to accepted types, but he set a new standard of modern expression, emphasizing the strength and character even of ugliness, and showing the possibility of emphasizing an idea in stone by exaggeration, as is done by the most expert cartoonist. It was not humor, however, that he strove to display, but rather the grand human emotions. The breadth of Rodin's character is illustrated by his indifference to hostile criticism. No other sculptor of modern times has received so much criticism, nor succeeded in overcoming all criticism. His plaster sketch of Balzac, in a voluminous dressing gown, was declared absurd by the committee of the Society of Men of Letters, and they refused to accept it, giving the order to Falguière. In the salon where his successful opponent exhibited his Balzac, Rodin entered a bronze bust of Falguière, showing that he was above all petty jealousy. Time has shown that he could afford to be, and many devotees of art now declare that he never had a peer. This is doubtless over-enthusiasm. Rodin was a great inspired sculptor, ranking with three or four of the world's best, and he has given birth to a new school. He has been showered with honors, college degrees, official positions in art societies, and was chosen president of the International Society of Sculptors, Painters and Engravers, succeeding Whistler in 1904. At the 1900 Exposition in Paris an entire building was given up to the display of Rodin's works. In addition to his marble and bronze figures were many water-color drawings and etchings. Further illustrating the versatility of his genius are a number of writings on various subjects, of which the most notable is 'Les cathedrales de France' (1914). Consult Marx, 'Auguste Rodin, Ceramiste' (Paris 1907); Lawton, F., 'Life and Work of Auguste Rodin' (New York 1907); Dirks, R., 'Auguste Rodin' (Paris 1913); Bulletin, Metropolitan Museum of Art, *Supplement* (New York, May 1912); Harris, F., 'Contemporary Portraits' (New York 1915).

RODMAN, Hugh, American naval officer: b. Frankfort, Ky., 6 Jan. 1859. In 1880 he was graduated at the Naval Academy of the United States and at the Naval War College in 1907. In 1883 he was promoted ensign, junior grade; became ensign in the following year and was made lieutenant, junior grade, in 1893. In 1903 he was commissioned lieutenant-commander; commander in 1907; captain in 1911, and rear-admiral on 23 May 1917. In the Spanish-American War he served on the *Raleigh*; was executive officer of the *New Orleans* in 1904; on the *Cincinnati* in 1904-05; the *Wisconsin* 1905, etc. In 1907-08 Rodman was inspector in charge of the sixth lighthouse district; commanded the *Cleveland* in 1909-10; served as inspection officer at the Mare Island navy yard 1910-11; commander of the *Connecticut* in 1912; the *Delaware* in 1912-13, and in 1914-15 was superintendent of transportation of the Panama Canal. In 1915-16 he commanded the *New York* and the following year

served as member of the General Board of the Navy Department. In 1917 Rodman was made commander of Division Three of the Atlantic Fleet and later in the same year became commander of squadron I of the Battleship Force of the Atlantic Fleet; subsequently he commanded Division Three of Battleship Force One of the same fleet and in November 1917 was made commander of Division Nine of the Battleship Force for duty with the British Grand Fleet. In April 1918 Rear-admiral Rodman was made commander of the battleship divisions of the navy. He was awarded medals for his part in the battle of Manila Bay, 1 May 1898, and also for his efficiency in other actions during the Spanish-American War.

RODMAN, Isaac Peace, American soldier: b. South Kingston, R. I., 18 Aug. 1822; d. Sharpsburg, Md., 30 Sept. 1862. He engaged in business as a woolen manufacturer, served several terms in the Rhode Island legislature and in 1861 resigned his seat in the State senate, organized a company, of which he was commissioned captain, and went to the front. He was promoted lieutenant-colonel for gallantry at the first battle of Bull Run, fought at Roanoke Island and at New Berne, N. C., and in 1862 was commissioned brigadier-general of volunteers. He commanded a division at Antietam in 1862 and while leading a charge was mortally wounded.

RODMAN, Thomas Jefferson, American military officer: b. Salem, Ind., 30 July 1815; d. 7 June 1871. He was graduated from the ordnance department of West Point in 1841 and was appointed to service at various arsenals, where his experiments in the manufacture of guns soon brought him into prominence. His method of casting guns on a hollow core, the metal being cooled by a stream of water running through the inside, was adopted in 1847. This method he later applied to shells and cannon. In 1860 he completed his experiments upon a 15-inch gun for the uses of mammoth powder, the cannon which bears his name. The Rodman gun and mammoth powder were adopted by the United States government in the following year, and soon after by Russia, England and Prussia. In 1865 he was brevetted brigadier-general, and four years before his death promoted to the rank of lieutenant-colonel.

RODMAN, William Lewis, American surgeon: b. Frankfort, Ky., 7 Sept. 1858; d. 8 March 1918. He was graduated at the Kentucky Military Institute in 1875 and took his M.D. at Jefferson Medical College, Philadelphia, in 1879. He was a surgeon in the United States army in 1880-82; then engaged in practice at Louisville, Ky., where he was demonstrator of surgery in the medical department of the University of Louisville in 1885-93. He was professor of surgery at the Kentucky School of Medicine in 1893-98; and thereafter held the chair of surgery at the Medico-Chirurgical College of Pennsylvania, and was also professor of surgery and clinical surgeon of the Women's Medical College of Pennsylvania from 1900. He wrote 'Diseases of the Breast' (1908).

RODMAN GUN. See GUNS, HISTORY AND DEVELOPMENT.

RODNEY, rōd'nī, Caesar, American patriot: b. Dover, Del., 7 Oct. 1728; d. there, 29 June 1784. He was the grandson of William Rodney, a large landholder under the Duke of York, in the grant to William Penn, and member of Penn's council. As high sheriff of Kent County and judge of all the lower courts of the province of Delaware, Caesar Rodney came into prominence as a statesman. He was a delegate to the Stamp Act Congress held in New York in 1765, and as speaker of that body was largely instrumental in bringing about the first Continental Congress, of which he was also a member. In this capacity he was one of the signers of the Declaration of Independence. In 1775, after the second session of the Congress at Philadelphia, he journeyed through his native province sowing the seed of independence, and was appointed brigadier-general in the army under Washington at the beginning of the Revolution. As commander of the Delaware militia he rendered valuable service, for which he was made a major-general in 1777. In this year also he was made president of the State of Delaware, from which office he retired in 1782.

RODNEY, Caesar Augustus, American statesman, son of Caesar Rodney (q.v.): b. Dover, Del., 4 Jan. 1772; d. Buenos Aires, Argentina, 10 June 1824. He was graduated from the University of Pennsylvania in 1789 and after his admission to the bar in 1793 practised law in Wilmington, Del. On account of his election to Congress as an anti-Federalist in 1805 he has been called the first Democrat in that body. In 1807 he was appointed Attorney-General of the United States by President Jefferson, but resigned this office in 1811, and in the War of 1812 took active part on the Canadian frontier as captain of artillery. In 1821 he again represented Delaware in Congress, and in the following year took his seat in the United States Senate. In 1823 he was appointed Minister Plenipotentiary to the Argentine provinces.

RODNEY, George Brydges, 1st BARON RODNEY, English naval commander: b. Walton-upon-Thames, and baptized 13 Feb. 1718; d. London, 23 May 1792. He became a lieutenant in 1739, first obtained a ship in 1742 and in 1748 went to Newfoundland as governor. On his return in 1751 he was elected member of Parliament. In 1759 he was promoted rear-admiral, and in 1761 sailed to the West Indies, reduced Martinique and took possession of Saint Lucia, Grenada and Saint Vincent. In 1762 he became vice-admiral and in 1764 was made a baronet. The next year he became governor of Greenwich Hospital. In 1779, having already been promoted to the rank of admiral, he was put in command of a fleet bound for the West Indies with instructions to relieve Gibraltar on his way. This latter was accomplished on 16 Jan. 1780 by capturing or destroying seven ships of the fleet of the Spanish admiral, Don Juan de Langara. Continuing on to the West Indies he encountered the French fleet under Guichen near Martinique, with indecisive results, though with considerable loss on both sides. In April 1782, he again met a French fleet in the West Indies, this time commanded by Count de Grasse; and after a three days' fight overcame the French, captured de Grasse and his

flagship, the *Ville de Paris*, but forewent the larger part of his spoil by not giving chase. Before the news of the victory reached England, Admiral Hugh Pigot had been sent to supersede Rodney, and though he retired from active service, he was rewarded with a pension and a barony. Consult Mundy, 'Life and Correspondence of Lord Rodney' (1830); Hannay, 'Rodney' ('English Men of Action').

RODRIGUEZ, José Ignacio, Cuban-American lawyer and author: b. Havana, Cuba, 11 Nov. 1831; d. Washington, D. C., 1 Feb. 1907. He was educated at the University of Havana and studied American law under Caleb Cushing. In 1855 he was admitted to the bar at Havana and in the same year was appointed supernumerary professor of philosophy at the university there. In 1856 he became professor of natural philosophy and chemistry at the Preparatory Technical School of Havana; in 1863 professor of natural philosophy and chemistry, Havana Institute; in 1864 judge of the Belén district, and in 1866 inspector-general and member of the superior board of public instruction. In 1869 he removed to the United States and in 1890 was secretary to the International American Conference and in 1891 secretary to the International American Monetary Commission. At Paris in 1898 Dr. Rodríguez acted as private adviser in matters of Spanish law to the American Peace Commission. In 1902-03 he was secretary to the United States delegation to the Pan-American Conference at Mexico City. He was at one time chief translator and head of the Spanish department of the International Bureau of American Republics and at the time of his death was chief translator and librarian of the Columbus Memorial Library. He published 'Vida de Don José de la Luz y Caballero' (1874); 'Vida del Presbítero Don Félix Varela' (1878); 'Estudio histórico sobre el origen, desenvolvimiento y manifestaciones prácticas de la idea de la anexión de Cuba á los Estados Unidos de America' (1901), and contributions to the 'Catholic Encyclopedia,' *The Forum*, *American Catholic Quarterly Review*, etc.

RODRIGUEZ, rod-ré'gēs, a volcanic island in the Indian Ocean, 19° 41' S. and 63° 23' E., about 345 miles east by north of Mauritius (q.v.), of which it is a dependency, and connected by cable telegraph. It is 13 miles long by six miles wide, and the altitude is about 1,750 feet. It is surrounded by a coral reef. Its isolation has prevented change in its flora and fauna, and for this reason the island has been of interest to the botanist and the zoologist. It is very fertile and tropical fruits flourish, also sugar-cane, cotton, coffee and tobacco. The only indigenous animal is a fruit-eating cat, but deer and fowl were once abundant. Until near the end of the 17th century the dodo-like solitaire, now an extinct bird, was found on this island. The population is about 4,000, mostly negroid. The government maintains a hospital and school and retains a priest. The island was discovered by the Portuguese in 1645 and since 1810 it has been a British colony. Consult 'Reports' of the Transit of Venus Expedition in 'Philosophical Transactions' (London 1879).

RODRÍGUEZ Y FERNÁNDEZ, Teodoro, Spanish educator and author: b. Santiago Millas, León, 8 Nev. 1864. He was edu-

cated at Astorga Seminary, the Augustinian scholasticate, Valladolid, College of La Vid, Burgos, Escorial University, Ximenes Institute and Central University, Madrid. In 1879 he entered the Augustinian order and was ordained to the priesthood in 1887. He was successively vice-rector, professor and rector of Escorial University and president of the Catholic Social Bureau of the Escorial. At present he is provincial of the Sacred Heart province of his order and moral instructor to Don Alfonso de Bourbon. In 1911 Dr. Rodríguez took an active part in the assembly which presented resolutions on the laws of education to the minister of public instruction. He founded the charitable Social Bureau of the Escorial, which maintains a night school for workmen, savings banks, loan offices, a department of domestic economy and fund for providing dowries. He has published 'Elementos de física y química'; 'Elementos de química'; 'La enseñanza en España'; 'Estudios sociales' (2 vols.); 'Lecturas sociales'; 'Problemas científico-religiosos'; 'La paz del alma'; 'Ricos y pobres'; 'Misión social de las clases cultas y acomodadas'; 'El deber social'; 'Sindicalismo y Cristianismo'; 'La civilización moderna'; etc.

RÓDRIGUEZ DE FONSECA, Juan. See FONSECA, JUAN RÓDRIGUEZ.

RÓDRIGUEZ GALVÁN, rōd-rē'gās gāl-vān', Ignacio, Mexican poet and dramatist: b. 1816; d. 1842. Although he died at the early age of 26 he had already proved himself one of the greatest dramatic and poetic geniuses of Mexico and one of the masters of the Spanish tongue. Early in the beginning of the last century Mariano Galván had a noted bookstore in Mexico City and he published the *Galvan Callender*, which is still issued. His young nephew Ignacio came to work for him. The boy had very little education; but he set to work to educate himself through the books in his uncle's store and with the help of kindly priests and other visitors to the old book shop. In this way he mastered several languages, while yet in his 'teens. But above all he studied poetry and more especially the works of the romantic poets who had already begun to make a stir in the world of literature. Young Rodríguez Galván early began to write in imitation of his favorite authors, poetry and drama. In 1838 when he was but 22 years of age, his first drama was produced in Mexico City with great success. This drama, 'Muñoz, Visitador de Mexico,' which was based on events in Mexican history of the colonial period, was the first real national drama in Mexico; and it set the fashion for others, many of them of notable worth. It is a tragedy in which all the principal characters suffer in the usual way of the romantic school. But it has many strong qualities which has ever made it a favorite in Mexico and in Spain, where it has been frequently produced. Rodríguez Galván's bent of mind was tragic and his odes and poems, though forceful and poetic, are all tinged with this tragic hue. The young poet also set the fashion of going into the pre-Conquest history of Mexico for subjects, in the 'Visión de Moctezuma.' This legend was written about a tradition of the unfortunate emperor of Mexico who occupied the throne of the Aztecs at the time of the Conquest. The poet also went

back into the same period for the incidents in 'La Profecía de Guatemoc,' the last emperor of the Aztecs. In this poem he again sounds a very strongly national note, when he presents the dead emperor, in a vision, showing his burnt feet, as a token of the cruelty of the Spaniards who had tortured him in an effort to force him to reveal the hiding place of a royal treasure which he was supposed to have hidden. This latter poem was followed by a second drama dealing with an incident of the colonial period of Mexican history and entitled 'El Privado del Virrey,' which was still more popular than his first effort in this field; and awakened the people of the capital to the fact that in this young man had arisen a national drama and poetry. His literary reputation secured for Rodríguez Gaván an appointment in the Mexican diplomatic service in South America. At that time yellow fever was raging in Vera Cruz; Galván succumbed and died at Havana, on the threshold of what promised to be a much greater fame than he had as yet achieved. Young though he was at the time of his death his youthful accomplishments have won for him the title of father of the Mexican national drama and of Mexican romantic poetry of the purely national type. In reality he is the first of the romantic poets of Latin America and his work has had considerable influence upon that of other Latin-American poets in Central and South America.

ROE, Charles Francia, American soldier: b. New York, 1 May 1848. He was graduated at West Point in 1868 and entered the 1st cavalry, being assigned to frontier duty. In 1870 he was transferred to the 2d cavalry; became second lieutenant in 1871 and first lieutenant in 1880. In his early days in the West he rode 22½ hours from Camp Harney, Ore., to Fort Bidwell, Cal., to carry orders to prevent an Indian outbreak. In 1888 he resigned from the army and engaged in real estate business in New York. He became major of Troop A, New York Volunteer Cavalry, in 1895, and later was appointed major-general. President McKinley appointed him brigadier-general of United States volunteers in June 1898; he retired on account of his advanced age on 1 May 1912.

ROE, Edward Payson, American Presbyterian clergyman and novelist: b. Moodna, New Windsor, Orange County, N. Y., 7 March 1838; d. Cornwall, N. Y., 19 July 1888. He studied at Williams College and at Auburn and Union Theological seminaries; was ordained to the Presbyterian ministry; in 1862-65 was a chaplain in the volunteer service; and from 1865 until his resignation in 1874 held a Presbyterian pastorate at Highland Falls, N. Y. There his addresses on topics of the Civil War gained for him some notice as a speaker. In 1874 he removed to Cornwall-on-Hudson, N. Y., where he cultivated small fruits and turned out a series of novels which sold largely (759,000 copies, it was estimated, at his death) and met with widespread interest but lacked distinction or literary quality. Among the titles are 'Barriers Burned Away' (1872); 'Opening a Chestnut Burr' (1874); 'A Knight of the 19th Century' (1877); 'A Face Illumined' (1878); 'Driven Back to Eden' (1885); and 'The Earth Trembled' (1887). He published also three books on horticulture. Consult 'E. P.

Roe: 'Reminiscences of his Life,' by his sister, May Roe (1899).

ROE, Francis Asbury, American naval officer: b. Elmira, N. Y., 4 Oct. 1823; d. Washington, D. C., 28 Dec. 1901. He entered the naval service in 1841 as acting midshipman on the *John Adams* and received his later training at the Naval Academy at Annapolis and in service in various parts of the world. He was executive officer of the flagship *Vincennes* during the Arctic exploring expedition of 1855, and was made a lieutenant in that year. At the outbreak of the Civil War he was appointed executive officer of the *Pensacola*, which was in the van of Farragut's fleet, and was especially commended for bravery during the famous passage of Fort Jackson and Fort Saint Philip. In 1862 he was ordered to the gunboat *Katahdin* and upon the first day of his command fought the battle of Baton Rouge. For this service he was promoted to the rank of lieutenant-commander. On 5 May 1864, in command of the *Sassacus*, he defeated the Confederate ram *Albemarle* and the gunboat *Bombshell* near Plymouth, N. C. As commander of the Gulf Division of Rear-Admiral Palmer's squadron at Vera Cruz he rendered noteworthy service as negotiator between the forces of General Juarez and the governor of Vera Cruz, and received the surrender of that city in 1867. From 1869 to 1871 he was with the Asiatic fleet and was commissioned captain in 1872. In 1884 he was promoted rear-admiral and was retired the following year.

ROE, John Orlando, American laryngologist: b. Patchogue, L. I., 3 Feb. 1849; d. 24 Dec. 1915. He was graduated M.D. at the University of Michigan in 1870 and later studied at the College of Physicians and Surgeons, New York. He engaged in practice at Rochester, N. Y., and specialized in laryngology, rhinology and otology, in which fields he made extensive researches and originated several valuable operations. He wrote 'Recurrent Papilloma of the Pharynx' in 'Illustrated Medicine and Surgery' (1884); 'Foreign Bodies in the Larynx and Trachea' and 'Foreign Bodies in the Pharynx and Esophagus' in 'System of Diseases of the Ear, Nose and Throat' (1893); 'Injuries and Deformities of the Nose and Throat' and 'Operations in the Upper Air Passages' in 'American Textbook of Diseases of the Eye, Ear and Throat' (1899), etc.

ROE, Richard. See **DOE, JOHN.**

ROE-DEER, a small European deer (*Capreolus caprea*), the adult measuring about two feet at the shoulders and about two and one-half feet at the hind quarters. The buck's antlers are small, and provided with three short branches only. The general body-color is a brown. The tail has a white patch at its root and the chin, belly and inner aspects of the limbs are grayish-white. These animals inhabit mountainous districts, and are monogamous, each male remaining faithful throughout life to one female. The habits of the roe are somewhat like those of the goat, or even of the chamois. It keeps its footing on rocks with great security, bounds very actively, and takes great leaps. Its usual pace, when not very hard pressed, is, however, a kind of canter. It is not gregarious, not more than a buck and doe

with one or two fawns being usually seen together. The voice of the roe-deer resembles that of a sheep, but is shorter and more barking. The roe browses on the tender shoots of trees and bushes as well as on herbage, and is thus very injurious to young woods. It is never very thoroughly tamed, and when kept in parks is apt to become mischievous, and the male dangerous. The venison is superior to that of the stag, but not equal to that of the fallow deer. The horns are used for handles of carving knives and similar articles.

ROEBLING, reb'ling, John Augustus, famous American bridge-builder: b. Mühlhausen, Prussia, 12 June 1806; d. Brooklyn, 22 July 1869. He was graduated at the Royal Polytechnic School in Berlin in 1826, his thesis being on suspension bridges. He came to America in 1831 and settled in Pittsburgh, Pa. Later he was engaged in surveying the lines of the Pennsylvania Railroad across the Allegheny Mountains from Harrisburg to Pittsburgh. Having spent some years thereafter in the manufacture of iron and steel wire he utilized his new product in 1844-45 in building an aqueduct across the Allegheny River at Pittsburgh, consisting of a wooden trunk supported by wire cables. The bridge comprised seven spans each 162 feet long. In 1846 he built a suspension bridge over the Monongahela River at Pittsburgh, and after building several other bridges removed his business to Trenton, N. J., and in 1851 began the construction of the suspension bridge across Niagara River, connecting the New York Central and the Canadian Railway systems. He next built the bridge over the Allegheny River at Pittsburgh and during 1856-67 the bridge connecting Cincinnati and Covington. In 1868 he was chosen chief engineer for the construction of the Brooklyn Bridge; but he died the following year from the effects of an injury to one of his feet. The completion of the structure was carried out by his son. He was the author of 'Long and Short Span Railway Bridges' (1869).

ROEBLING, Washington Augustus, American civil engineer: b. Saxenburg, Pa., 26 May 1837. He was graduated at the Rensselaer Polytechnic Institute, Troy N. Y., in 1857, and joined his father, John A. Roebling (q.v.), in the construction of the suspension bridge across the Allegheny River at Pittsburgh. He served in the Union army, 1861-65; was brevetted lieutenant-colonel in December 1864 for gallant service before Richmond and colonel of volunteers in March 1865 for meritorious service during the war. He joined his father in building the Cincinnati-Covington suspension bridge and became assistant engineer in constructing the Brooklyn bridge. After his father's death in 1869 the entire direction of the work was left in his hands. He found it best to strengthen the design, increasing the anchorages. This was far the largest suspension bridge ever attempted at that date, and he felt the responsibility so strongly and worked so exhaustively that his health broke down, though he continued the supervision from his bedroom, until the bridge was completed in 1883. Since that date he has been engaged as vice-president of the iron and steel wire and wire rope manufacturing concern of John A. Roebling and Sons Company of Trenton, N. J.

ROEBLINGITE, a white, massive mineral, recently found at Franklin Furnace, N. J., having the remarkable composition $H_{10}Ca_7Pb_2Si_3S_{10}O_{48}$, which is interpreted by Penfield as being a combination of five molecules of the silicate H_2CaSiO_4 with two molecules of the basic sulphite, $CaPbSO_3$. This is the only known occurrence of a sulphite in nature. Named after W. A. Roebling.

ROEBUCK, rō'būk, John Arthur, English politician: b. Madras, India, 29 Dec. 1802; d. London, England, 30 Nov. 1879. He was called to the bar in 1831. In 1832-37 and in 1841-47 sat in Parliament for Bath and for Sheffield in 1849-68, and again from 1874 until his death. He charged the Aberdeen ministry with mismanagement of the Crimean War, and was instrumental in overthrowing it; he favored the Confederacy in the United States, and supported Beaconsfield in his Eastern policy in 1877-78. In 1879 he became a member of the Privy Council. He wrote 'Colonies of England' (1849); 'History of the Whig Ministry of 1830' (1852), etc.

ROEDIGER, rê'dig-ēr, Emil, German Orientalist: b. Sangerhausen, Thuringia, 13 Oct. 1801; d. Berlin, 15 June 1874. He studied at Halle, where in 1830 he became extraordinary and in 1835 ordinary professor of Oriental languages. He removed to a similar post in Berlin in 1860 and remained there until his death. He continued the work of Gesenius' 'Novus Thesaurus Philologicus Criticus Linguae Hebraicae et Chaldaee Veteris Testamenti, Editio ii' with indexes, additions and corrections (1858). He edited Gesenius' 'Hebrew Grammar,' and wrote 'De Origine et Indole Arabicae Librorum V. T. Historicorum Interpretationis Libri Duo' (1829).

ROELAS, rō-s'las, Juan de las (El CLÉRIGO ROELAS), Spanish painter: b. Seville, about 1558; d. Olivárez, 26 April 1625. He received a university education, and studied painting in Venice, where his work was influenced materially by Titian and by Tintoretto, more particularly by the latter. He was especially strong as a draughtsman and his work is marked by great vigor and power and by splendid color effects. He was appointed prebendary of the chapel at Olivárez in 1603, but lived and worked in Madrid and Seville until 1624, when he removed to Olivárez. His works are listed by Cean Bermudez. Among them are 'Death of Saint Isidore' (Church of San Isidore, Seville); 'Martyrdom of Saint Andrew' (Seville Museum); 'Santiago at Battle of Clavigo' (Cathedral of Seville); 'Moses Striking the Rock' (Madrid Museum); 'Conception' (Dresden Gallery); 'Communion of Saint Theresa' (Hermitage, Petrograd).

ROELOFS, rê'lōfs, Willem, Dutch painter and naturalist: b. Amsterdam, 10 March 1822; d. 1897. He early made his home in Utrecht, where he learned to appreciate the beauty of the Netherlands landscape. In 1845 he began his art career in The Hague, and three years later went to Brussels, thus completing his studies of the Dutch masters. From Belgium he passed to France and received the great artistic impulse of his life from the French landscape painters, who represent the aspects of nature as interpretative of spiritual moods. Thus he learned

to depict what we may style the transitions of color and light in scenery with a certain dramatic intensity, and preferred the portrayal of dazzling light effects and violent contrasts in color; as when the sunlight pours like a torrent through gaps of leafage into the dark forest depths. He traveled through the whole of Holland and gathered subjects and *motifs* for his pictures from many obscure and unfamiliar spots, painting with equal facility in oil and water color. He was also a skilful etcher. As a naturalist he was well known among students of entomology.

ROENTGEN, rēnt'gēn, Wilhelm Konrad, German physicist: b. Lennep, Prussia, 27 March 1845. He took his Ph.D. at Zürich in 1869, and later became assistant to Kuntz at Würzburg. He was professor at Hohenheim, Strassburg and Giessen, and in 1885 became professor of physics and director of the physical laboratory at Würzburg. In 1895 he discovered the rays known by his name (see X-RAY), and which made him famous. He was awarded the Rumford Medal of the Royal Society, London, in 1896; the Barnard Medal of Columbia University in 1900; and the Nobel Prize in physics in 1901. From 1899 he was professor of experimental physics at Munich. He is the author of 'Annalen der Physik und Chemie,' embodying the results of numerous experimental labors.

ROGATION DAYS, the Monday, Tuesday and Wednesday next before Ascension Day: so-called because they are observed as days of solemn supplication, with processions and chanting of the Litanies (Greek *litaneia*, supplication; equivalent to Latin *rogatio*). The custom of processions on these days had its rise in the city of Vienne in Gaul about the middle of the 5th century, when, the city having been visited with earthquakes, fires and other grave calamities, the bishop, Saint Mamertus, ordered a solemn fast and public supplication of three days to appease the divine indignation: and thereafter the three days' supplication was practised annually, the custom spreading throughout Gaul and beyond the Alps. Everywhere these processions were suppressed in England after the triumph of the Reformation, yet in some localities the perambulation of the boundaries of parishes on the 'gang-days' is still kept up.

ROGER I, count of Sicily: b. Normandy, about 1031; d. Mileto, Calabria, 1101. Roger's brothers, Drago, Humphrey, William and Robert Guiscard, had acquired fame in Italy, and obtained possession of the county of Aversa, when he was summoned thither by his brother Robert, and landed in Apulia in 1057. The two brothers, Robert, the eldest, and Roger, the youngest, founded the kingdom of the Two Sicilies. Roger in 1063 defeated the Saracens at Ceramium, and was thereupon confirmed by the pope in all his conquests in Sicily. He took the title of Count of Sicily, and in spite of certain disputes between the brothers, the complete subjugation of Sicily was the result of their joint efforts. After the death of Robert Guiscard in 1085 the Norman power in Italy came into Roger's hands. The general support given to him by the pope freed him from many dangers. In 1098 Urban II gave him a free

brief (the genuineness of which has, however, been questioned), that he would send no legate to Sicily without Roger's consent and left it to him to decide what bishops should attend the general assemblies of the Church and whom he should detain for the service of the kingdom. With this extension of his spiritual rights Rogers introduced many important improvements. Consult Schack, *Geschichte der Normanen in Sicilien* (1889); Caspar, E. L. E., *Roger II* (Innsbruck 1904).

ROGER II, king of Sicily: b. about 1095; d. February 1154, second son of Roger I. His elder brother, Simon, died in 1102, and during his minority the government was administered first by his mother, Adelheid, a daughter of the Margrave Boniface of Montserrat, and then by Prince Robert of Burgundy. The free barons of the land, however, leagued with Pope Honorius II to break the Norman ascendancy. They had no success, and the pope voluntarily confirmed Roger in the possession of Apulia and Calabria. Pope Anacletus extended the confirmation to Capua and Naples; and in 1130 Roger received the title of king. He now pressed so hard upon the barons that Rainulf of Avellino, Robert of Capua, Servius of Naples and others revolted, receiving support from the German and Greek emperors, Lothar and Emmanuel, and the influence of the anti-pope, Innocent, who excommunicated the Sicilian monarch, Roger in 1132 was defeated by them in an engagement; but having promptly assembled a new army suddenly recovered all he had lost, and although the revolt lasted till 1136 it terminated to Roger's advantage. He took Malta and the adjacent islands, and afterward made himself master of Tripoli. With a second fleet he sailed to Madia, and took it in 1148. At the same time he led an expedition against the kingdom of Greece, in which he took Corfu and Thebes, and plundered Corinth, Athens, Cephallonia and Negropont. In 1152 he extended his dominion from Tripoli to Tunis, and from the desert of Mohrab to Kairwan. The peace which followed he turned to good account, reforming the law, introducing order into the administration and patronizing science. Consult *Geschichte der Normanen in Sicilien* (1889); Caspar, E. L. E., *Roger II* (Innsbruck 1904); Curtis, E., *Roger of Sicily* (New York 1912).

ROGER OF HOVEDEN, or HOWDEN, English historian: lived in the last half of the 12th century; d. Hoveden, now Howden, East Riding of Yorkshire. He was a lawyer, in holy orders, and lived at the court of Henry II whom he served in many diplomatic and professional capacities. His latter days were spent as a prebend of the collegiate church at Howden, to which he had retired on the death of his royal master. The history or chronicle which he wrote during his half monastic retirement was based upon *Historia Saxonum vel Anglorum post Obitum Bedæ* (1101). The main additions made by Roger de Hoveden to this work include the miracles of Edward the Confessor; an abstract of the charter by which Hominburgh and Brackenholm were ceded by William the Conqueror to Durham; a list of French knights at the siege of Nice. Naturally the most valuable part of the Chronicle is that which relates to the time in which

Roger lived (1169-92). Edward I in 1291 caused diligent efforts to be made to secure a copy of it, that he might collect therefrom evidence bearing on the vexed question as to the homage due the king of England from the Scottish Crown. The Chronicle was first printed in 1696. Consult Morley, Henry, *English Writers* (Vol. III, London 1864-67).

ROGER OF WENDOVER, English chronicler: d. 1237. He was a monk in Saint Alban's Abbey, and lived to be prior of Belvoir. His chronicle extends down to 1235, and bears the title *'Flores Historiarum'* in the *'Historia Major.'* His account up to 1189 is supposedly based on the compilation of John de Cella, the 21st abbot of Saint Albans. The work was continued by Matthew of Paris. The best edition is by Coxe (4 vols., London 1841-42). The work of Roger is not entirely accurate and trustworthy.

ROGERS, Fairman, American civil engineer: b. Philadelphia, 15 Nov. 1833; d. Vienna, Austria, 23 Aug. 1900. He was graduated from the University of Pennsylvania in 1853, was lecturer on mechanics at Franklin Institute, Philadelphia, in 1853-65, and professor of civil engineering at the University of Pennsylvania 1855-70. He was a volunteer in the Union army in 1861 and completed the survey of the Potomac River northward from Blakiston Island in 1862. He was a trustee of the University of Pennsylvania in 1871-86, presented to the university a valuable library of works on engineering in 1878, and finally resigned his trusteeship because of continued residence abroad. Besides various valuable scientific papers he wrote *'Terrestrial Magnetism and the Magnetism of Iron Ships'* (1883); and *'Manual of Coaching'* (1900).

ROGERS, Henry Darwin, American geologist: b. Philadelphia, 1 Aug. 1808; d. near Glasgow, Scotland, 29 May 1866. He was appointed professor of physical sciences at Dickinson College, Carlisle, Pa., in 1830, studied in London in 1831, was lecturer on geology at Franklin Institute in 1833-34, and in 1835-46 was professor of geology and mineralogy at the University of Pennsylvania. In 1835 he made a geological survey of the State of New Jersey, and was appointed geologist in charge of the survey of Pennsylvania in 1836. The survey was interrupted in 1841-51 by lack of appropriations, and Rogers was engaged as an expert for various coal companies, until he resumed the survey which was then concluded in 1854. The final report of the survey was entrusted to him, and he completed the work in Edinburgh. From 1857 until his death he was professor of geology and natural history at the University of Glasgow. He published *'Description of the Geology of the State of New Jersey'* (1840); *'The Geology of Pennsylvania, a Government Survey'* (1858); numerous geological reports.

ROGERS, Henry Huttleston, American capitalist: b. Fairhaven, Mass., 1840; d. 19 May 1909. He was educated in the schools of his native town, and afterward was connected with the Standard Oil Company, of which he eventually became a large stockholder and a vice-president. He was also president of the

Amalgamated Copper Company (1901); director of the United States Steel Corporation, the National Transit Company and numerous other great corporations. Of the great wealth acquired through his business enterprises he devoted large sums to public and benevolent uses, especially for the benefit of Fairhaven. Among his gifts to the town are two schools, a town hall, the Millicent Library (a memorial to his deceased daughter), a Masonic building, and memorial church buildings, comprising a group said to be excellent examples of Tudor architecture, the church itself being perhaps the finest of its size ever built in America. These buildings were erected in memory of the giver's mother. He also built at Fairhaven, and presented to the Millicent Library, a system of waterworks from which it derives an income; and as superintendent of streets he made, presumably in great part at his own expense, vast improvements in the public highways.

ROGERS, Henry J., American inventor: b. Baltimore, Md., 1811; d. there, 20 Aug. 1879. He is known as the inventor of a code of flag signals, adopted by the United States in 1846, and was also the originator of a code of signals in which colored lights are used. As an associate of Samuel F. B. Morse (q.v.) he was instrumental in constructing the first telegraph line, and was the inventor of several important telegraphic instruments, and was one of the organizers of the first telegraph companies in the United States, the Magnetic Telegraph Company, established in 1845. He served in the Civil War as acting master of the volunteer navy. Subsequently he was prominently identified with the American, the Bankers' and Brokers', the Southern and Atlantic, and the Western Union Telegraph companies. His writings include 'The Telegraphic Dictionary and Seamen's Signal Books' (1845); 'The American Code of Marine Signals' (1854); and, in collaboration with W. F. Larkins, 'Rogers' Commercial Code of Signals for All Nations' (1859).

ROGERS, Henry Wade, American lawyer: b. Holland Patent, N. Y., 10 Oct. 1853. He was graduated at the University of Michigan in 1874 and was admitted to the bar in 1877. In 1883 he became professor in the law school of the University of Michigan and was its dean from 1885 to 1890. From 1890 to 1901 he was president of Northwestern University, and in the latter year became connected with the Yale Law School, where he was dean until 1913. In 1913 he became United States circuit judge. Rogers has been actively engaged in the work of the Methodist Church and has sought in the advancement of legal education, prison reform and the furtherance of peace. He has written 'Illinois Citations' (1881); 'Expert Testimony' (1883), and 'Introduction to Constitutional History as seen in American Law' (1889).

ROGERS, Howard Jason, American educator: b. Stephestown, N. Y., 16 Nov. 1861. His early education was obtained in public schools and at the Pittsfield, Mass., High School; after graduation in 1880 he entered Williams College, from which he was graduated A.B. in 1884. He was admitted to the New York State Bar in 1887. From 1884-92 he was

teacher of history and literature in the Albany Boys Academy; superintendent of the New York State Educational Exhibit at the World's Columbian Exposition, Chicago, 1892-94; acting-secretary of the New York commission there, and editor of the official report of the commission, 1894-95; deputy-superintendent of public instruction, New York State, 1895-1901; director of education and social economy for the United States commission at the Paris Exposition of 1900. At the Saint Louis Exposition, 1904, he was chief of the departments of education and of social economy, and also director of congresses and editor of the 'Proceedings' of the International Congress of Arts and Sciences. In April, 1904, he became first assistant commissioner of education of the State of New York, having charge of higher education. He was decorated, in 1901, by the French Republic with the Order of the Legion of Honor of France, and promoted to the rank of officer in 1904; in 1904, by King Victor Emmanuel III of Italy, with the Order of Chevalier of Saint Maurice and Lazare; by King Oscar II of Sweden, with the Order of the North Star; and in 1905 by Emperor William II of Germany, with the Order of the Red Eagle, rank of officer, and by King Leopold II of Belgium with the Royal Order of Leopold.
